The legislation, which seems certain to pass, would establish a special investigatory panel on brain death and organ transplants. The panel is modelled on the US Presidential Commission on Ethical Problems in Medicine and Biomedical and Behavioral Research which, in 1981, accepted that brain death means death. But the new panel will take two to three years to reach its conclusions, which may be far too long for Japan's surgeons.

Already, a Niigata Prefecture hospital group has twice risked prosecution by performing a kidney transplant operation with an organ taken from a brain-dead patient. The first operation, last May, put the group in the odious position of having to face a legal suit for murder. Despite the risk of legal action, several other groups are eager to claim the prize of Japan's second heart transplant. The first, carried out in 1968, brought legal action and vilification for the surgeon concerned.

But now, after twenty years, a new force is propelling Japan towards acceptance of brain death. To Tokyo's embarrassment, Japanese are starting to travel abroad for transplant operations they cannot get at home. Last week, at almost the same time as the Ministry of Health and Welfare announced a new Tokyo research centre to help developing nations learn from Japan's 'advanced medical treatment' system, a fact-finding mission reported that eight Japanese patients were waiting in the Philippines for transplant operations. The mission, led by Representative Taro Nakayama (Liberal Democrat, Osaka), who has been active in promoting the new Diet legislation, also visited Australia, where it found that 22 Japanese had either received, or were waiting for, liver transplants.

With transplant organs in short supply everywhere in the world, Japanese patients in the hospitals of developing nations would seem especially incongruous. The Philippines is already considering legislative action to control visits by foreign patients.

Early last year, it seemed that Japan's brain-death problem was about to be resolved when the Japan Medical Association's Bioethics Council released a report urging that, subject to strict conditions, brain death should be accepted as a definition of death. Surgical groups at several hospitals immediately began to file applications with their own hospital ethical boards for permission to perform transplants.

But the momentum began to wane when the Japan Federation of Lawyers Associations announced its opposition to the redefinition of death as brain death until a full social consensus had been reached. Subsequently, in May, the Japanese Society of Psychiatry and Neurology decided to come out against the redefinition.

At nearly the same time, a University of Tokyo patients' rights group instigated legal action for murder against those responsible for the Niigata Hospital kidney transplant. The group's view is that patients' rights are not adequately protected from surgeons wishing to carry out transplant operations. Although that view finds few supporters among physicians, public criticism inhibited further transplants from brain-dead patients in 1988.

The Niigata group censured last year has already performed one kidney transplant from a brain-dead patient this year. According to relatives, the patient had expressed a wish to donate his organs in the event of his death.

Writers of Nihonjinron, a genre that explores supposedly unique characteristics of Japanese culture, have often asserted that the aversion to acceptance of brain death and transplant operations is related to a Japanese view that body and soul are inseparable, or to confucian concepts that the body is a gift from one's parents that cannot be given away. But the Niigata man who left instructions for his organs to be donated is reported to have been much influenced by a television progamme on brain death.

The debate over definition of death has mostly subsided in the United States and Europe, with whole brain death being the commonly accepted criterion. Some have argued for extending the definition to include loss of higher brain function, but this has not gained acceptance. In most countries, solid organs may be retrieved from cadavers only with prior permission from the victim or the permission of relatives after death. But in France there is 'presumed consent', so that organs may be taken if needed over the objections of relatives unless the victim had previously made an express wish to the contrary.

Continuing discontent among Soviet scientists over elections

Moscow

CONTINUING discontent with the Soviet Academy of Science's election of nominees to the Supreme Soviet took an extraordinary turn on 2 February — a public meeting of protest outside the academy's main building in Moscow which lasted for an hour and was attended by 3,000 people.

Although public meetings are becoming a routine part of the process of democratization, the meeting outside the academy was without precedent. It is only fair to say that the academy did nothing to prevent the meeting taking place. Indeed, the ground in front of the building had been cleared of snow on the eve of the meeting, which was entirely orderly. Afterwards, the president of the academy, Guri Marchuk, received a delegation of those present at the meeting.

The issue that has exercised the scientific public is the nomination on 18 January of candidates from the academy to the Congress of People's Deputies. As a result of the voting at that extended meeting of the academy's membership, the candidates who had received most support at meetings of institute personnel were found to be missing from the final lists. Rank-and-file scientists say the outcome shows their wishes have been neglected. The five resolutions passed at the meeting on 2 February show a deep crisis of confidence in the academic community.

The most remarkable occurrence then was the contribution of Academician Vladimir Kudryavtsev, elected a vice-president of the academy only last year and put up at the meeting as the academy's spokesman. As chairman of the disputed election meeting, he could hardly have expected a hearty welcome from his critics, and there were several attempts to shout him down. He deserves praise for his determination to speak out.

"Read the slogans", he said at one point, "but I agree with most of them." " 'No to functionaries from science!' I also say 'No!' 'Scientists for Gorbachev and perestroika!' I also say 'Yes!' 'Let Sakharov, Sagdeev and Likhachev be our deputies!' I voted for them myself!"

Kudryavtsev went on to say that he agreed with the demand that the academy should be restructured and that a public association of scientific workers should be established. Saying that relations between the academy and its institutes should be more democratic, he asked for the meeting's help to this end.

On the outcome of the voting on 18 January, Kondryavtsev said he shared the meeting's "discontent and regret". Several days earlier, the praesidium of the academy had said that the results of the voting had come as a bolt from the blue for everybody. Academician Marchuk said that he had also voted for Sakharov and Sagdeev.

As an observer at the plenary meeting, I had the impression that many leaders of the academy forgot to which body they were electing people, and by what principles and criteria. Counting the number of institutes backing one nominee or another should not have been irrelevant. Many failed to listen to Sakharov's appeal at the beginning of the meeting that there should be more confidence in the institutes' proposals. Although the voting was by secret ballot, the leadership must assume responsibility.

Post-glasnost *Sakharov now free to travel — en route from Italy to Canada (AP).*

It is understood that the central electoral commission has said that there was "no violation of the law that would justify cancellation". But this view was not generally accepted by the commission, which agrees that the law should be further refined and made specific.

The affair is not yet over. One of the demands of the public meeting on 2 February was that the 23 candidates nominated on 18 January should now withdraw. There is also a proposal that the elections due in March should be boycotted to allow voting on a list drawn up by the institutes.

Sakharov, the front runner in the electoral process until 18 January, told me that he has now been nominated by several districts in the Moscow region and is not fully aware "who has appointed me, and where". Several other candidates disappointed at the academy elections, Academicians Dmitry Likhachev and Gavriil Popov, for example, have also been nominated by other constituents. But the fate of the academy's representation in the chamber of deputies will not be known until the special conference of the academy from 18 to 22 March. **Yuri Kanin**

Sagdeev declines to stand in Kazan

Moscow

THERE has been a further escalation of the conflict within the Academy of Sciences over the nomination of candidates for the election of people's deputies. As *Nature* went to press this week, our Moscow correspondent Yuri Kanin learned that Academician Roald Sagdeev has declined to stand as a candidate for the city of Kazan, saying that he will instead "support with all my vigour" the staff of academy institutes in their "just fight against the scientific establishment".

● Kanin writes: Sagdeev has been backed by staffers at 25 research institutes of the academy, but did not make it to the list of candidates put forward by the general meeting of the academy. Instead, he was nominated by the ethnic-territorial district number eleven of the Russian Federation, which consists chiefly of the city of Kazan.

In a cable to the electoral commission of the district, Sagdeev thanks the electorate for having nominated him, hopes that they will instead nominate local followers of Gorbachev's *perestroika* but declined to stand himself.

"I feel obliged", the cable says, "to support with all my vigour the staff of many institutions of the academy in their just fight against the members of the 'scientific establishment' sitting pretty at the academy's headquarters".

In an earlier interview, Academician Vladimir Kudryavtsev, the chairman of the general meeting of the academy at which the disputed nominations were made, explained that he had attended the public meeting in the academy's grounds on 2 February in a personal capacity. Saying that he had been surprised and disappointed by the outcome of the election, he denied the suggestion at the 2 February protest meeting that the list of those nominated had been drawn up by the praesidium of the academy.

Kudryavtsev also explained that while the praesidium has expressed regret at the outcome of the election, it could not have invalidated the result without flouting the procedure adopted at the outset of the election meeting. "Unless we learn to honour the laws, we will return to the times when we could only talk about democracy, while there was none".

Shroud irradiated with neutrons?

Sir — If the shroud of Turin is in fact the burial cloth of Christ, contrary to its recent carbon-dated age of about 670 years (*Nature* **335**, 663; 1988 and **337**, 611; 1989), then according to the Bible it was present at a unique physical event: the resurrection of a dead body. Unfortunately, this event is not accessible to direct scientific scrutiny, but the image on the shroud, which still cannot be duplicated, appears to be a scorch, indicating that the body radiated light and/or heat. It may also have radiated neutrons, which would have irradiated the shroud and changed some of the nuclei to different isotopes by neutron capture. In particular, some ^{14}C could have been generated from ^{13}C. If we assume that the shroud is 1,950 years old and that the neutrons were emitted thermally, then an integrated flux of 2×10^{16} neutrons cm^{-2} would have converted enough ^{13}C to ^{14}C to give an apparent carbon-dated age of 670 years.

This flux of neutrons should have other measurable consequences. The neutron irradiation would probably not have been uniform, for example, so the $^{14}C/^{13}C$ ratio should vary in different parts of the shroud. In addition, other unstable isotopes should have been formed. Several of these isotopes have half-lives long enough that they would still be present, yet short enough that they are not found naturally.

The unstable isotopes most likely to be found in the shroud are ^{36}Cl and ^{41}Ca. The presence of either would confirm that the shroud had been irridated with neutrons. An accurate measurement of the ratio of either ^{36}Cl to ^{35}Cl or ^{41}Ca to ^{40}Ca (see table) would test the prediction of an integrated neutron flux of 2×10^{16} neutrons cm^{-2}. This may not be possible, however, because contamination with new sources of chlorine or calcium may have occurred from washings or other sources since the irridation took place.

THOMAS J. PHILLIPS
High Energy Physics Laboratory,
Harvard University,
Cambridge, Massachusetts 02138, USA

HEDGES REPLIES—The processes suggested by Phillips were considered by the participating laboratories. However, for the reasons given below, the likelihood that they influenced the date in the way proposed is in my view so exceedingly remote that it beggars scientific credulity.

(1) No plausible physical mechanism has been proposed to explain how the resurrection was accompanied by a significant neutron flux. If a supernatural explanation is to be proposed, it seems pointless to make any scientific measurement on the shroud at all.

(2) Assuming a 'scientific' (but not yet articulated) explanation for the neutron flux, it is an amazing coincidence that the neutron dose should be so exactly appropriate to give the most likely date on historical grounds. (Arguably a total of 10^{28} neutrons (the number in a human body) would be available. Using Phillips' figures, this would be sufficient to impart a date of 100,000 years into the future. To produce a date within 100 years of the first recorded history of the shroud implies that the dose has been 'fine-tuned' to better than one part in a hundred million.)

(3) In fact, the dose proposed by Phillips is much too high, as he has not included the neutron capture by nitrogen in the cloth. A not untypical N content in linen is 1,000 p.p.m., for which a thermal neutron flux of 2×10^{13} cm^{-2} (that is, 1,000 times less) would be appropriate. This does not change the basic argument, but changes the chemical implications (even without recoil effects). The three dating laboratories used different types of chemical pretreatments, (for example at Oxford we purified the cellulose), yet obtained equivalent results. This shows that any ^{14}C formed by neutron irradiation behaves chemically in the same way as the original ^{14}C. This is inherently unlikely because the original nitrogen is in a chemically quite different environment.

(4) As Phillips comments, one might expect that the 'irradiation' would be non-uniform. The three samples were contiguous, but at least on a local scale of 10 mm, any such variation was less than 1 per cent.

The lower neutron flux would reduce the conversion of ^{35}Cl to ^{36}Cl, but should still give a ratio significantly above background (if there has been no loss or gain of Cl since). Electron spin resonance signals from the 'irradiation' might also persist. However, such measurements are unlikely to confirm the presence or absence of neutron irradiation with absolute certainty. This, I fear, will not be achieved in a finite number of tests. If we accept a scientific result, we must exercise a critical notion of the probabilities involved. If we demand absolute certainty, we shall have to rely on faith.

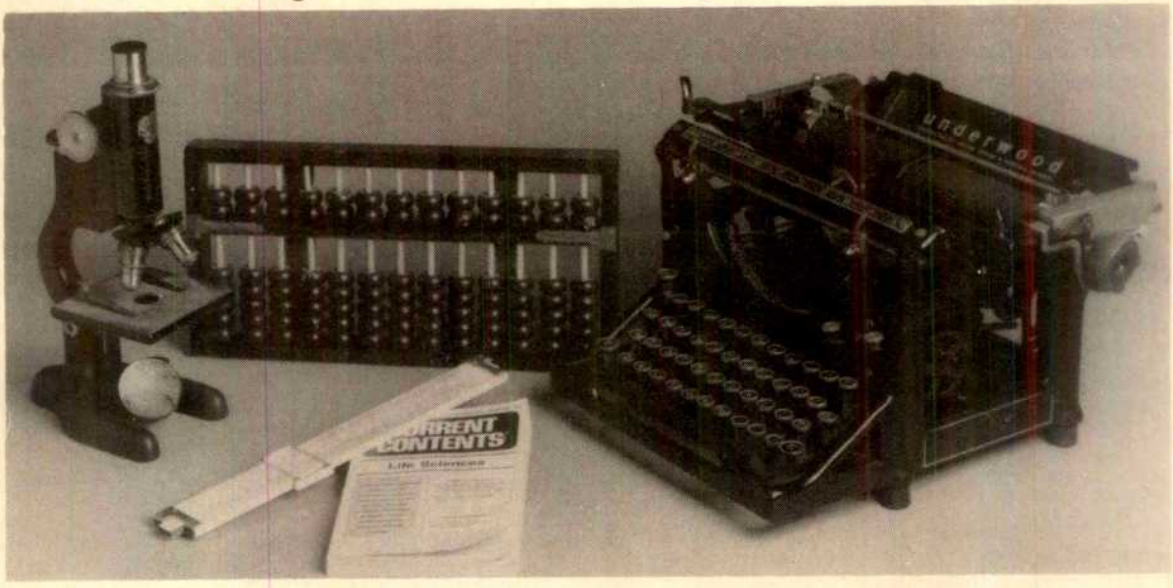
R. E. M. HEDGES
Radiocarbon Accelerator Unit,
Research Laboratory for Archaeology and the History of Art,
University of Oxford,
6 Keble Road, Oxford OX2 3QJ, UK

Properties of selected parent/daughter isotopes

Parent isotope	Natural abundance (per cent)	Neutron capture cross-section (barns)	Daughter isotope	Half-life (years)	Predicted parent/daughter ratio
^{13}C	1.11	0.0009	^{14}C	5,730	1.2×10^{-10}
^{35}Cl	75.77	43	^{36}Cl	3.0×10^{5}	8×10^{-7}
^{40}Ca	96.94	0.40	^{41}Ca	1.0×10^{5}	8×10^{-9}

Predicted parent/daughter ratios (right-hand column) are for a new cloth irradiated with 2×10^{16} neutrons cm^{-2}. For $^{14}C/^{13}C$, the ratio is about 17 per cent higher than normal.

Why reprints are necessary



SIR—Ivor Smith (*Nature* **336**, 708; 1988) complains of receiving reprint requests for a short paper and claims that "the cost of sending for this reprint and the time involved are appreciably greater than walking to the library and making a single photocopy for one's own use". He further suggests that photocopying articles, rather than sending reprint requests, is the "sensible approach".

Perhaps he is correct, if one reads only one short article each week. But in many scientific fields, including my own, one comes across 20–30 articles a week. The cost and time spent walking to the library, finding the articles and photocopying 30 articles is significantly greater than the cost and time required to fill out reprint requests. The volume of research articles is such that only with the time-efficient method of perusing *Current Contents* and requesting reprints of significant articles do I have a hope of having the time to actually read the articles. Thus, for many scientists, the reprints are requested on the basis of the title of the article, which is why it seems to Smith that the requesters have not yet read the article (and apparently will not read the article, considering that they do not receive the reprint).

If it is true that the "European reprint is a disappearing commodity", then perhaps the numbers of scientists reading European articles will be reduced, and European scientists themselves will be even more hard-pressed to keep up with the literature. This may be another funding-related factor which contributes to the decrease in scientific productivity in Britain, lamented in *Nature* over the past two years. Reprints may be expensive, but I believe that they remain the most time-efficient method of article acquisition, and will remain so until the development of 'electronic' journals.

Which of these do you still use?

Throughout history once-useful objects have been rendered obsolete by innovations that made life easier.

REFERENCE *UPDATE*™ is such an innovation — a new concept developed by Research Information Systems, Inc. to enable scientists to keep abreast of the biomedical literature.

Each week subscribers receive a single floppy disk that provides computer-retrievable information encompassing the contents of more than 400 major journals of biology and medicine. Simply request any combination of authors, words in the title, and/or journal names. The references you want immediately appear on the screen. If you wish, REFERENCE *UPDATE*™ will automatically print reprint requests on customized cards. References may be entered directly into your REFERENCE MANAGER® database or transferred into a disk file in a variety of formats.

Your subscription includes a powerful retrieval program which performs all of the search and output functions of REFERENCE *UPDATE*™. You pay no line charges and retrieve only current references — not those you saw last week or last month.

AND THE BEST NEWS...
REFERENCE *UPDATE*™ costs less, only $250.00 per year ($325 in Western Europe)*

Although others may claim to have such a system, you'll find that only RIS has a time-tested, reliable service, already in use by thousands of scientists throughout the world.

A POWERFUL TEAM — REFERENCE MANAGER® and REFERENCE *UPDATE*™
After selecting references from REFERENCE *UPDATE*™ you will want to store them in your own personal database for later retrieval and use in generating bibliographies. REFERENCE MANAGER® is the leading bibliographic management software for scientists[1-5]. And small wonder. This classic program is used by over 10,000 scientists because it is quite simply the most powerful and easy to use product of its kind. References may be entered directly from national databases, from REFERENCE *UPDATE*™, or from the keyboard.

REFERENCE MANAGER® creates bibliographies in the exact format required for publication and inserts the appropriate citations (numbers or authors' names) in the text of your manuscript.

REFERENCE *UPDATE*™ and REFERENCE MANAGER® are available for the IBM PC and compatibles as well as for the Apple Macintosh.

GUIDE TO AUTHORS

Please follow these guidelines so that your manuscript may be handled expeditiously.

Nature is an international journal covering all the sciences. Contributors should therefore bear in mind those readers for whom English is a second language and those who work in other fields. Please write clearly and simply, avoiding unnecessary technical terminology. *Nature*'s staff will edit manuscripts to those ends if necessary. Contributors should check their proofs carefully.

Because of the competition for space, many of the papers submitted for publication cannot be accepted. For this reason, and because brevity is a great assistance to readers, papers should be as brief as is consistent with intelligibility. Please note that one printed page of *Nature*, without diagrams or other interruptions of the text, has fewer than 1,300 words.

CATEGORIES OF PAPER

Review Articles survey recent developments in a field. Most are commissioned, but suggestions are welcome in the form of a one-page synopsis addressed to the Reviews Coordinator. Length is negotiable in advance but must not exceed six pages of *Nature*.

Articles are research reports whose conclusions are of general interest and which are sufficiently rounded to be a substantial advance in understanding. They should not have more than 3,000 words of text or more than six display items (figures and tables) and should not occupy more than five pages of *Nature*.

Articles should be accompanied by a heading of 50 – 80 words written to advertise their contents in general terms, to which editors will pay particular attention. A heading (printed in italic type) is not an abstract and should not usually contain numbers or measurements. The study should be introduced in more detail in the first two or three paragraphs, which should also briefly summarize its results and implications.

Articles may contain a few subheadings of two or three words. The meaning of the text should not depend on the subheadings, whose function is to break up the text and to point to what follows. There should be fewer than 50 references.

Letters to Nature are short reports of outstanding novel findings whose implications are general and important enough to be of interest to those outside the field. Letters should not have more than 1,000 words of text or more than four display items and should not occupy more than two pages of *Nature*. The first paragraph should describe, in not more than 150 words, the origins and chief conclusions of the study. Letters should not have subheadings or more than 30 references.

Commentary articles deal with issues in, or arising from, research that are also of interest to readers outside research. Some are commissioned, most are unsolicited. They are normally between one and four pages of *Nature* in length.

News and Views articles are intended to inform non-specialist readers about a recently published advance. Suggestions should be made to the News and Views Editor. Illustrations are welcome. Proposals for meeting reports should be agreed in advance.

Scientific Correspondence is for the discussion of scientific matters, including contributions published in *Nature*. Priority is given to contributions of less than 500 words and five references. Figures are welcome.

GENERAL

All contributions submitted for publication in *Nature* should conform with these rules.

Manuscripts should be typed, double-spaced, with a good-quality printer, on one side of the paper only. Four copies are required, each accompanied by lettered artwork. Four copies of half-tones should be included. Reference lists, figure legends and so on should be on separate sheets, all of which should be double-spaced and numbered. Copies of relevant manuscripts in press or submitted for publication elsewhere should be included, clearly marked as such. Revised and resubmitted manuscripts should also be clearly marked as such and labelled with their reference numbers.

Titles should say what the paper is about with the minimum of technical terminology and in fewer than 80 characters. Authors should avoid active verbs, numerical values, abbreviations and punctuation and should include one or two key words for indexing purposes.

Artwork should be marked individually and clearly with the author's name, figure number and, when known, manuscript reference number. Original artwork should be unlettered. Ideally, no figure should be larger than 28 by 22 cm. Figures with several parts are permitted only if the parts are closely related, either experimentally or logically. Suggestions for cover illustrations, with captions, are welcome. Original artwork (and one copy of the manuscript) will be returned when a manuscript cannot be published.

Colour Artwork. A charge of £500 a page is made for 4-colour figures. Inability to meet these costs will not prevent the publication of essential colour figures if the circumstances are explained.

Figure legends must not exceed 300 words and ideally should be much shorter, and should use telegraphic form wherever possible. The figure should be described first, then, briefly, the method. Reference to a method described elsewhere is preferable to a full description. Methods should not be described in detail in the text.

References should be numbered sequentially as they appear in the text, followed by those in tables and finally those in the figure legends. Reference numbers apply only to papers published or in the press, and a different number should be given to each paper cited. All other forms of reference (including unrefereed abstracts) should be included in the text as personal communication, manuscript in preparation or preprint (with number and institution where appropriate). Text should not be included in the reference list. References should be abbreviated according to the *World List of Scientific Periodicals* (fourth edition, Butterworth, London, 1963 – 65). The first and last page numbers should be cited. Reference to books should clearly indicate the publisher and the date and place of publication.

Abbreviations, symbols, units and Greek letters should be identified the first time they are used. Acronyms should be avoided as much as possible and, when used, defined. Editors will shorten words if necessary. In case of doubt, SI units should be used.

Footnotes should not be used except for changed addresses or to identify the corresponding author if different from the first-named.

Acknowledgements should be brief. Grant numbers and contribution numbers are not allowed.

Submission. *All manuscripts may be submitted to either London or Washington. They should not be addressed to editors by name. Manuscripts or proofs sent by air courier to London should be declared as 'manuscripts' and 'value $5' to prevent the imposition of import duty and value-added tax (VAT).*

Supernova springs new surprise

What seems to be the pulsating star left by the supernova whose explosion was observed two years ago has surprised everybody and could, if confirmed, stand theory on its head.

ASTRONOMERS have been grow ing a little anxious in the past few months, wondering when the pulsar left by the explosion of supernova 1987A would emerge from the cooling remnant. The longer they waited, the more they suspected that the pulsar would be feeble and undistinguished. Instead, if observations announced last week stand up to scrutiny, astronomers are faced with three surprises — and a raft of theoretical puzzles.

The bare facts, given in IAU Circular No. 4735 by John Middleditch of Los Alamos National Laboratory, Carl Pennypacker of Lawrence Berkeley Laboratory and many others, are that optical variations between magnitudes 18 and 19 were detected during a 7-hour observing period on 18 January with the 4-m telescope at Cerro Tololo Observatory in Chile. From these observations comes a pulsar with a period of half a millisecond, making it the fastest known. And there is also an 8-hour variation suggesting that the pulsar is a member of a binary system.

The three surprises are these. How can a new-born pulsar have a sub-millisecond period, when it has been thought for years that pulsars are born rotating perhaps ten times a second? Why is the pulsar's magnetic field so small, which it must be because luminosity goes as the square of the field strength and the fourth power of the rotation rate, and because the pulsar is certainly no brighter than the much more slowly rotating Crab pulsar? And how has it acquired a companion which, had it been present at the time of explosion, would have been sitting in the outer layers of the giant progenitor star?

Most pulsars have periods of some modest fraction of a second; the few with millisecond periods belong (with a couple of exceptions) to binary systems. So, the story goes, all pulsars are born rotating slowly, and spin down as they age. But a pulsar in a close binary can accrete mass from its companion, and be spun up to a millisecond period as mass spirals in, conserving angular momentum. The handful of isolated millisecond pulsars are supposed somehow to have lost their companions, perhaps through encounters with other stars or, as in the celebrated case of PSR1957+20, by blasting them away by radiation.

This tidy picture absolves astrophysicists who calculate the dynamics of supernovae explosions from the immense trouble of dealing with rotation, but the 1968.629-Hz periodicity of the new pulsar changes that picture. Its rotational energy is about the same as its gravitational binding energy, which means that it is on the point of being physically flung apart. (For some theoretical nuclear equations of state, it ought to fly apart, which is another problem.) Moreover, the energy of the explosion was only a small fraction of that now tied up in rotation, which means that refinements of the distribution of angular momentum in the progenitor yield order-of-magnitude effects in the explosion dynamics.

For Stan Woosley of Lick Observatory, who has exploded many stars by computer, the problem is that no one knows the distribution of angular momentum in a giant star, or how to calculate angular momentum transport through a convective turbulent medium evolving on a millisecond timescale.

The angular momentum of a giant star, conserved through collapse to a neutron star, is enough to create a millisecond pulsar. But hoping to follow the collapse in detail, and to make useful predictions about the outcome, is close to impossible.

Woosley is understandably waiting to see whether the observations are confirmed before he attempts to explain the new pulsar, and is not averse to models in which the pulsar was born slow two years ago, but has been spun up by accretion since then. But others, such as Andrew Fabian, of the Cambridge Institute for Astronomy, are sceptical. Although dumping about half a solar mass of material onto a fledgling neutron star could spin it up to a millisecond period, the energy generated would be far above the Eddington limit (meaning that radiation pressure would be enough to repel the infalling material).

The Eddington limit can be evaded, for example by supposing gas to accrete at the equator and radiation to emerge from the poles, but this requires special pleading. And the extra gas must come from somewhere: if the supernova explosion has to be such that the core collapses, the atmosphere is blown off yet a little gas is left stranded for subsequent accretion, the pleading becomes even more special.

Like its rapid rotation, the low magnetic field of the new pulsar will probably just have to be accepted for what it is. The elementary assumption that a pulsar obtains its luminosity from electrons accelerated by the rotating magnetic field leads to a simple relation between brightness, magnetic field and rotation rate. The dipole field strength of the new pulsar can be no more than about 10^9 gauss, whereas 10^{12} gauss is what astrophysicists would have guessed.

If the rapid rotation and low field are odd, the apparent 8-hour orbital period is bizarre to the point of incredibility. The companion apparently has the mass of Jupiter and an orbital radius putting it inside what would have been the outer hydrogen layer of the progenitor.

While it is on the fringes of possibility that a condensed object might have lived for a little while in the cool atmosphere of a giant star, it is quite impossible that any such object could have survived the explosion. Some unusual hypotheses come to mind: if the pulsar was spun up by recent accretion, then the companion could be a blob accreting material; if the core was rotating very fast as it collapsed, then it might have passed through a "dumb-bell" phase and fractured into two pieces.

The recent case of PSR1957+20, in which radiation from a pulsar is presumed to be eroding a nearby companion, suggests to Edmund van den Heuvel of Amsterdam University a similar but more extreme history for the pulsar in SN1987A. Because of its very rapid rotation, the newly formed pulsar may have the power to boil away a companion of one solar mass in a matter only of years, rather than the millions of years taken by PSR1957+20. To do this, a much stronger magnetic field than the simple-minded limit allows is needed but because the system is evidently evolving on a timescale of years, even months, the usual arguments may be quite wrong.

The reality of the 8-hour periodicity is certain to be questioned. But Pennypacker and his colleagues are the best in this business, and they spent several weeks analysing their data because they too were taken aback by what they found. New observations are scheduled two weeks from now. The new pulsar may be a freak but van den Heuvel at least seems prepared for a wholesale revision of ideas: the notion that pulsars are born slow may turn out to be an unfounded guess, an unwarranted extrapolation to the moment of birth from 1000-year old objects such as the Crab pulsar. The infancy of the new pulsar will be followed minutely, and will put adulthood and old age in a new light.

David Lindley

Retroviral proteinases

A second front against AIDS

Tom Blundell and Laurence Pearl

Of all the main infectious diseases in man, those caused by viruses are the greatest challenge to the development of effective drugs. Retroviruses such as human immunodeficiency virus (HIV) code for three enzymes of their own: reverse transcriptase, integrase and proteinase. Attempts to develop drugs have so far focused on the inhibition of the viral reverse transcriptase. This enzyme is the target of AZT, the most effective anti-HIV drug in clinical use. Although screening compounds for antiviral activity could turn up useful drugs, it is knowledge of the three-dimensional structure of the virally encoded enzymes that should allow *de novo* design of compounds with high specificity and low toxicity. The basic data for receptor-based design of a new generation of anti-AIDS drugs are provided by two new X-ray analyses of retroviral proteinases (or proteases). Last week, Wlodawer and colleagues reported the structure of Rous sarcoma virus (RSV) proteinase, and on page 615 of this issue[2], Navia and co-workers report the structure of the enzyme of HIV-1 itself.

Tang *et al.*[3] in 1973 observed an unusual sequence of three amino acids, Asp-Thr-Gly, that occurs at both of the two aspartate residues at the active site of pepsin. Subsequently it was discovered[4] that aspartic proteinases such as pepsin have a bilobal structure with a well-defined cleft. A pseudo dyad relates two similar domains with Asp-Thr-Gly sequences occupying topologically equivalent positions and hydrogen-bonded at the centre of an extended active-site cleft. Both studies[3,4] suggested these proteins evolved from an ancestral dimeric enzyme. Toh *et al.*[5] found clues for a present-day relative of this ancestral aspartic proteinase by identifying a highly conserved Asp-Thr-Gly sequence in retroviral sequences in regions thought to encode the proteinase responsible for maturation of the virus. Alignment of consensus sequences for the retroviral proteinases with the sequences of the two lobes of pepsin-like enzymes[6,7], together with the finding that there is weak inhibition of retroviral proteinases by pepstatin[8], indicated that the retroviral enzyme would be dimeric and have a pepsin-like fold. These observations suggested that retroviral inhibitors, perhaps useful for the treatment of AIDS, might be achieved using the technology previously developed for the design of anti-hypertensive inhibitors of renin[9], an aspartic proteinase related to pepsin.

The newly described crystal structures of the two retroviral proteinases — RSV at high resolution[1] and HIV-1 at medium resolution[2] — confirm the prediction of a dimeric structure with a fold similar to other aspartic proteinases[6]. Each enzyme comprises two subunits, each containing a mixed β-pleated sheet of two intertwined motifs of four strands (a, b, c, d and a′, b′, c′, d′) related by a pseudo dyad as shown in Fig. 1. The active-site Asp-Thr-Gly or Asp-Ser-Gly sequence occurs on the wide loop (c, d) which is crossed by strand d′ to give a PSI-like structure. Although only the RSV, and not the HIV-1 structure is reported at resolution high enough reliably to indicate the side-chain conformations, it appears that both

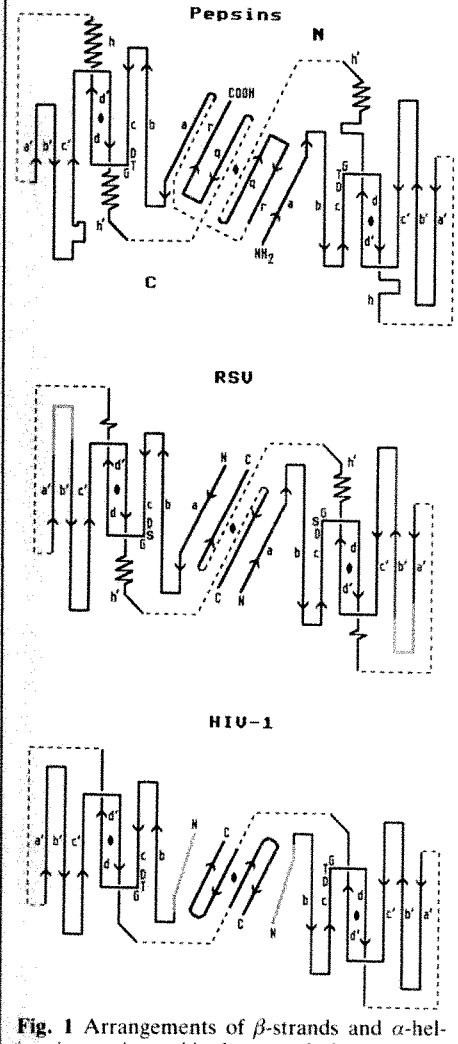

Fig. 1 Arrangements of β-strands and α-helices in pepsins and in the retroviral proteinases of RSV and HIV. In the three-dimensional structures the sequences DT(S)G on strands c are hydrogen-bonded together at the centre of the active-site cleft around the dyad (see Fig. 2). Regions that are unclear in the electron-density maps are shown in grey; dashed lines indicate connections that are short in three dimensions.

enzymes have the characteristic aspartates hydrogen-bonded together at the centre of the active-site cleft[1,2]. The serines or threonines stabilize the symmetrical dimer in an exactly analogous way to pepsin by forming a buried 'fireman's grip' between the subunits[10].

The variations in three-dimensional arrangements of the carboxy-terminal strands and the adjacent amino-terminal strand shown in Fig. 1 reflect the shorter sequences of the retroviral proteinases when compared with the pepsins. Nevertheless, it is suprising that there are differences between the two viral enzymes, including the absence in the HIV enzyme both of a helix in a relatively well-conserved region, h′, and of a clearly defined amino strand. Although these strands are involved in subunit interactions within the dimer, the relative positions of the subunits are well conserved between retroviral proteinases and pepsins. Furthermore, the variations at the chain termini occur mainly on the opposite side to the cleft, and therefore will not greatly affect the pockets that define enzyme catalytic activity or substrate specificity.

The extended hairpin a′, b′, which forms the 'flap', also varies greatly, and there is no equivalent of the invariant Tyr 75 of pepsins that may stabilize the transition state[9]. In fact, the end of the flap of RSV proteinase cannot be seen in the electron-density map even at 2 Å resolution[1], indicating high mobility. By contrast, the two flaps of the HIV proteinase are hydrogen-bonded to neighbouring molecules[2], as in penicillopepsin[11], and so, although they are clearly visible, their position may not be relevant to the enzyme in solution. In any event, it seems that the function of one or both flaps in the retroviral enzymes is to interact with the substrate and to exclude water from the substrate-binding site.

Comparisons and analogies between the structures of retroviral and aspartic proteinases should be useful for the design of HIV proteinase inhibitors. Although the two subunits are completely symmetric in retroviral proteinases, the substrate is asymmetric. Consequently, identical regions in the two subunits must interact with different regions of the substrate on either side of the scissile bond; this may induce asymmetry in the retroviral proteinase itself. By analogy with the pepsins, the substrate binding appears to be achieved by exploiting a weak pseudo symmetry in the substrate[9]. Thus, side-chains of P_1 and P_1' probably bind in identical hydrophobic pockets (Fig. 2). The chain is likely to be positioned by hydrogen bonds between the main-chain amino functions of P_1 and P_2' and the carbonyls of Gly 27 of each subunit of HIV proteinase. A further main-chain interaction at P_3 with the main-chain amide and side-chain oxygen of Thr 219 in

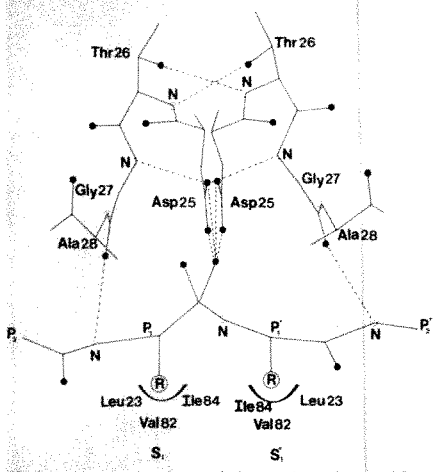

Fig. 2 Arrangements of the active-site residues Asp-Thr-Gly-Ala at the active site of retroviral proteinases, together with a model of the transition state of the substrate based on X-ray studies of analogous pepsins. Dashed lines indicate possible hydrogen bonds. The scissile bond lies between P_1 and P_1'.

pepsins[7,12,13] may be replaced by main-chain amide and side-chain oxygen of Asp 29 in HIV proteinase. The almost invariant Arg 87, which has no analogue in pepsins, appears to be ion-paired to this highly conserved aspartate. Most excitingly, the perfect symmetry of the retroviral proteinases implies that their inhibitors could also have perfect 2-fold symmetry, giving a considerable gain in affinity for the inhibitor relative to the substrate transition state.

What do the crystal structures tell us about the biological function of the proteinase in viral assembly and maturation? The molecules observed in the crystals are not the initially translated forms of the enzymes, but derive from larger precursors. In RSV, the proteinase is synthesized as part of the Gag polyprotein, whereas in HIV it is encoded as part of the Gag–Pol fusion polyprotein. The Gag and Gag–Pol precursors are the native substrates for the viral proteinases. As there is no evidence for involvement of cellular enzymes in the proteolytic processing of Gag and Gag–Pol precursors — in contrast to the processing of the Env precursors — the proteinase must be responsible for the cleavage of its own precursor.

Because the dimer is the active form of the enzyme, the question arises as to whether the precursor cleaves itself or whether it is cleaved by another dimer. Navia *et al.*[2] in this issue suggest that in the HIV proteinase the disordered amino-terminal strands are sufficiently flexible to fold into the active-site cleft so that they can be cleaved by an intramolecular reaction, similar to the mechanism that occurs in pepsinogen[14]. In the RSV structure, however, this strand appears to be well ordered. It is unlikely that the carboxy-terminal strand of either viral enzyme could be cleared intramolecularly without disrupting the integrity of the dimer.

It is the precursor that forms the initial budding 'immature' viral particles, and careful spatial and temporal control of the proteolysis must be important for the production of mature infectious virions. Navia *et al.*[2] suggest that proteinase dimers will be active in a precursor form before budding, but will not cause premature cleavage of membrane-associated Gag precursors because of effective dilution in the large volume of the cell.

There are other mechanisms for control of the initiation of the proteinase cleavage. Aspartic proteinases as a class are optimally active at acidic pH and retroviral proteinases behave similarly. Mammalian aspartic proteinases such as pepsin are synthesized as inactive zymogens and are activated by a drop in pH[15]. A similar mechanism may operate in retroviruses by progressive acidification after budding or by budding into exocytotic vesicles.

Evidence from other retroviruses[16] suggests that proteinase activity might also be dependent upon the correct stoichiometry of the Gag and Gag–Pol precursors and their correct assembly in the icosahedral capsid of the budding virion. It is possible that the precursors occupy special positions in the icosahedral symmetry of the immature virus particle and that the molecular 2-fold axes that generate the active proteinase dimers coincide with the 2-fold axes of the icosahedral immature capsid. □

Microelectronics

Feedback cooling of currents

Sean Washburn

JUST as feedback can be used to correct errors in the output voltages of amplifiers, it can also be used to remove noise from the current through a resistor — including the 'Johnson/Nyquist' noise that results from the thermal motion of electrons[1]. Such a fed-back amplifier behaves as a refrigerator cooling the electrons in a resistor connected to it. This principle has been recognized since the 1940s (ref. 1), but largely ignored because the cooling power available from such refrigerators is minuscule. John Price points out in a new paper[2] that the method might be practical for cooling the currents in (but not necessarily the materials of) the microscopic circuits that are typical of modern electrical engineering and recent studies in transport physics. Because of an analogy to the method used in collimating particle beams in high energy physics experiments, he names the process 'stochastic cooling'.

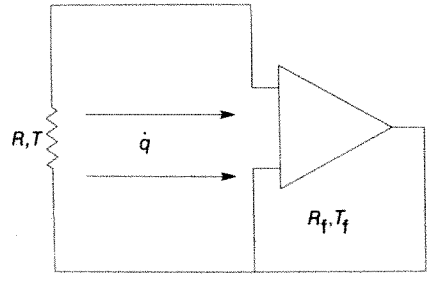

Fig. 1 Circuit diagram of the essential elements of the feedback refrigerator.

The thermal energy associated with a non-zero temperature in materials is distributed not only among the available vibrational motions of the lattice, but also in random agitations of the electrons. These give a finite limit to the precision with which currents can be detected, and appear as noise limiting the sensitivity of any electronic circuit. A brute-force method to reduce the noise is to cool the whole electronic device, say, in liquid helium. But the method discussed by Price represents a more subtle approach to cooling the electrons alone.

In very small, thermally isolated resistors (typical metal wires with volumes less than about 1 μm^3), Price's feedback refrigerator might be sufficiently powerful to lower the electron temperature in the wire from $\lesssim 10^{-2}$ K (a temperature within reach of conventional refrigerators) to less than 10^{-6} K. If accomplished, this would mark a lowering of electron temperatures by more than an order of magnitude below the current record, which is about 10 μK obtained by nuclear demagnetization (cooling of the nuclear-spin temperature)[3,4].

The cooling circuit (Fig. 1) uses an 'active resistor' R_f to absorb energy from a passive resistor R. The noise current from

the resistance R at temperature T is then cancelled by the feedback loop just as other error signals would be cancelled in a more conventional application. A current of heat flows from R to R_t and is dissipated there. Under operating conditions ($T >> T_t$), the heat current or cooling power is $\dot{q} = kT\Delta f$, where kT is the thermal energy of the electrons in R and Δf is the bandwidth of frequencies over which R and R_t communicate. Practically speaking, Δf cannot be much greater than 10 gigahertz (GHz), which means that $\dot{q}$ will not exceed 10^{-12} watts (W), and it is likely to be much smaller. The typical cooling powers from dilution refrigeration or demagnetization are orders of magnitude greater (in the microwatt range) but at concomitantly higher base temperatures[3].

To obtain the lowest electron temperatures, one must employ an amplifier with very low intrinsic noise in making R_t. The best candidate is the superconducting quantum interference device (SQUID) comprising a loop of superconducting material broken at two points by tunnel barriers, especially the double-interferometer or direct-current SQUID. The amplifier works by phase-locking the wavefunctions of 'Cooper' pairs of electrons (which are the basis of superconductivity) across the tunnel barriers. In this case the feedback circuit (operated typically at 4 K) is likely to limit the base effective noise temperature of R_t, but this is quite small in some amplifiers — as low as $T_t \leq 1$ μK (ref. 5) — and the fundamental limit is lower. The output noise from the feedback amplifier could be coupled (very weakly) to another SQUID and be read as an indicator of the electron temperature in the wire. The usefulness of the technique depends on surmounting the two design problems (which Price acknowledges) of reducing the heat flow into the sample below the cooling power of the refrigerator and of making a suitable coupling circuit between the passive resistor and R_t.

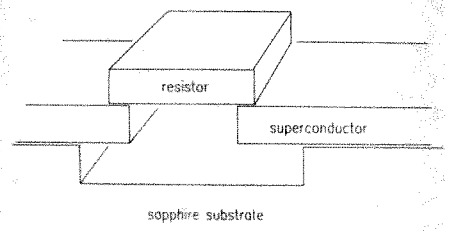

Fig. 2 A possible realization of the refrigerator that thermally isolates the resistor.

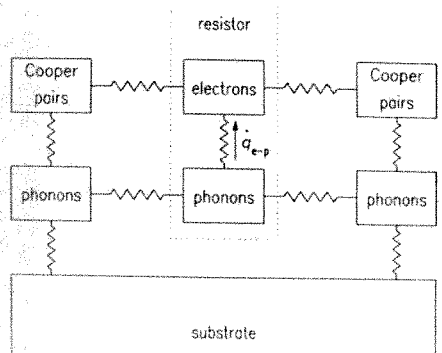
To imbed a thermally isolated resistor into the circuit, Price suggests the use of superconducting contacts. This might be accomplished as in Fig. 2 where the metal wire forms a bridge between the superconductors, which in turn are connected to the rest of the feedback refrigerator. The sapphire substrate is a strong enough thermal conductor to allow a conventional refrigerator to lower the temperature of the whole circuit into the millikelvin range. The feedback refrigerator would then have to surmount the heat leaks shown in Fig. 3. The greatest heat leak into the wire is through the thermal conductance of the superconductors, and at temperatures far below the 'energy gap' of the superconductor this leak is typically[3] (although not always[6]) quite small. At such temperatures, essentially all of the electrons in the superconductor are bound up in Cooper pairs that carry no heat at all.

The only remaining thermal conductance is through vibrations of the lattice (phonons) of the superconductor to the lattice of the wire, and then into the bath of normal electrons in the wire. Again the low temperatures reduce this drastically; the thermal conductivity of the phonons in the lattice falls as the cube of the temperature. The coupling of the energy from the phonons to the electrons in the metal also falls as a power law in the temperature. So overall, at very low temperatures, the electrons are likely to be largely decoupled from the lattice temperature (see Fig. 3).



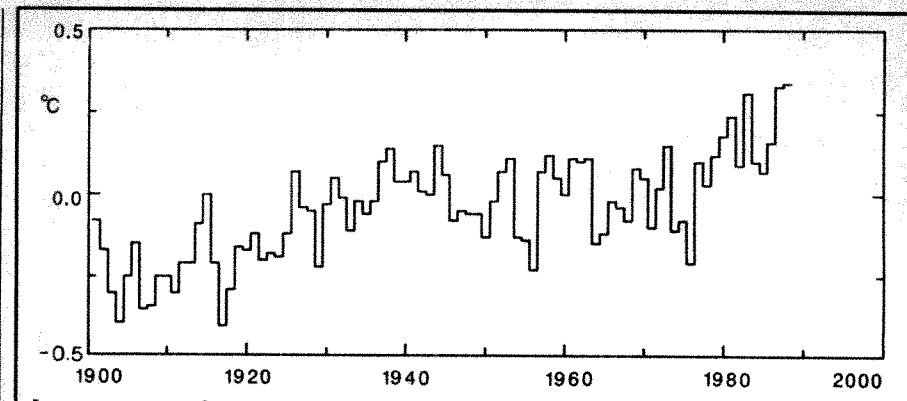


Fig. 3 The heat conduction paths into the resistor in Fig. 2. The circuit elements indicate thermal baths and thermal conductances among them. Measurements[7] indicate that the coupling between the electrons and the lattices is poor even at temperatures ≥ 10 mK. Typically the heat leak from the lattice to the electrons is $\dot{q} = \alpha VT^z$ (V, volume). Because the coupling strength α is rather small[7,8] and the exponent z is large (3–5; ref. 8), this heat leak should be small, so that cooling of the electrons separately from the lattice should be possible.

The problem of the coupling between the passive and active resistors is thorny. It must limit the bandwidth of frequencies between which R and R_t communicate to the range in which R_t exhibits low noise and is capable of cooling, but it must dissipate no energy. Any dissipation in the coupling is noise (increased temperature) that can be dissipated in R. The coupling must therefore comprise purely reactive elements linked by superconducting wires. This in turn causes further complications. The use of superconducting contacts requires that a magnetic field be applied to quench any proximity-effect superconductivity in the resistor. And the magnetic flux in the superconducting elements can lead to dissipation providing a further heat leak.

Assuming that the difficulties in the connecting circuitry can be overcome, Price shows that for reasonable values of resistor size and phonon temperature a conservatively specified direct-current SQUID (noise levels far in excess of the best yet obtained[5]) should be able to cool the electrons in, say, a thin copper film to less than 1 mK. For extreme design criteria, the base temperature might be orders of magnitude lower. □

LAST year was the warmest year since records began. Global temperature records analysed at the UK Meteorological Office and the University of East Anglia show that the global average temperature for 1988 was 0.34 °C above the long-term (1950–1979) average and that eight of the nine warmest years this century have occured in the 1980s. Whether this apparent warming trend is a consequence of the 'greenhouse effect' is moot; as variations ranging from the daily changes in weather to the long-term glaciations show, global temperatures fluctuate considerably owing to natural causes. But the observed warming is consistent with model predictions of the greenhouse effect.

Philippa Lloyd

Multiple sclerosis

Relationship to a retrovirus?

Byron H. Waksman

E. PREMKUMAR Reddy and colleagues at the Wistar Institute in Philadelphia and the University of Lund in Sweden, in the 27 January issue of *Science*[1], describe the identification of DNA sequences corresponding to human T-lymphotropic virus (HTLV-I) in the peripheral blood mononuclear cells of six Swedish multiple sclerosis patients. They also describe their failure to find similar sequences in all but one of twenty healthy controls (ten Swedish and ten North American). Some but not all of the patients are reported to have antibodies against the virus in their blood.

This report is an extension of studies published by the same group 3 years ago[2] in collaboration with Robert Gallo's group at the National Cancer Institute. The new work[1] involves the use of the powerful polymerase chain reaction (PCR), which detects and amplifies low concentrations of viral material, allowing molecular cloning and sequencing of the amplified DNA. The report has, not surprisingly, caused a flurry of excitement in the media, because it suggests a relationship between a retrovirus related to HTLV-I and multiple sclerosis. It does not imply that the retrovirus is the cause of the disease, and the authors do not claim this. But it is possible that these findings will stimulate attempts to develop preventive viral vaccines or therapeutic investigations with drugs which arrest retroviral replication, such as those being developed for the distantly related AIDS virus.

Reddy and collaborators used typical multiple sclerosis patients in their new study[1], many of whom had exacerbating–remitting disease. These were clearly distinct from cases of the slowly progressive, multiple sclerosis-like disease tropical spastic paraparesis, or HTLV-I-associated myelopathy, which is widely distributed in Africa, the Caribbean area and southern Japan. This disease is clearly associated with, and probably caused by, HTLV-I, and clear-cut viral isolation has now been reported by several groups[3,4].

DNA sequences corresponding to both the *gag* and *env* regions of the HTLV-I genome were identified in peripheral blood mononuclear cells from all six multiple sclerosis patients studied by Reddy and collaborators[1]. The results seem persuasive because of the sharp distinction between patients and controls; the concordance of the findings with two different retroviral genes; and the sequencing data provided. At least one other group of investigators, in a study which will shortly appear[5], has succeeded in demonstrating HTLV-I-like DNA sequences in the *pol* and *env* regions in some multiple sclerosis patients but not in normal controls. But when this group used a *gag* primer similar to that used by Reddy *et al.*, all of a series of 21 multiple sclerosis patients, 35 normal controls and 10 cord blood samples gave positive results.

The most interesting possibility raised by the results from both groups[1,5] is that an exogenous retrovirus related to HTLV-I may have a direct causative role in multiple sclerosis. The failure of most laboratories to find antibodies reactive with this virus, and the discrepant antibody finding of Reddy *et al.*[1], speak against this. Another possibility is that Reddy *et al.* are looking at 'endogenous' retroviral DNA sequences, which are widespread in human and other mammalian germline DNA[6]. For some viruses, the complete structure, including *gag*, *pol* and *env* sequences, is often maintained; intact infectious virus is usually not found. At least five known families of retroviruses have been demonstrated in the normal human genome. When supersensitive techniques like the PCR are used, retroviruses resembling HTLV-I can be found in many individuals[6]. But if endogenous retroviral sequences account for the multiple sclerosis results of Reddy *et al.*[1], why were 19 of the 20 controls negative? Results obtained with the PCR technique vary greatly from day to day, and Reddy *et al.*[1] do not report how often they carried out the tests in the multiple sclerosis samples and the controls or even if they ran the multiple sclerosis and control samples concurrently. There is therefore some uncertainty whether the possibility of endogenous sequences is excluded.

Another spectre haunts those who use the PCR technique — the possibility that the test system is contaminated with retroviruses already present in the laboratory. Some take extreme precautions to deal with this possibility, carrying out the PCR in a different laboratory or building than that in which cell separations are done. Contamination can be excluded when the sequences found differ at many positions from all possible contaminants. However, the sequences described by Reddy and colleagues in the multiple sclerosis samples differ only slightly from the comparable sequences of the HTLV-I (derived from patients with tropical spastic paraparesis) studied earlier in the same laboratory. Because the PCR is not an error-free technique, this may be a source of concern.

It is regrettable that the investigators failed to test their techniques on blood cells from patients with diseases related to multiple sclerosis, such as rheumatoid arthritis or juvenile diabetes, or even on mitogen-stimulated normal cells, as the circulating monocytes and lymphocytes of both main subsets are markedly activated in multiple sclerosis, as well as in these other conditions[7]. Cell activation by, for example, phorbol esters results in enhanced retroviral gene expression[6]. Although any possible effect of such activation on the PCR staining of DNA is conjectural, it would be reassuring to know that tests for HTLV-I on activated blood mononuclear cells of such controls were consistently negative.

The pathogenesis of the characteristic inflammatory destructive lesions of multiple sclerosis, rheumatoid arthritis, insulin-dependent diabetes, chronic thyroiditis and other similar diseases is explained by many as an immunological reaction to tissue antigen triggered by viral infection (measles, rubella, Epstein–Barr virus) in early life in genetically predisposed individuals[7,9]. This view is based on epidemiological evidence and the study of autoimmune animal models (see my earlier News and Views article[9]), and receives strong support from recent studies of genes associated with susceptibility to multiple sclerosis and of those governing recognition of myelin antigens by T cells. Perhaps an autoimmune reaction can trigger the local expression of exogenous or endogenous retroviral genes, which make a secondary contribution to lesion pathogenesis, but this remains little more than a speculation.

To conclude on a sobering note, one should recall that more than 20 viruses have been incriminated as the possible cause of multiple sclerosis since 1946[10]. In twelve instances, the presumed causative virus was actually isolated from multiple sclerosis patients. Yet none of these candidates has stood the test of time. This underlines the need for further studies in other laboratories to confirm the findings of Reddy *et al.*[1] and for control studies in other neurological and autoimmune diseases. Putting these cautions to one side for a moment, the new findings are among the most interesting to be published in recent years in this difficult field. □

Structure of galaxies

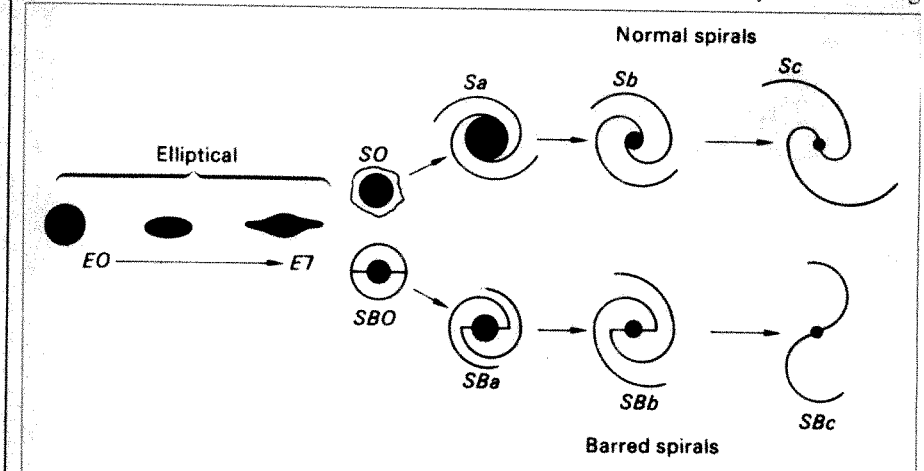
Origin of the Hubble sequence

M.G. Edmunds

MORE than 60 years have elapsed since Edwin Hubble devised his elegant and concise classification system for galaxies (see figure), but we still do not have a good theory of the mechanisms by which the various types arise. A possible pointer to the correct explanation comes from some recent, albeit rather incomplete, dynamical calculations of Lake and Carlberg[1] performed on a Cray X-MP supercomputer. In their simulations, which incorporate dark matter (a common ingredient in cosmological theories[2]), the authors find that the final form of the galaxies depends strongly on the initial spread of velocities in the pre-galactic distribution of dark matter.

Nearly all galaxies have a spheroidal component — a fairly smooth, three-dimensional distribution of old stars. But spiral galaxies (both barred and unbarred) also show a characteristic thin disk of stars, containing gas and dust. The basic questions are what determines whether a galaxy has a disk, and whether the spheroidal components of spirals are really equivalent to elliptical galaxies.

Although there have been alternative proposals, it is usually assumed that elliptical and spiral galaxies formed at about the same time, and that there is no evolution from one type to another. It has long been realized that, if this is true, the critical process determining the basic type of a galaxy must be the time taken for gas to turn into stars compared with the time required for the initial gas cloud to separate out from the primordial matter during the early expansion of the Universe and collapse under its own gravity. If the gas forms into stars quickly enough, the kinetic energy of the collapse is preserved in the stellar motions. Because the stars rarely interact with each other, a spheroidal or ellipsoidal ball of stars results. If the star formation is slower, then much of the gas can collapse into a disk, dissipating its kinetic energy by collisional shocking of the gas before it is converted into stars. This leads to a disk galaxy, with continuing slow star formation in the disk and a modest spheroidal component comprising the stars which did form during the collapse.



The question then becomes one of deciding what it is that regulates the rate of star formation (local gravitational collapse) relative to the rate of the global dynamical gravitational collapse of the whole galaxy. Thus it has been suggested[3] that star formation is promoted by increased local gas density and inhibited by increased angular momentum per unit mass. The latter suggestion is attractive because spirals in general seem to have higher angular momentum than ellipticals.

Lake and Carlberg[1] have found a regulatory mechanism while investigating a dynamical 10,000-particle model. The model follows the fate of gas which collapses with an underlying distribution of dark matter. The latter, commonly assumed to exist in theories of the evolution of the Universe and inferred to exist from observations of galactic dynamics, interacts in the new simulations through its gravitational potential only. The models have essentially 90 per cent of their mass in this dark, unspecified component — the usual inferred ratio. Star formation is simulated by a simple prescription of what happens when the gas 'particles' (or clouds) collide.

The final form of the distribution of stars and gas after collapse is found to depend critically on the magnitude of the random velocity dispersion initially present in the dark matter. The mechanism seems to work as follows. If the velocity dispersion is low (the matter is cold), the dark matter readily clumps together while the initial cosmological expansion changes to gravitational collapse. This clumping causes extensive violent relaxation — energy and angular momentum are redistributed among the particles (the gas clouds and dark matter) during the collapse. It is the transfer of angular momentum outwards in the cloud which is essential. The result is rapid star formation in the by-now dense and low-angular-momentum central regions, giving an elliptical galaxy. An embarrassment is that a high-angular-momentum gaseous halo is left around the outside, but the authors claim that this could easily be removed by other processes during the galaxy's normal evolution. When the initial velocity dispersion in the dark matter is high (it is warm), the clumpy substructure does not form to such an extent and although some relaxation occurs to give a spheroidal component, densities do not get so great until much of the gas, keeping its high angular momentum, has managed to form into a disk, leading to a spiral galaxy.

One advantage of this new picture is that the redistribution of angular momentum during the formation of the spheroids helps to account for the wide differences in angular momentum content between spirals and ellipticals. The extent of this variation is hard to account for in conventional models[4] in which tidal torques between forming galaxies generate the spin.

What is it that ultimately determines the critical velocity dispersion in the dark matter? Lake and Carlberg propose that the overall mass is responsible, with the rather more massive objects becoming elliptical galaxies. The link is not entirely obvious, and they admit that although total mass has often been invoked[5] as a significant parameter controlling the Hubble sequence, it cannot be the whole story because the different Hubble types have overlapping mass ranges[6]. In determining the details of form, the ratio of spheroid mass to disk mass is obviously important, as the Hubble classification is to some extent based on the degree of spheroid dominance. But published observational determinations of bulge-to-disk ratios are probably much more unreliable than is often realized — photometric separation of disk and spheroid components is rarely unambiguous — and the mass of the spheroid may be as large as that of the disk in many spiral galaxies[7]. Once set by the initial dynamics, the bulge-to-disk

ratio may well determine the resulting Hubble spiral class by influencing the formation of spiral structure and star formation rates in the disk. The exact conditions required for the presence of a bar remain rather obscure.

These interesting dynamical models have been investigated over only a very small number of possible parameter variations, and other variables still deserve investigation for their possible effect on the final morphological type. This model implies that the era of galaxy formation occurred at a redshift of about three, beyond which only quasars have yet been observed. This work may show that it is futile to attempt to understand the formation process without taking account of the dynamical effects of the dark matter. □

Cell growth factors

Bicarbonate and pH_i response

Roger C. Thomas

MUCH interest was aroused a few years ago by the first report[1] of continuous recording of the intracellular pH (pH_i) response to growth factors in cultured fibroblasts. That the fibroblasts came from human foreskins (*sic*) caused some twinges, but the main interest was the possiblity that growth factors might stimulate growth, at least in part, by increasing pH_i. Moolenaar and his colleagues[1] showed that the pH_i increase was caused by stimulation of Na–H exchange, and later[2] that protein kinase C activation was an intermediate step. But these experiments were done in the absence of bicarbonate, as pointed out at the time in a News and Views article by Boron[3]. On page 648 of this issue[4], Boron and his colleagues now show that the growth factor arginine–vasopressin stimulates HCO_3 transport more than it stimulates Na–H exchange. This result explains the earlier report[5] that in solutions containing HCO_3 and CO_2, there is not only no pH_i increase, but the opposite happens — pH_i decreases.

Boron's group has recently shown[6] that there are three distinct pH_i regulating mechanisms in the renal mesangial cells (related to smooth muscle) which they study (see figure). The first Na–H exchange appears to be the main mechanism for extruding acid from mammalian skeletal muscle[7], and was until recently thought to be the main mechanism for acid extrusion in all mammalian cells. The second, sodium-dependent Cl–HCO_3 exchange, was first identified in squid axons (but without the sodium dependence[8]) and later found in snail neurons[9], other invertebrate preparations[10] and various vertebrate preparations[11–13]. The third mechanism, as first described in cardiac muscle by Vaughan-Jones[14], is one for alkali extrusion — to accelerate recovery from an alkaline load. This mechanism is simple Cl–HCO_3 exchange, as is also found in red blood cells where it is responsible for the Hamburger interchange or chloride shift. (There is in some preparations a fourth mechanism, Na–HCO_3 co-transport, but mercifully it does not concern us here. Because Boron and colleagues in their latest studies did not record membrane potentials[4], they may have missed evidence for this electrogenic carrier.) The three mechanisms shown in the figure have not hitherto been identified all in one cell type, as far as I know. The only mechanism known to work without bicarbonate is Na–H exchange, inhibited specifically by amiloride and related compounds.

Ionic mechanisms involved in pH_i regulation in renal mesangial cells in the presence of bicarbonate.

Given that growth factors stimulate Na–H exchange it might seem unlikely that they would also stimulate the two bicarbonate-requiring mechanisms in renal mesangial cells. But Boron and his co-workers clearly show[4] that all three mechanisms are stimulated. The dominant mechanism after stimulation is the alkali-extruding one. Thus the pH_i increase seen with growth factor in the absence of bicarbonate is under physiological conditions a pH_i decrease. Clearly, the Na–H exchanger is unlikely to be the transmembrane signal transducer originally proposed[1].

Why was the possible importance of bicarbonate ignored for so long? Its crucial role in pH homoeostasis in the intact animal has long been recognized, if poorly understood by most students. Inside cells, it is often the most common anion, and outside it is the second most common after chloride. But in practice, bicarbonate-buffered solutions are difficult to handle. For a stable pH the solution must be equilibrated with a gas mixture containing a known and fixed percentage of CO_2. Such gas mixtures are expensive and tend to vary from cylinder to cylinder. Carbon dioxide readily crosses plastic, especially silicone rubber tubing and leaves solution all too readily when pumped by a peristatic pump, for example. In many optical systems it is simply much easier to avoid any gas at all.

Thus, when it was discovered that cultured mammalian cells could regulate their pH_i perfectly well with an amiloride-sensitive Na–H exchanger, it was widely assumed that bicarbonate would make no real difference. This assumption ignored the significance of bicarbonate in intracellular buffering[10,15], even without taking into account its requirement by pH_i regulators. Because the membrane is very permeable to CO_2, intracellular carbonic acid concentration is effectively clamped. Thus every intracellular bicarbonation can buffer four times better at any physiological pH than any ordinary buffer at its pK. For fast buffering, carbonic anhydrase is needed[16]. The lack of bicarbonate in the original experiment would thus have exaggerated any pH_i change due to stimulation of Na–H exchange.

There are two conclusions from this story. Intracellular pH is probably too fundamental a parameter to act as an intracellular messenger, even for an event as important as the initiation of growth except perhaps in acid-transporting epithelia[17]. As Boron has pointed out[3], it is to be expected that growth factors will stimulate the housekeeping abilities of the cell such as pH_i regulation, in anticipation of the increased metabolic requirement of growth. The second conclusion is that he who works in bicarbonate-free media risks studying cellular and molecular pathology rather than physiology. □

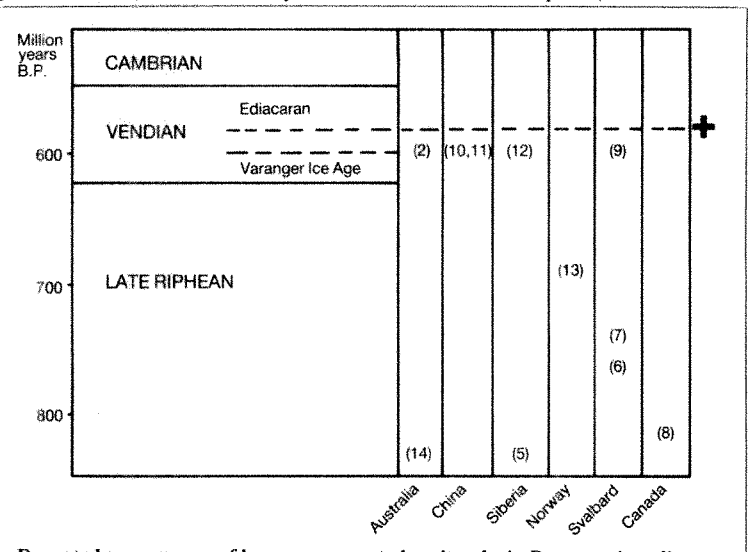
Palaeontology

New window on Proterozoic life



Andrew H. Knoll and Nicholas J. Butterfield

> . . . if my theory be true, it is indisputable that before the lowest Silurian stratum was deposited, long periods elapsed, as long as, or probably far longer than, the whole interval from the Silurian to the present day; and that during these vast, and quite unknown, periods of time, the world swarmed with living creatures.

SURPRISINGLY, it took palaeontologists more than a century to prove the essential correctness of Darwin's speculation[1]. When unambiguously Precambrian microfossils were described from a handful of localities in the 1960s, the minute filaments and unicells preserved in these rocks, notably the Gunflint and Bitter Springs formations, did more than establish the tremendous antiquity of life. They gave rise to a perception of Precambrian communities as vast expanses of cyanobacteria and other prokaryotes, and in younger, Proterozoic rocks, simple, possibly eukaryotic organisms. During the past 20 years, the discrepancy between this well-entrenched textbook notion and palaeontological reality has widened dramatically, as shown by the remarkable new fossil assemblage reported by Zang and Walter on page 642 of this issue[2]. This discovery illustrates the considerable morphological complexity that was attained by late Proterozoic phytoplankton, and underscores the need for careful consideration of stratigraphy, palaeoenvironment and taphonomy (processes of fossilization) in the interpretation of early fossil assemblages.

The new assemblage, found in the 600–650-million-year-old shales of the Pertatataka formation in central Australia, includes about two dozen taxa of spinose, process-bearing or otherwise ornamented acritarchs, many of them extremely large relative to comparably ornamented fossils in younger rocks. (Acritarchs are organic-walled spheroidal microfossils of uncertain taxonomic status. Most are thought to be the cysts of prasinophyte, chromophyte or extinct groups of algae.)

The diversity of this assemblage is unprecedented, but there is a trail of discoveries that leads up to it. Even at the time of the Bitter Springs discovery, populations of morphologically simple acritarchs were known from various Proterozoic shales of the Soviet Union[3]. By the early 1980s, there were enough data on these modestly sculptured acritarchs for a coarse but useful biostratigraphic zonation and to suggest a late Proterozoic diversification of eukaryotic phytoplankton, followed by a latest Proterozoic episode of extinction[4]. Compressions and cellularly preserved remains of seaweeds were also reported, as were vase-shaped protistan microfossils and large, complexly ornamented acritarchs of the type seen in the Pertatataka formation. The latter were first described from approximately 850-million-year-old shales from Siberia[5], and subsequently from slightly younger shales and cherts from Svalbard[6,7] and Arctic Canada[8], as well as from latest Proterozoic rocks of western Svalbard[9], China[10,11] and Siberia[12] (see figure). *Papillomembrana*, a 400–500-μm ornamented vesicle from the approximately 700-million-year-old Biskopås conglomerate, Norway[13], has conventionally been interpreted as a dasyclad alga, but it too probably belongs to this distinctive acritarch grade.

Reported occurrences of large, ornamented acritarchs in Proterozoic sedimentary rocks (references cited in text). The wide geographic and temporal distribution of these fossils suggest the potential for an improved biostratigraphic zonation of late Proterozoic sequences. This distinctive microfossil grade appears not to be represented in Ediacaran or younger assemblages. Absolute dates for microfossil occurrences and stratigraphic boundaries are approximate.

What do these acritarchs reveal about early evolution? The interpretation of fossils begins with systematic palaeontology, and taxonomic choices both reflect and influence the way we think about evolutionary pattern and process. In describing the Pertatataka fossils, Zang and Walter choose generic names that emphasize similarities to younger microfossils. But in our view, a comparison of Pertatataka acritarchs to other Proterozoic fossils is of more interest. Of the 10–15 acritarch genera we believe to be in the Pertatataka assemblage[14], up to a half are unique to this formation, another third are genera previously reported from other Proterozoic formations, and only two or three are most closely related to characteristically Palaeozoic genera — and even here, as Zang and Walter stress, the Pertatataka fossils can be two to three orders of magnitude larger (by volume) than their younger counterparts. Indeed, the most remarkable aspect of these large complex acritarchs is that they do not appear to occur in Lower Palaeozoic rocks. Thus we believe that, together with other recent discoveries, the Pertatataka fossils show that large, complex acritarchs were the characteristic fossils of the later Proterozoic era 900–600 million years ago.

Why is it that assemblages comparable to the Pertatataka were not found, or at least appreciated, earlier? One answer may be that many of these complex microfossils are preserved in subtidal cherts or very fine-grained mudstones, and possibly represent instances of special preservation. Zang and Walter, however, favour an environmental explanation for the unusual composition of their assemblage. They suggest that Pertatataka shales are distal turbidites, a deep-water rock formation little sampled by palaeontologists interested in Proterozoic evolution. The fact that other comparable fossils occur in shallow-shelf deposits, however, suggests that other factors influenced their distribution.

Zang and Walter do not consider biogeographical and stratigraphical distinctions. It is possible, for example, that the morphologically simple acritarchs characteristic of latest Proterozoic shales from

the Northern Hemisphere (mainly in the Soviet Union and Scandinavia) are not strict time equivalents of the Pertatataka biota. In China, large complex microfossils occur in formations immediately beneath strata bearing Ediacaran metazoans, but Ediacaran assemblages in the strict sense appear to consist only of simple spheroidal acritarchs and very small spiny microfossils (*Micrhystridium* spp.)[11], much as in the Soviet Union.

Whatever the answer, Zang and Walter remind us of the untapped potential of Proterozoic fossils, among other things forcing a reconsideration of the timing of Proterozoic phytoplankton radiations and extinctions. The earlier hypothesis of an end-Proterozoic extinction poorly constrained in time but probably coeval with Varangian glaciation must now be replaced by one of a major turnover just before the Ediacaran radiation. Perhaps the most important effect of the Pertatataka and other recently described fossil assemblages will be to displace the textbook caricature of Precambrian life with a view that emphasizes the biological diversity, ecological complexity and evolutionary dynamics of the pre-Ediacaran biota. □

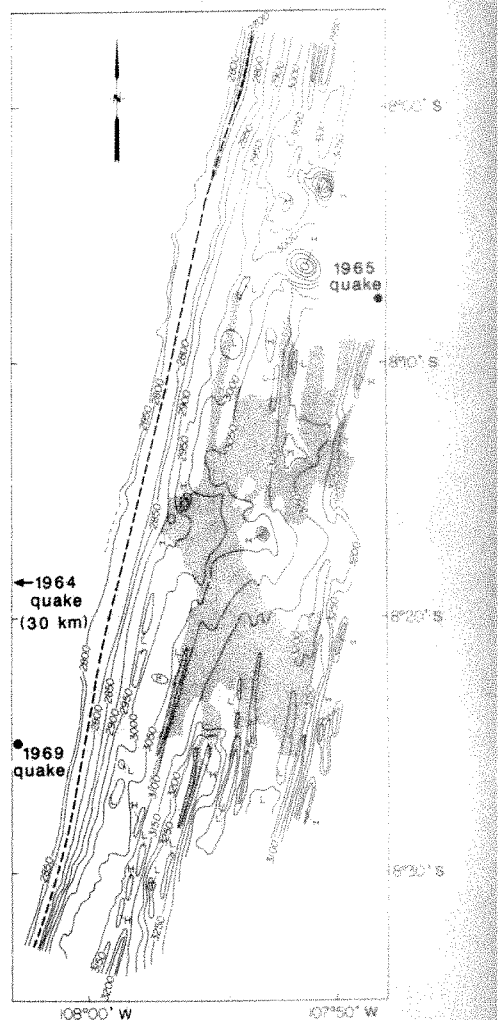
Marine geology

Sea-floor volcano erupts ideas

Joe Cann

Was there a huge volcanic eruption on the floor of the Pacific Ocean in 1965 that covered an area of 220 km^2 with 15 km^3 of basalt lava? Such an eruption would have been comparable to the giant Lakagigur eruption in Iceland in 1783, which erupted 12 km^3 of basalt, poisoned the island's grasslands, killed many of the animals and led to a severe famine[1]. Yet the Pacific eruption was not observed at the sea surface, and the evidence can at present be only circumstantial. But even before its formal publication, the possibility has raised a kaleidoscope of new ideas in areas ranging from plate tectonics through hydrothermal activity to climate change. The case is made by Macdonald, Haymon and Shor in a paper shortly to appear in *Geology*[2] and draws evidence from various sources.

The primary evidence for the eruption comes from a survey of an area of the crest of the East Pacific Rise at 8–9° S. The East Pacific Rise is the mid-ocean ridge that separates the Pacific plate from the Nazca plate. At these latitudes about 0.2 m of new oceanic lithosphere is created on average each year by sea-floor spreading, the fastest rate known anywhere on the global mid-ocean-ridge system. The survey was made with the SeaMARC II towed side-scan sonar vehicle which acoustically measures ocean depths over a swath 10 km wide, and also constructs a side-scan sonar map, on which the intensity of backscattered sound is plotted on each side of the ship's track to show fault scarps (intensely reflecting strips), fissures (parallel shadows and intense reflections) and more complex shapes of volcanic seamounts (see the recent review article[3] by Macdonald *et al.*).



Between 8° 08′ S and 8° 28′ S, over a distance of 35 km, a few kilometres east of the spreading axis, marked here by a 1-km-wide shallow rift valley, appears an irregular area of high reflectivity (see figure). The bathymetry shows this area to be confined to topographic lows, to terminate against fault scarps and against a short chain of craters 3-km east of the rift valley. The plan shape is very similar to that of lava flows on the sea floor and on land, and there can be little doubt that this area is a lava flow emerging from the chain of craters. The thickness was calculated from where the flow abuts fault scarps, and the volume of 15 km^3 follows from the surface area.

How young is the flow? High reflectivity has been correlated in other places with young, glassy lava flows still not covered by sediment. A date in the 1960s is suggested by three earthquakes recorded in 1964, 1965 and 1969 from this general area. It is very unusual to record earthquakes at fast spreading ridges except from the transform faults that offset them and the nearest transform fault is 100-km south of this area.

Suppose the lava flow was erupted in the mid-1960s. Could it be related to a giant plume of ^{3}He-enriched sea water discovered in 1970–72 on the west side of the East Pacific Rise at 13° S by Lupton and Craig[4]? Magma from the Earth's mantle brings ^{3}He up as new lithosphere is created by sea-floor spreading, and can be emitted into the ocean by volcanic gases, or stripped from lavas by hydrothermal solutions. In such young magma, the ^{3}He/^{4}He ratio is 100 times the atmospheric ratio, and inputs to the deep oceans can be traced thousands of kilometres from their source.

The plume was originally ascribed to very active hydrothermal venting at the ridge crest at 13° S carried west by deep ocean currents. Now, Lupton and Macdonald[5] argue that the plume could result from the volcanic eruption at 8° S, and that deep ocean currents would first have carried it south and then west at 13° S. This raises the first of the new ideas that have emerged from this work. The ^{3}He plume has been used to estimate the steady-state hydrothermal flux into the oceans and to suggest that an especially active hydrothermal vent field lies at 13° S on the East Pacific Rise. If it has a volcanic source, that would alter the arguments drastically, and would require a re-examination of the whole question of hydrothermal flux of heat and elements. This idea is readily tested: if the plume was volcanic in origin, it should no longer be present, as eruptions of this kind must be very rare events.

The volume of magma erupted each year along the global mid-ocean-ridge system is about 3 km^3 (assuming the thickness of ocean crust lavas is 1 km, as indicated by ocean drilling and ophiolite stratigraphy). The 8° S eruption would thus account for 5 years' world production of lava. Perhaps more relevant is the lava production at the 75-km-long spreading segment on which the eruption happened.

Map of the East Pacific Rise around 8° S, showing the extent of the lava flow (stippling) and sites of earthquakes in the 1960s. Contours, 50 m; broken line, spreading axis. (From ref. 2; courtesy of K.C. Macdonald.)

At the local spreading rate of 0.2 km yr^{-1}, the flow represents 1,000 years' supply of lava erupted at one place and time.

There are two ways in which new sea floor is created: by magmatic intrusion and extrusion to form new crust; and by stretching of pre-existing crust. When the latter happens on a large scale, as it does in the North Atlantic, the magnetic-anomaly pattern is degraded and outcrops of lower-oceanic crust are found at the sea floor. Such effects would be seen on the East Pacific Rise if eruptions occurred only once every 1,000 yr and each covered less than 10 per cent of the sea floor accessible to major eruptions. In 10,000 yr, about 2 km of new sea floor forms at these fast spreading rates, and most of this would have to be produced by crustal stretching if eruptions were episodic. In fact, the East Pacific Rise has a continuous lava carapace, outcrops are confined to fracture zones, and the magnetic anomaly pattern contains much fine detail. Probably no more than 10 per cent of lava can be erupted in major flows if both of these conditions are to be maintained, which would mean that the world-wide recurrent interval of major flows must be more than 50 yr, perhaps several hundred years. Indeed, the Lakagigur eruption in Iceland may have been the most recent eruption of this kind preceding the Pacific one.

Macdonald *et al.* discuss the effect of the eruption on the axial magma chamber that has been demonstrated to underlie the crest of the East Pacific Rise elsewhere. They estimate that the flow represents about 10 per cent of the volume of the magma chamber, but in doing so, I believe, they overestimate the size of the chamber: the flow may represent as much as half its volume. In either case, the eruption should have resulted in a significant deflation of the ridge crest at least in the local area of the eruptive craters. Yet the ridge-crest morphology is described as inflated and appears so on the map. If this is the case, then the eruption (which emerged apparently not from the crest of the ridge but from the base of the axial high 2–3 km from the spreading axis) must have resulted from some extra inflation, perhaps from the sudden injection of a large volume of new magma into an already inflated magma chamber.

This presents another fascinating aspect of the problem. Recently McKenzie and colleagues[6] succeeded in convincing many volcanologists that magma must dribble out of the mantle as soon as it forms, and that large bodies of magma cannot form within the viscous asthenosphere which underlies the mantle. If here we have a spectacular counter-example, suggesting a sudden input of several cubic kilometres at once into a magma chamber at one place, that would have a profound effect on this line of thought.

By coincidence other apparently young and massive sea-floor lava flows have been discovered recently[7]. But these are not at spreading plate boundaries. Instead they cover large areas of the deep ocean floor around the Hawaiian islands. The flows were discovered during a systematic survey of the US exclusive economic zone with the British side-scan sonar GLORIA. In one place the flows cover 150,000 km^2, and fresh glassy basalt has been recovered, showing that the flows are young. It is not clear whether these flows are related to the island volcanoes (they are found in deep oceans 1–300-km offshore) or to the magmatism of plate boundaries (they are in the centre of the Pacific plate). Whatever the case, they clearly represent another submarine volcanic enigma.

The discovery of these apparently young, large lava flows has led Shaw and Moore[8] to speculate that large sea-floor eruptions might be a trigger for the El Niño climatic fluctuations of the equatorial Pacific. They suggest that the amount of heat released from a young lava flow of this size would be enough to produce sufficient warming of the sea surface layers to generate climatic fluctuations. This, I think, is the easiest of the ideas spawned by the East Pacific eruption to test. Not only would the frequency of such eruptions be too low to generate the observed frequency of El Niño, but Shaw and Moore entirely neglect the problem of getting the heat to the surface. For a plume of hot water to penetrate the stratification of the deep ocean, and then the thermocline, in the well-stratified equatorial Pacific, would apparently require a buoyancy flux of far greater magnitude than could be provided by even a large eruption. Surely that trail must be a dead end.

But if a single observation has generated so many interesting sparks even before its formal publication, there must be fair mileage in it yet. The next step must be to go and examine the lava flow, to collect samples for analysis, to determine its helium-isotope content and to determine its age (which will not be easy). The helium plume must be revisited as a matter of urgency to test that side of the story. Then, of course, it might be a good idea to have another look at the more accessible Lakagigur flow. How does that fit into the scheme of global and Icelandic magma plumbing? How is that related to processes in the mantle and to the history of Icelandic volcanism? We'll see. □

Daedalus

Time is money

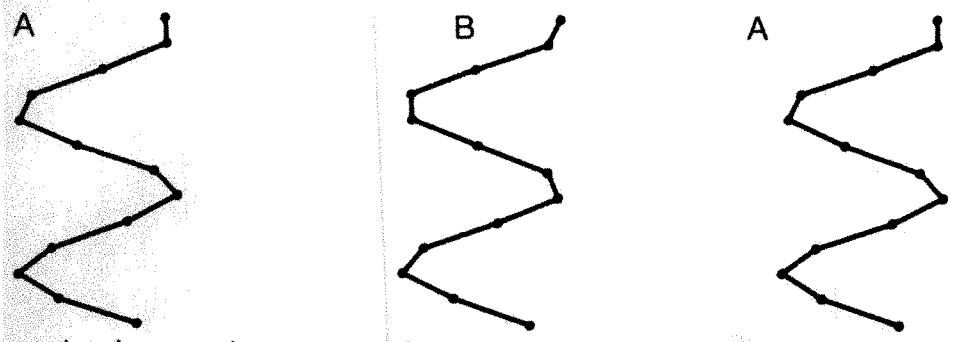
QUEUEING, especially in long institutional queues, implies that while the time of the institution is valuable, that of the queuer is worthless. This outlook probably reaches its high point in the Soviet Union, where you can queue indefinitely for a permit to join another queue; but high marks must also go to the packed waiting rooms and overbooked appointments systems of Britain's much-loved National Health Service.

Daedalus now presents a practical solution. The DREADCO Op-time-miser® is a sort of combined register, computer and vending machine. Installed in (say) a hospital waiting room, it accepts details of each patient to transmit ahead to the doctors. It also notes his time of arrival, and requests him to state the value of his time in pounds per hour. It already has this information for those already present: so it can calculate a 'break-even waiting time' for the group as a whole. Those who value their time highly are assigned a shorter waiting time than this, and pay for the time they save; those who value it modestly wait longer, and are paid their stated rate for the added inconvenience. The 'break-even time' is calculated so that the money paid in by the short-stayers is just sufficient to recompense the long-stayers. The group transaction always breaks even.

Thus the usual dreary waiting for broken appointments is eliminated. Patients just turn up out of the blue and immediately receive an estimate of their waiting time and its likely cost or reimbursement. This time may change as later arrivals modify the optimization; but each queuer knows how much he will be paid for added inconvenience, or charged for speedier service. The rich, as ever, can buy their way to the head of the queue; but the poor are not aggrieved, as they get the money. Nobody will put an absurdly high value on his time; for that increases the chance that he will have to pay out at that rate. But a deposit may have to be charged, to deter healthy layabouts who set a very low value on their time so as to sit endlessly in the warm waiting room at a slowly growing profit.

The Op-time-miser will revolutionize public life. In hospitals, passport offices and unemployment bureaux, wherever an inflexible bureaucracy confronts a resentful public, it will rationalize and smooth their dealings. Daedalus also plans to sell its software to all those booking, repair and installation services that have to juggle unpredictable customer requests into a queue. It will compensate for the sort of maddening delays and broken promises that gave rise to this announcement in the 'Births' column of a British national newspaper: "To Mr and Mrs Smith. Gratefully, after seven years. A telephone". David Jones

Ambiguities in stereopsis



SIR—Stereo-pairs, usually of molecules, are regularly printed in many journals and add a useful third dimension to the traditionally two-dimensional printed page. I wonder, however, how many readers actually see stereo-pairs in three dimensions with correct orientation. An informal poll of my associates reveals that almost no one keeps a stereoscope handy; only about half knew that stereo-pairs could be viewed in three dimensions with the naked eye (direct stereopsis); about a quarter can use direct stereopsis; and only one person knows that a stereo-pair is ambiguous; it does not distinguish between right-handed and left-handed three-dimensional structures.

The ambiguity arises because a stereo-pair can be viewed by two methods[1]. Conventional stereoscopes use the uncrossed visual axes method — lenses, prisms or mirrors cause the right and left eyes to view the right and left members of the pair, respectively. But stereoscopes that use the crossed visual axes method can also be constructed. In these, the right eye views the left member of the pair, and *vice versa*. The depth dimension reverses with a change in viewing method, and the same stereo-pair that gives a right-handed three-dimensional image with one method gives a left-handed image with the other. In effect, the right and left members of the pair are exchanged in position.

Either method can also be used in direct stereopsis[2,3], but the crossed axes method seems easier to learn[2,4]. Therefore, most people who use direct stereopsis will see a reversed image of a printed stereo-pair because the images are usually arranged for conventional stereoscopes, which use the uncrossed visual axes method.

A stereo-triplet (suggested by Bruce Nicklas) consisting of equally spaced members A–B–A, illustrates the reversal (see figure). If A on the right is covered, A and B on the left form a stereo-pair. If A on the left is covered, B and A on the right form the same stereo-pair but with the members exchanged in position. For a given viewing method, the two pairs yield three-dimensional images with reversed depth and handedness. Surprisingly, viewing either pair with all members of the triplet uncovered yields two three-dimensional images side by side, reversed in depth and handedness. In general, a row of n members yields $n-1$ three-dimensional images with a two-dimensional image at each end of the row. This pattern occurs because fusion of the retinal images of any pair shifts the retinal images of the entire row out of register by one member on each retina.

Stereo-pairs as illustrations of three-dimensional objects are now easy to produce with microcomputers and three-dimensional drawing programs. Authors should make such illustrations unambiguous by stating whether they are arranged for viewing with crossed or uncrossed visual axes.

A stereo-triplet of a helical structure. Stereopsis of any two adjacent members yields two three-dimensional images with reversed depth and handedness. With crossed visual axes, the image on the right is right-handed, like a conventional screw thread. With uncrossed axes, it is left-handed.

Earthquake records

SIR—Roger Bilham[1] has made a powerful case for a global approach to the long-term forecasting of earthquakes and, more specifically, for the use of the techniques of space geodesy to detect premonitory ground deformation. Although strain is a fundamental measure of the energy released by earthquakes, it may not always be recognizable at the surface using geodetic techniques. Therefore, we need also to understand the historic and prehistoric record of earthquakes in much greater detail than we do at present.

Long and well-dated earthquake chronologies[2] bring other benefits: they may reveal seismic zones that are temporarily inactive[3] and they are bound to throw light on the mechanisms responsible for the earthquakes[4].

In any case, the geodetic approach requires information on the strain release of a complete earthquake cycle at the site in question. In other words, it will not pay off until the next earthquake. As Bilham observes, that may be decades or centuries in the future: one of the primary tasks of palaeoseismology is to seek out any periodicity (or its lack) in the local occurrence of earthquakes of different sizes.

Island occupation

SIR—In his recent News and Views article[1] on the initial human occupation of the islands of the south-west Pacific, Diamond asked the rhetorical question of whether Pleistocene colonists had managed to reach "only the largest visible targets, leaving Bismarck outliers to be discovered tens of thousands of years later by Lapita explorers?" The answer, as far as a south-eastward thrust down the islands of the Solomon chain is concerned, is no.

Wickler and Spriggs last year investigated[2] Kilu cave on Buka Island, just north of Bougainville Island in the northern Solomons (see map in ref. 1), and found late Pleistocene occupation deposits spanning the period from 20 to 28 kyr ago. These levels contain evidence for the exploitation of marine gastropods, fish and, judging from residue analysis of starch grains on some stone flakes, vegetable tubers. Being an oceanic island, the land fauna is depauperate but included some endemic murids which became extinct, probably because of human impact. This pattern of exploitation is similar to that shown[3] in the Pleistocene occupation levels at the coastal cave of Matenkupkum, New Ireland, 33 kyr ago.

Buka is 175 km away from New Ireland and cannot be seen from there. Between the two islands are the small Feni and Nissan groups, but a journey from New Ireland to Buka via the Feni group would still involve a sea crossing of at least 145 km; and a crossing using both Feni and Nissan groups would be not less than 70 km. Nissan is a coral atoll, and it is not

clear that it was even in existence at that time, as the sea level would have been about 45 m below its present level. The angular target for a voyage directly from New Ireland to the Buka–Bougainville group would have been 30°, and using the island stop-overs, some stages would have had targets as little as 8°.

Once on Buka, the crossings to most of the main islands of the northern Solomons would have been easy as far south as San Cristobal, 1,100 km away. The gap to Santa Cruz probably marked the boundary of Pleistocene occupation. Waisted axe-like tools similar to those dated to 40 kyr ago[4] at the Huon peninsula on the New Guinea coast opposite New Britain have been found on several of the islands of the group. The diversity of human genetics on Bougainville indicates that the islands must have been occupied at least 10 kyr ago[5], a figure that until recently seemed impossible. The colonization of the large islands of the Bismarck and northern Solomons chains occurred soon after that of the Australian–New Guinea continent itself[6]. A sea-crossing capacity, probably denied to the south-east Asian *Homo erectus* populations, was one of the hallmarks of modern man in the region, the events occurring at about the same time that modern *H. sapiens* groups colonized western Europe.

Viral proliferating cell nuclear antigen

SIR—We have identified in the genome of the baculovirus *Autographa californica* nuclear polyhedrosis virus (AcMNPV), a gene that encodes a protein similar to proliferating cell nuclear antigen (PCNA), also termed cyclin[1] or the polymerase-δ auxiliary protein[2,3], which is associated with DNA replication in mammalian cells.

The gene is the previously characterized[4] ETL, which is similar in size to rat PCNA and has 42 per cent amino-acid identity. Conserved sequences are distributed throughout the protein and very few insertions or deletions are required to generate the optimal match (see figure).

Evidence that this viral PCNA is involved in DNA replication is provided by the mutant of AcMNPV, vETLβgal[4], which contains the *Escherichia coli* β-galactosidase gene (*lacZ*) fused to the amino-terminal 165 amino acids of the viral PCNA. This mutant is viable in both insect cell cultures and in perorally infected larvae, but all late viral gene expression, which requires DNA replication, is 4–6 hours later in vETLβgal-infected cells than in wild-type virus-infected cells[4].

Comparison of the amino-acid sequence of ETL[4] (top lines) with rat PCNA[9]. Asterisks, identical residues; lines, substitutions which occur at greater than average frequency among related proteins. Vertical arrow, point at which the ETL sequence is disrupted in vETLβgal.

We have recently confirmed that vETLβgal DNA replication is delayed. Because the mutant virus is viable, however, viral PCNA does not appear to be absolutely required for DNA replication, at least in proliferating cell cultures. Perhaps, viral PCNA is essential for virus replication in nonproliferating, quiescent cells.

In addition to inducing the host DNA polymerase-α[5,6], baculoviruses encode a DNA polymerase[7] which is sensitive to aphidicolin[5,8] and has an associated 3′-to-5′ exonuclease[8], properties shared with DNA polymerases-δ. The induction of these replication-related enzymes may contribute to the ability of AcMNPV to establish an S-phase environment and thereby replicate efficiently in proliferating and quiescent host tissues.

Dystrophin digest

SIR—We have recently reported[1] the localization of a protein of relative molecular mass 210,000 (210K) sharing an antigenic determinant with the 400K dystrophin on the surface membrane of normal human skeletal muscle fibres. Hoffman *et al.*[2] have since suggested that the 210K protein may be a degradation product of dystrophin, and our own data now support this suggestion.

In previous experiments, we found the 210K protein but not the 400K protein in crude and DEAE-cellulose purified low-ionic-strength extracts of skeletal muscle. But when we isolated the protein samples from frozen (−80 °C) or fresh muscle specimens by direct solubilization of tissues in a gel-loading buffer, containing 10 per cent SDS as described by Hoffman *et al.*[3], instead of the 1 per cent SDS used in our previous report, an immunoreactive 400K band could be recovered with our antibody. Further, we found that the antibodies produced by Kunkel's group (30K, 60K) crossreacted with the 210K protein in our low-ionic-strength extract of skeletal muscle.

We now believe that the 210K protein is probably a part of 400K dystrophin, and that native dystrophin, which is extremely susceptible to proteolysis *in vitro*[4], can easily be digested during the preparation process. The digestion may occur at fixed break point(s), because the 210K protein is always observed[1] as a sharp, single band. Thus, the 210K protein presumably represents a stable portion of the 400K dystrophin.

AT LAST a system has been developed for cell biologists and immunologists to obtain the **specific** information they need quickly and easily. The Current Opinion Databases combine **comprehensive computer bibliographies selected by fellow scientists with bi-monthly review journals edited and written by experts** in a unique package tailor-made for the convenience of cell biologists and immunologists.
Every two months subscribers receive on diskette updated bibliographies of the current world literature in cell biology or immunology, and can access comments, selections and annotations by leading specialists on the most interesting papers. The diskettes can be used on IBM PCs or compatibles. The innovative Current Opinion Database software enables users to make complex searches in quick easy stages, to read selections into word processor documents and make print-outs. The accompanying review journals, in addition to providing the bibliographic information in a printed format, feature short, highly illustrated reviews written by experts summarizing the year's developments in cell biology and immunology.

TOGETHER THE CURRENT OPINION ELECTRONIC BIBLIOGRAPHIES AND REVIEW JOURNALS OFFER SCIENTISTS AN INCOMPARABLE INFORMATION SERVICE.

OXFORD UNIVERSITY PRESS

NEW SOFTWARE FROM OXFORD

Desktop Molecular Modeller

Ideal for teaching and research in chemistry, biochemistry, and related subjects

This new and powerful molecular modelling package is menu driven and easy to use. It brings sophisticated construction, manipulation, and calculation techniques to many micro-computer users.

Use Desktop Molecular Modeller to:

- **Display molecules and fragments of up to 1500 atoms:** choose between monochrome line, colour line, stereo line, quick fill, space fill, and ball and stick
- **Manipulate and edit molecules:** break and make bonds, delete and add atoms, and change atom types
- **View molecules:** project structures along the axes of specified bonds or perpendicular to a specified plane; rotate, rescale, and pan molecules on screen in real-time
- **Validate new structures:** check bond lengths, angles, and van der Waals radii, or execute an energy minimization routine
- **Record a 'slide show':** generate sequences of images for demonstration or display purposes

Hardware requirements

IBM PC, XT, AT, or PS/2 microcomputer (and full compatibles); 512K RAM minimum, a hard disk or twin-floppy disk drive, DOS version 2.0 or higher. The program makes optimum use of a variety of display standards (including CGA, EGA, and VGA) and also supports a Microsoft MS-DOS standard mouse (or compatible) and a maths co-processor. (The mouse and co-processor are optional.)

Price

£300 in the EEC/$595 in the rest of the world (excluding postage). UK customers must add VAT at 15%. A 50% academic discount is available and site licences at competitive rates will be offered to recognized educational establishments world-wide.

For further details please complete the order form below.

Oxford Database of Perinatal Trials

The most complete system of identification of clinical experiments in any field of medicine.

With the publication of this database, obstetricians, paediatricians, and researchers no longer need to wade through large and incomplete lists of journal articles to recover reports of various trials. Essential information on randomized perinatal trials is now available at the stroke of a key. Features include:

- Details of over 3000 published reports of randomized controlled trials. Many of the trials cannot be found using subject searches of bibliographies such as *Index Medicus*.
- Reports of unpublished and ongoing trials.
- Key details of each trial, including entry characteristics of participants, interventions studied, and outcome measures used.
- Over 250 overviews (meta-analyses) of results of trials.
- Frequent updates—two updates are planned for 1989.

Hardware requirements

IBM XT, AT, or PS/2 microcomputer (or full compatibles), 12 Megabytes minimum of hard disk storage, IBM-compatible colour graphics adaptor or Hercules graphics card.

Price

£600 in the EEC/$1200 for the rest of the world. UK customers should add VAT at 15%. Updates will be available to subscribers on favourable terms.

Leucocyte Typing Database III

A new software package which allows the manipulation, analysis, storage, and exchange of white cell differentiation antigens. Based on data collected from the Third International Workshop on Human Leucocyte Differentiation Antigens, it also provides a format for the creation of new databases of different antibodies and targets.
Price: £200/$400. 50% academic discount.

The face of justice?

John C. Marshall

Identifying Ivan: A Case Study in Legal Psychology. By Willem A. Wagenaar. *Harvester–Wheatsheaf/Harvard University Press: 1988/1989. Pp. 187. £13.95, $20.*

ALL trials are, or should be, 'show trials'. In accordance with the axiom "Justice must not only be done, but must be *seen* to be done", they should show as unambiguously as possible whether the accused is innocent or guilty as charged. Nazi and Stalinist show trials were obnoxious not because they were spectacles, but because those found guilty were so manifestly innocent.

Last April, a Jerusalem court sentenced John Demjanjuk to death after a trial explicitly stage-managed to remind Israel's youth of the Jewish past in Europe; his appeal is pending. The crime is not at issue. A Ukrainian guard at Treblinka death camp was, in part, responsible for the murder of 850,000 Jews in the gas chambers. The court decided that this man, known to the prisoners as Ivan the Terrible, was John Demjanjuk, a factory worker from Cleveland, Ohio, who had been extradited from the United States to stand trial in Israel. Demjanjuk's defence was simple in principle, although just how complex in fact is revealed by Willem Wagenaar's monograph *Identifying Ivan: A Case Study in Legal Psychology*. The defence was mistaken identity — that Demjanjuk was not 'Ivan'.

Ivan the Terrible? Demjanjuk at a preliminary hearing in 1986.

Willem Wagenaar is a distinguished Dutch scientist who holds the chair of Experimental Psychology at the University of Leiden. His areas of professional competence include the study of memory and perception. He is an acknowledged expert on identification procedures and eyewitness testimony, and it is in this capacity that he agreed to act in the defence of John Demjanjuk. Other equally qualified psychologists had declined to so testify, fearful apparently of the reactions of friends and colleagues. Wagenaar's decision (and the whole tone of his book) is evidence of his intellectual and moral strength; both his character and the technical nature of his testimony have subsequently been vilified and distorted by many who ought to know better.

Quite apart from the specific discussion of Demjanjuk's case, the book is a vivid tutorial on the reliability (or otherwise) of facial identification and the rules for the conduct and interpretation of identity tests. These are areas to which experimental psychologists have made substantial contributions and have succeeded in elucidating a wide range of perceptual, memorial, cognitive and social factors that affect the validity of identification judgements; studies of this topic deliver highly pertinent information to counter those who argue that empirical psychology is conceptually vacuous and socially useless.

Wagenaar summarizes the relevant experimental evidence superbly and provides an acute analysis of its strengths and weaknesses; he falls into neither the trap of assuming that the expert is always right, nor that of dismissing scientific work because the knowledge so obtained is itself limited and fallible. Furthermore, he convincingly relates such laboratory studies to well-documented cases where flaws in line-up and show-up procedures are known (in retrospect) to have resulted in a miscarriage of justice. A number of Wagenaar's conclusions were prefigured in the document prepared by a British advisory committee, chaired by Lord Devlin (1976). Wagenaar pays due tribute to the Devlin Report, although the pace of research has now materially added to the body of information available. His monograph should accordingly be obligatory reading for all judges and lawyers — or better, for all citizens.

The central section of *Identifying Ivan* is a description and justification of 50 procedural rules for the fair conduct of identity parades. They include such seemingly reasonable requirements as (Rule 17): "Witnesses should, before participation in an identification test, be requested to provide a verbal description of the criminal, as they remember him. These descriptions should be included in the reports of the subsequent identity test". And (Rule 21): "The instruction to the witnesses should stress that the wanted person is possibly not in the parade or photospread, and that therefore a positive response should be made only when the witness is certain of recognizing that person".

It is Wagenaar's contention that of the 46 rules applicable to Demjanjuk's case, 28 were directly broken and another nine violated by implication from earlier flaws. Similar procedural errors were made, Wagenaar claims, at the Cleveland trial in 1981 when Demjanjuk's US citizenship was revoked. It is true, as Wagenaar readily concedes, that not all of these rules are accepted as an international standard. Nonetheless, the least that can be said on the basis of his quietly rational documentation is that justice was not *seen* to be done. Such violations could not, of course, occur in Britain. But at a time when the British government is attempting (with some success) to turn the state into an appendage of MI5, we should perhaps be aware of the problem.

Professor Wagenaar does not pretend to the wisdom of Solomon, and he is far too intelligent a man to dispute the verdict of the Jerusalem court. That decision was based upon more evidence than is available to an expert witness for the defence. As Wagenaar states: "The process of translating prior odds into posterior odds is influenced by the experts' likelihoods, but not determined by them". For the reader who wants to know the Truth, Wagenaar "can only refer to the court's verdict". It is, he writes, "the best answer we have".

I do, however, take away from his book one firm conclusion. We can all agree that no legal process will be perfect (at least until the Messiah comes); but there is, to my mind, a strong case to be made that *all* expert testimony should be presented not by 'experts' for the prosecution or the defence, but rather by 'friends of the court'. Until that day, Wagenaar might like to recall an old Yiddish story: The rabbi's wife was convinced that her servant girl was stealing from her. She told the rabbi that she intended to take the girl to court. When the rabbi said that he too would go, the rebbetzin informed him that she knew the law as well as he did and could successfully prosecute on her own. "Ah, yes", said the rabbi, "but who save me will dare to testify in your servant's defence?". □

John C. Marshall is in the Neuropsychology Unit, part of the Neuroscience Group at the Radcliffe Infirmary, Oxford OX2 6HE, UK.

Fields in chaos

Ian Percival

Nonlinear Physics: From the Pendulum to Turbulence and Chaos. By R.Z. Sagdeev, D.A. Usikov and G.M. Zaslavsky. *Harwood: 1988. Pp.675. Hbk $98, £55; pbk $39, £21. Six accompanying diskettes $77, £43.*

THE main authors of this book, Sagdeev and Zaslavsky, have made notable contributions to nonlinear physics. A few years ago Zaslavsky moved from Krasnoyarsk to work with Sagdeev at the Space Institute in Moscow, and the book is one result of their collaboration.

It is an ambitious venture, written for the physicist who wants to use nonlinear dynamics, and includes many analytic and numerical methods and results that have been developed in the past few decades. Its particular strength is the recognition of the important role of chaotic dynamics in many fields, particularly plasma physics. The emphasis is strongly on hamiltonian systems and on applications.

The authors begin with the more traditional methods of hamiltonian dynamics, but from a modern point of view. Then follows a section of special methods; these are largely developments of Poincaré's ideas as tools for applications, but include the KAM theorem. The next hundred pages deal with various aspects of chaos, most of it hamiltonian. There is a short chapter reviewing the principles — which derive largely from the work of mathematicians — and then a long one giving a detailed description of some of the complicated and subtle properties of hamiltonian chaos; most of these have been discovered by numerical experiment using computers, but backed by theory. The next chapter, on kinetic theory, concentrates on those aspects of transport which are of importance in plasma physics.

Part 2, on nonlinear waves, starts with stationary waves, including normal and collision-free shocks, ion-acoustic and magnetosonic waves; the connection made with the theory of particle motion is helpful here. Exactly integrable wave equations are introduced in the context of their applications, and are then treated in more detail later. There follows a description of the hamiltonian formulation, including resonant interaction, resonances and interaction of phonons, and two long chapters on chaos in wave fields and strong turbulence. Strong turbulence is introduced through the Lorenz model, and the distinction between temporal and space-time chaos.

Part 3 gives examples, and is really a collection of bits and pieces that might not have fitted naturally into earlier sections. The first and best is on the motion of particles in wave fields, to which the authors have made important recent contributions and which are illustrated with strikingly beautiful computer-produced colour plates at the end of the book. The second is on billiards, but is too brief to do justice to the subject. The connection with the ray theory of wave optics is considered, but there is no mention of the work of Keller, Maslov, Gutzwiller, Berry and many others on the connection between rays and waves in general, and billiards and cavities in particular.

A later section deals with nonlinear chains, especially with the mathematical equivalence of the equilibrium of incommensurate structures and the dynamics of certain maps. Here, however, there is no description of the Frenkel–Kontorova model, or of Aubry's classic work on its correspondence with the standard map. There are also chapters on applications to nonlinear optics, and to the perturbed Kepler problem (with applications to astronomy and to the excitation of Rydberg atoms). Each provides enough to whet the appetite, but falls far short of being a modern review of the field.

The fourth and final part of the book, by Usikov, is the most unusual. It provides a detailed guide to the programming methods necessary to explore some of the dynamical systems with the aid of an IBM-compatible microcomputer. The detailed listing is not provided, though disks can be obtained at an extra cost.

Part of the problem in writing a book of this kind is that the detailed theory is presented analytically, with some help from geometry, whereas many of the advances are made with the aid of computer experiments, which cannot be put directly into print. So the normal method of presentation is misleading. The final part of the book tries to redress this situation. The 'colour supplement' of orbit simulations is valuable, and will encourage readers to experiment for themselves. But it is not so clear that the computer programs will be so useful, and there is a strong risk that they are becoming outdated — nowadays people use mice!

It is said that Enrico Fermi's use of English was often wrong, but that it was best not to correct it because the errors were minor and had such charm that it was a pity to remove them. Much the same can be said of this book — for example "multiple period birth bifurcations" (p.199) looks more like a term from gynaecology than nonlinear dynamics; but we know what the authors mean. More serious is the use of the words "chaos", "stochasticity" and "turbulence" without the distinctions of modern usage, and the use of "soliton" for interacting solitary waves.

My impression is that the first three parts of the book were written by two busy and productive scientists, who naturally concentrated on the areas to which they have made research contributions. They did not, it seems, have the time to bring all the chapters up to date, nor to provide the polish, revision, indexing, references and cross-references which would have made this a much better volume. For example, although the references provide a guide to some important Soviet literature, they are by no means comprehensive.

Nonetheless this is a valuable contribution to the literature on nonlinear physics. And unlike Zaslavsky's earlier book *Chaos in Dynamical Systems*, which was terribly overpriced, it is very good value for money, especially in paperback. □

Living totem pole — "Young Condor on Post, Steamboat in Background, Jenning's Lodge, Oregon, 1906", a high-quality photograph on a 5 × 7-inch glass plate by W. L. Finley and H. Bohlman. The picture is taken from a chapter on printing old negatives in Alfred A. Blaker's Handbook for Scientific Photography, *2nd edn, just published by Focal Press (an imprint of Butterworth), price $45, £39.95.*

Issues of organic origins

James P. Ferris

The Emergence of Life: Darwinian Evolution from the Inside. By Sidney Fox. *Basic Books: 1988. Pp. 208. $17.95.*

SIDNEY FOX, a pioneer experimentalist on the origins of life, has vigorously promoted research into the subject and his particular approach to it since the 1950s. His work has prompted debate and controversy, and has sparked interest in the field. In *The Emergence of Life*, he summarizes his findings and conclusions for those with a basic understanding of high-school biology. Readers, however, should take to heart the warning to be found in the preface: "I feel comfortable with a frankly acknowledged bias derived from experiments and experience". It appears that bias has indeed played a strong role in the development of his ideas. In this review I will examine in detail two of the basic precepts of Fox's theory which I believe are built on distinctly wobbly experimental foundations.

Polymers

The first is that ordered polymers are formed by the thermal polymerization of amino acids. Fox's view that protein was the basis for the first life stems from his observation that polymers are formed by the dry-phase heating of amino-acid mixtures which contain an excess of either glutamic acid, aspartic acid or lysine up to 80°C. These polymers are not linked simply by peptide bonds; rather, many of the bonds (33–100 per cent in the case of polymers formed with excess aspartic acid) arise from chemical interaction with the carboxyl or amino groups that are not involved in normal peptide bond formation. Fox clearly feels that they are protein-like and justifies this in part because *Chemical Abstracts* indexes them as "thermal proteins". But indexing is one thing, experimental evidence is another.

Is the thermal polymerization of amino acids on the early Earth a plausible idea? It is not beyond the realm of possibility, but other questions remain. For example, how did the excess of acidic or basic amino acids accumulate? Aspartic and glutamic acids are among the more abundant amino acids formed in experiments simulating the primitive Earth. But glycine and alanine are usually formed in much larger amounts, while lysine is formed in trace amounts only. So it is difficult to understand how the basic thermal polymers came into being. Other organic substances may have inhibited the polymerization process because it is highly unlikely that one would find an area on the primitive Earth where only amino acids concentrated. For example, the effect of carboxylic acids and amines on the thermal polymerization of amino acids merits investigation, because they may have accumulated together with acidic or basic amino acids.

It may be possible to overlook problems with the polymerization thesis if Fox's proposal that there are internal limitations on the structures of these thermal polymers is correct. The proposed internal ordering is the basis for an even more controversial assertion — that molecular memory of the type provided by DNA in contemporary life was not essential in the earliest life.

One experiment cited by Fox involved the copolymerization of a 1–2–1 mixture of glutamic-acid–glycine–tyrosine where only two tyrosine-containing tripeptides were isolated from the reaction mixture (higher molecular weight oligomers were also formed). These tripeptides have the composition pyroglu–gly–tyr and pyroglu–tyr–gly. Fox claims that this result is evidence of internal ordering, because there are 19 different ways in which three amino acids containing one or more tyrosines could be linked, yet only two were observed. This reasoning does not stand up to more detailed scrutiny. Polymers form in the presence of glutamic acid because it cyclizes rapidly to pyroglutamic acid first, and then amide bonds are formed with the carboxylic acid or imide groups of the pyroglutamic acid. Consequently, only a glutamic acid residue will be on the amino terminus of the chain. In reality, this is a system where the location of glutamic acid is fixed so only three tyrosine-containing dipeptides will be formed. In the experiment, the molar amount of glycine was initially twice that of tyrosine, and because tyrosine decomposes more readily than glycine under thermal polymerization conditions it is hardly surprising that the trimer containing two tyrosines was not detected among the reaction products. Thus the observation of only two tripeptides is consistent with the known chemistry of the reactants used and cannot be generalized to more complicated mixtures of amino acids.

The complexity of the reaction product mixture formed from 18 amino acids was revealed when it was subjected to DEAE-cellulose chromatography after initial purification by dialysis (Dose, K. & Rauchfuss, H. in *Molecular Evolution, Prebiological and Biological* (eds Rohlfing, D.L. & Oparin, A.I.) 199–217; Plenum, 1972). Preparations which appeared to be homogeneous in gel electrophoresis could be split into more than seven fractions. Even then it was not established that any of the fractions were homogeneous. No self-ordering was observed in this fractionated material, and indeed Fox never reports unambiguous data for self-ordering in thermal polymers. For example, critical experiments to define self-ordering, such as nearest neighbour analysis or sequence specific enzymatic hydrolysis, are not presented.

Protocells

The second of Fox's precepts with which I disagree is that protocells are formed from thermal polymers. When thermal polymers are dissolved in a small amount of boiling water and the mixture is allowed to cool, the polymers (which are insoluble in cold water) precipitate out as spheres 0.5–7 μm in diameter. Fox refers to these particles as microspheres, protocells or primordial cells. Microscopic examination of the particles indicates that there is a dark boundary layer at their surface which looks like a membrane. The apparent presence of boundary material suggested to Fox that if these spheres formed on the primitive Earth, they may have encapsulated other organic material and this system eventually evolved into the first cell. Unfortunately, most of the microsphere material dissolves when the solution in which they form is diluted with water or buffer, while the dark material that looks like a membrane dissolves partially. Fox tested the permeability of this dark material to carbohydrates by forming the microspheres in the presence of solutions of glucose, fructose, starch or glycogen. The microspheres were washed with water and after four washes there was still glycogen or starch remaining in the fraction with the dark material, but fructose or glucose was completely removed. But Fox reports only a few experiments, so it is impossible to determine how much of the original encapsulated carbohydrate remained after washing the microspheres (Fox, S.W. *et al.* in *Physical Principles of Biological Membranes* (eds Snell, F. *et al.*) 417–432; Gordon & Breach, 1970).

Finally, Fox and his colleagues noted in the same article, "How much of this [bound carbohydrate] is attributable to the boundary is not known". Thus, whether the carbohydrate is bound to the dark material or whether it is really retained inside a cavity formed by the boundary material was not established. There are no reports of the encapsulation of authentic protein or nucleic acid within the microspheres. Microparticles (no boundary layer) are formed between lysine thermal polymers and nucleic acids as a result of the charge interaction between the protonated lysine and the phosphate anions of the nucleic acids. One would expect that nucleic acids would be retained inside the microspheres formed from acid thermal polymers if there was any sort of a membrane present, but such studies were not reported. Fox has little experimental support for the assertion that there is a lipid-like membrane at the surface of these microspheres

— it seems that no structural analyses of the presumed boundary material were carried out. The failure to retain thermal polymers, and the absence of data on the retention of protein and nucleic acids, leads me to the opinion that microspheres formed from thermal polymers could not have served to encapsulate the first life on the primitive Earth.

Because these fundamental proposals have such poor experimental support, I am forced to conclude that Fox's theory has little validity. Consequently, the other claims to be found in the book — on the significance of the budding of microspheres, their implied sexuality, the 'membrane' potentials and so on — are meaningless in the context of the origins of life. This is not to say that polypeptides did not have a role in the first life, or that there might have been some sequences that formed more readily than others, but it does not seem likely that proteins with specified sequences formed without some sort of a catalyst (code?) to direct their formation. Investigation of syntheses using conditions that are more selective than dry, thermal polymerization may shed some light on prebiotic peptide formation.

On the positive side, the book provides a lively account of Fox's ideas and of how they developed. Fox is a strong proponent of the view that the most useful insights for the understanding of the origin of life come from knowledge of the products of potentially prebiotic precursors and not from the examination of contemporary and ancient biochemical systems; that is a view that is gaining wider acceptance today. But most of the conclusions that he has drawn far exceed what is justified by the data. □

Set and match

Ian Stewart

Fractals Everywhere. By Michael Barnsley. *Academic: 1988. Pp. 396. £27, $39.95.*

NOT too long ago there was only one book on fractals, Benoit Mandelbrot's *The Fractal Geometry of Nature*. Now there are several, but here we have the first genuine textbook on fractals *as* fractals (the admirable *Geometry of Fractal Sets*, by Ken Falconer, is too much a textbook on geometric measure theory to count here). Michael Barnsley has taught the material at the Georgia Institute of Technology, where his course is open to all students who have completed two years of calculus; the resulting volume could be used by final-year undergraduates or at postgraduate level.

Barnsley concentrates on the mathematics that underlies the theory of fractals: the only application discussed is to data-compression in computer graphics. He takes pains to convey the ideas behind the theorems, using diagrams as well as formal definitions to put across abstract concepts such as metric space, affine transformation and Hausdorff dimension.

The mathematical core of the book is the notion of a self-similar set, which is fundamental to the fractal point of view. A set is self-similar if there exists some finite system of transformations — or iterated function system — such that the images of the set under these transformations, when combined, yield the original set. In other words, the set can be split into a finite number of pieces, each of which has the same structure as the whole, but on a smaller scale. Every iterated function system possesses a unique invariant set — that is, a set which is self-similar under that system. This invariant set is in general a fractal, except for unusual choices of the function system.

One of the central results concerns the 'chaos game'. If an initial point is chosen, and transformations from the function system are applied to it at random to create new points, then with probability one the set of points so formed becomes closer and closer to the unique invariant set for the system. This forms the basis of a computer algorithm for drawing the invariant set. Barnsley deals in depth with the mathematical and dynamical features of the chaos game (including the fractal dimension of the invariant set), alongside its application to computer graphics. The ideas are also extended to a probabilistic version, in which the black-and-white decision 'point' or 'no point' is replaced by shading on a scale of grey. The mathematics behind the famous Mandelbrot set, and its associated Julia sets, is discussed in some detail.

This is a fetching book, with beautiful computer graphics (some in colour), as well as a host of more schematic diagrams, the aim of which is to clarify the abstract mathematics. The fractal ferns, in particular, are quite remarkable, and relate directly to the central ideas. The material is well chosen and hangs together coherently, and the writing conveys a proper sense of excitement. It is true that some of the proofs are tough going, and demand a certain mathematical maturity; but the book can be understood even if the occasional proof is set to one side for future investigation. If you want a genuine understanding of fractals as mathematics, and not just as attractive images, this is an excellent place from which to start. □

Innervative ideas

Alun M. Davies

Body and Brain: A Trophic Theory of Neural Connections. By Dale Purves. *Harvard University Press: 1988. Pp.321. $35, £27.95.*

IT IS common knowledge that the brain controls the body. That the body has an organizing influence on the nervous system is not generally appreciated, yet maturation and growth in all but the simplest of organisms is accompanied by the continuous adaptation of neural connections to the body's changing needs. Purves takes this adaptation as the starting point for the exposition of a trophic theory of neural connectivity. The theory not only provides an important unifying principle in neural development, but has implications for several diverse areas of biological science.

In the context of the nervous system, the term trophic refers to the long-term interdependence between neurons and the cells they innervate. In development, these trophic interactions regulate the size of neuronal populations and have a part in modifying the extent and complexity of neural connections throughout life. Purves presents a comprehensive overview of the foundations of trophic theory from its origins in experimental embryology to our current understanding of its molecular basis.

Alongside the central theme of trophic interactions in development and growth, there is discussion, from an evolutionary standpoint, of the significance of the adaptability of the nervous system to changes in body size and form. The link between neural activity and the modification of connections is examined in terms of trophic theory, an issue which has a bearing on the molecular basis of learning. Finally, Purves evaluates the currently fashionable regressive theories of neural connectivity that are based on a direct analogy between neural development and natural selection. His arguments clearly expose the inadequacies of the naive view that the nervous system develops according to some abstract darwinian principle.

This is a scholarly, thoughtful and well-written book. It will be of value not only to neurobiologists but to anyone interested in basic biological issues. □

NEW Pharmacology Titles from Macmillan

The Focus for Pharmaceutical Knowledge

Edited by **Dennis Burley, Christobel Howard and Brenda Mullinger**
This book is the edited proceedings of the 6th International Meeting of Pharmaceutical Physicians (IFAPP) held at Brighton, UK in 1987. Its 41 chapters cover a wide range of topics including current issues such as improving post-marketing surveillance, the use and abuse of phase IV trials, health care and clinical trials in developing countries.
October 1988 336 pp 234x156 mm **Expected Price £35.00** Hardback 0-333-44356-X

Peptide and Amino Acid Transport Mechanisms in the Central Nervous System

Edited by **Ljubisa Rakic, David J. Begley, Hugh Davson and Berislav V. Zlokovic**
This volume addresses itself to regulation, within the brain extracellular fluid, of peptide and amino acid levels, particularly those which are known or putative neurotransmitters and neuromodulators. Particular attention is also devoted to the way in which peptides may penetrate the blood-brain barrier or alter its permeability to other solutes.
August 1988 352 pp 234x156 mm **Expected Price £40.00** Hardback 0-333-456009

New Concepts in Depression

Edited by **M. Briley and G. Fillion**
A timely collection of results and opinions of the major preclinical and clinical researchers in the field of depression.
April 1988 392 pp 234x156 mm **£45.00** Hardback 0-333-441338

The Detection of New Adverse Drug Reactions Second Edition

M. D. B. Stephens
A practical guide to the collection, assessment and storage of adverse reactions in the development of a new drug. This revised and expanded second edition has also been updated to take into account recent research and legal developments. In addition the reference section has been greatly expanded, to over 500 references.
December 1988 352 pp 234x156 mm **Expected Price £65.00** Hardback 0-333-454170

Very small samples from the Shroud of Turin have been dated by accelerator mass spectrometry in laboratories at Arizona, Oxford and Zurich. As controls, three samples whose ages had been determined independently were also dated. The results provide conclusive evidence that the linen of the Shroud of Turin is mediaeval.

THE Shroud of Turin, which many people believe was used to wrap Christ's body, bears detailed front and back images of a man who appears to have suffered whipping and crucifixion. It was first displayed at Lirey in France in the 1350s and subsequently passed into the hands of the Dukes of Savoy. After many journeys the shroud was finally brought to Turin in 1578 where, in 1694, it was placed in the Royal Chapel of Turin Cathedral in a specially designed shrine.

Photography of the shroud by Secondo Pia in 1898 indicated that the image resembled a photographic 'negative' and represents the first modern study. Subsequently the shroud was made available for scientific examination, first in 1969 and 1973 by a committee appointed by Cardinal Michele Pellegrino[1] and then again in 1978 by the Shroud of Turin Research Project (STURP)[2]. Even for the first investigation, there was a possibility of using radiocarbon dating to determine the age of the linen from which the shroud was woven. The size of the sample then required, however, was ~500 cm^2, which would clearly have resulted in an unacceptable amount of damage, and it was not until the development in the 1970s of small gas-counters and accelerator-mass-spectrometry techniques (AMS), requiring samples of only a few square centimetres, that radiocarbon dating of the shroud became a real possibility.

To confirm the feasibility of dating the shroud by these methods an intercomparison, involving four AMS and two small gas-counter radiocarbon laboratories and the dating of three known-age textile samples, was coordinated by the British Museum in 1983. The results of this intercomparison are reported and discussed by Burleigh *et al.*[3].

Following this intercomparison, a meeting was held in Turin in September–October 1986 at which seven radiocarbon laboratories (five AMS and two small gas-counter) recommended a protocol for dating the shroud. In October 1987, the offers from three AMS laboratories (Arizona, Oxford and Zurich) were selected by the Archbishop of Turin, Pontifical Custodian of the shroud, acting on instructions from the Holy See, owner of the shroud. At the same time, the British Museum was invited to help in the certification of the samples provided and in the statistical analysis of the results. The procedures for taking the samples and treating the results were discussed by representatives of the three chosen laboratories at a meeting at the British Museum in January 1988 and their recommendations[4] were subsequently approved by the Archbishop of Turin.

* Present address: Institut für Mittelenergiephysik, ETH-Hönggerberg, CH-8093, Zurich, Switzerland.

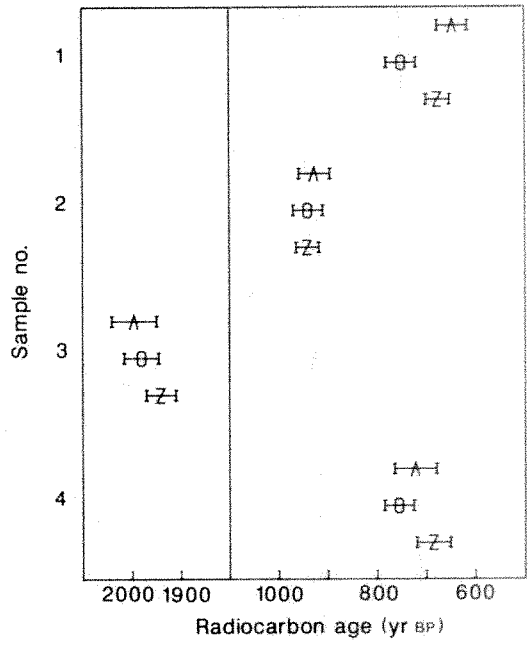

Fig. 1 Mean radiocarbon dates, with $\pm 1\sigma$ errors, of the Shroud of Turin and control samples, as supplied by the three laboratories (A, Arizona; O, Oxford; Z, Zurich) (See also Table 2.) The shroud is sample 1, and the three controls are samples 2–4. Note the break in age scale. Ages are given in yr BP (years before 1950). The age of the shroud is obtained as AD 1260–1390, with at least 95% confidence.

Removal of samples from the shroud

The sampling of the shroud took place in the Sacristy at Turin Cathedral on the morning of 21 April 1988. Among those present when the sample was cut from the shroud were Cardinal Anastasio Ballestrero (Archbishop of Turin), Professor L. Gonella (Department of Physics, Turin Polytechnic and the Archbishop's scientific adviser), two textile experts (Professor F. Testore of Department of Materials Science, Turin Polytechnic and G. Vial of Musée des Tissues and Centre International d'Étude des Textiles Anciens in Lyon), Dr M. S. Tite of the British Museum, representatives of the three radiocarbon-dating laboratories (Professor P. E. Damon, Professor D. J. Donahue, Professor E. T. Hall, Dr R. E. M. Hedges and Professor W. Woelfli) and G. Riggi, who removed the sample from the shroud.

The shroud was separated from the backing cloth along its bottom left-hand edge and a strip (~10 mm × 70 mm) was cut from just above the place where a sample was previously removed in 1973 for examination. The strip came from a single site on the main body of the shroud away from any patches or charred areas. Three samples, each ~50 mg in weight, were prepared from this strip. The samples were then taken to the adjacent Sala Capitolare where they were wrapped in aluminium foil and subsequently sealed inside numbered stainless-steel containers by the Archbishop of Turin and Dr Tite. Samples weighing 50 mg from two of the three controls were similarly packaged. The three containers containing the shroud (to be referred to as sample 1) and two control samples (samples 2 and 3) were then handed to representatives of each of the three laboratories together with a sample of the third control (sample 4), which was in the form of threads. All these operations, except for the wrapping of the samples in foil and their placing in containers, were fully documented by video film and photography.

The laboratories were not told which container held the shroud sample. Because the distinctive three-to-one herringbone twill weave of the shroud could not be matched in the controls, however, it was possible for a laboratory to identify the shroud sample. If the samples had been unravelled or shredded rather than being given to the laboratories as whole pieces of cloth, then it would have been much more difficult, but not impossible, to distinguish the shroud sample from the controls. (With unravelled or shredded samples, pretreatment cleaning would have been more difficult and wasteful.) Because the shroud had been exposed to a wide range of potential sources of contamination and because of the uniqueness of the samples available, it was decided to abandon blind-test procedures in the interests of effective sample pretreatment. But the three laboratories undertook not to compare results until after they had been transmitted to the British Museum. Also, at two laboratories (Oxford and Zurich), after combustion to gas, the samples were recoded so that the staff making the measurements did not know the identity of the samples.

Controls

The three control samples, the approximate ages of which were made known to the laboratories, are listed below. Two were in the form of whole pieces of cloth (samples 2 and 3) and one was in the form of threads (sample 4).

Sample 2. Linen (sample QI.T/32) from a tomb excavated at Qasr Ibrîm in Nubia by Professor J. M. Plumley for the Egypt Exploration Society in 1964. On the basis of the Islamic embroidered pattern and Christian ink inscription, this linen could be dated to the eleventh to twelfth centuries AD.

Sample 3. Linen from the collection of the Department of Egyptian Antiquities at the British Museum, associated with an early second century AD mummy of Cleopatra from Thebes (EA6707). This linen was dated in the British Museum Research Laboratory using liquid scintillation counting, giving a radiocarbon age of 2,010 ± 80 yr BP (BM-2558). This corresponds to a calendar age, rounded to the nearest 5 years, of 110 cal BC–AD 75 cal at the 68 per cent confidence level[5] (where cal denotes calibrated radiocarbon dates).

Sample 4. Threads removed from the cope of St Louis d'Anjou which is held in a chapel in the Basilica of Saint-Maximin, Var, France. On the basis of the stylistic details and the historical evidence the cope could be dated at ~AD 1290–1310 (reign of King Phillipe IV).

Measurement procedures

Because it was not known to what degree dirt, smoke or other contaminants might affect the linen samples, all three laboratories subdivided the samples, and subjected the pieces to several different mechanical and chemical cleaning procedures.

All laboratories examined the textile samples microscopically to identify and remove any foreign material. The Oxford group

‡ Measured for samples 1 and 3; assumed for samples 2 and 4.

§ The loose weave of sample Z3.1 led to its disintegration during strong and weak chemical treatments. Z3.2 was centrifuged to avoid the same loss of material.

‖ Average of separate determinations by AMS.

cleaned the samples using a vacuum pipette, followed by cleaning in petroleum ether (40 °C for 1 h) to remove lipids and candlewax, for example. Zurich precleaned the samples in an ultrasonic bath. After these initial cleaning procedures, each laboratory split the samples for further treatment.

The Arizona group split each sample into four subsamples. One pair of subsamples from each textile was treated with dilute HCl, dilute NaOH and again in acid, with rinsing in between (method a). The second pair of subsamples was treated with a commercial detergent (1.5% SDS), distilled water, 0.1% HCl and another detergent (1.5% triton X-100); they were then submitted to a Soxhlet extraction with ethanol for 60 min and washed with distilled water at 70 °C in an ultrasonic bath (method b).

The Oxford group divided the precleaned samples into three. Each subsample was treated with 1M HCl (80 °C for 2 h), 1M NaOH (80 °C for 2 h) and again in acid, with rinsing in between. Two of the three samples were then bleached in NaOCl (2.5% at pH-3 for 30 min).

The Zurich group first split each ultrasonically cleaned sample in half, with the treatment of the second set of samples being deferred until the radiocarbon measurements on the first set had been completed. The first set of samples was further subdivided into three portions. One-third received no further treatment, one-third was submitted to a weak treatment with 0.5% HCl (room temperature), 0.25% NaOH (room temperature) and again in acid, with rinsing in between. The final third was given a strong treatment, using the same procedure except that hot (80 °C) 5% HCl and 2.5% NaOH were used. After the first set of measurements revealed no evidence of contamination, the second set was split into two portions, to which the weak and strong chemical treatments were applied.

All of the groups combusted the cleaned textile subsample with copper oxide in sealed tubes, then converted the resulting CO_2 to graphite targets. Arizona and Oxford converted CO_2 to CO in the presence of zinc, followed by iron-catalysed reduction to graphite, as described in Slota *et al.*[6]. Zurich used cobalt-catalysed reduction in the presence of hydrogen, as described by Vogel *et al.*[7,8].

Each laboratory measured the graphite targets made from the textile samples, together with appropriate standards and blanks, as a group (a run). Each laboratory performed between three and five independent measurements for each textile sample which were carried out over a time period of about one month. The results of these independent measurements (Table 1) in each case represent the average of several replicate measurements made during each run (samples are measured sequentially, the sequence being repeated several times). The specific measurement procedures for each laboratory are given by Linick *et al.*[9] for Arizona, by Gillespie *et al.*[10] for Oxford and by Suter *et al.*[11] for Zurich. Arizona and Oxford measured $^{14}C/^{13}C$ ratios by AMS and determined the $^{13}C/^{12}C$ ratios using conventional mass spectrometry. Zurich determined both $^{14}C/^{12}C$ and $^{13}C/^{12}C$ quasi-simultaneously using AMS only.

The conventional radiocarbon ages were all calculated using the procedures suggested by Stuiver and Polach[12], with normalization to $\delta^{13}C = -25‰$, and were accordingly reported in yr BP (years before 1950). The errors, which are quoted in Table 1 at the 1σ level (σ is standard deviation), include the statistical (counting) error, the scatter of results for standards and blanks, and the uncertainty in the $\delta^{13}C$ determination (Arizona includes the $\delta^{13}C$ error at a later stage, when combining subsample results; Oxford errors below 40 yr are rounded up to 40).

Results

On completion of their measurements, the laboratories forwarded their results to the British Museum Research Laboratory for statistical analysis. The individual results as supplied by the laboratories are given in Table 1. Each date represents a unique combination of pretreatment and measurement run and applies to a separate subsample, except where indicated by the identification code. From these data it can be seen that, for each laboratory, there are no significant differences between the results obtained with the different cleaning procedures that each used.

Table 2 Summary of mean radiocarbon dates and assessment of interlaboratory scatter

Dates are in yr BP. d.f., degrees of freedom.
* Standard errors based on scatter.
† Standard errors based on combined quoted errors.
‡ The probability of obtaining, by chance, a scatter among the three dates as high as that observed, under the assumption that the quoted errors reflect all sources of random variation.

The mean radiocarbon dates and associated uncertainties for the four samples, as supplied by each of the three laboratories, are listed in Table 2 and shown in Fig. 1. Also included in Table 2 are the overall unweighted and weighted means, the weights being proportional to the inverse squared errors as quoted by the laboratories. The underlying principle of the statistical analysis has been to assume that, unless there is strong evidence otherwise, the quoted errors fully reflect all sources of error and that weighted means are therefore appropriate. An initial inspection of Table 2 shows that the agreement among the three laboratories for samples 2, 3 and 4 is exceptionally good. The spread of the measurements for sample 1 is somewhat greater than would be expected from the errors quoted.

More quantitatively, to establish whether the scatter among the three laboratory means was consistent with their quoted errors, a χ^2 test was applied to the dates for each sample, in accordance with the recommended procedure of Ward and Wilson[13]. The results of this test, given in Table 2, show that it is unlikely that the errors quoted by the laboratories for sample 1 fully reflect the overall scatter. The errors might still reflect the uncertainties in the three dates relative to one another, but in the absence of direct evidence on this, it was decided to give the three dates for sample 1 equal weight in determining the final mean, and to estimate the uncertainty in that mean from the scatter of results.

As shown in Table 2, the unweighted mean of the radiocarbon age of sample 1 and its uncertainty are 691 ± 31 yr BP. The confidence limits for sample 1 were obtained by multiplying the uncertainty by t_d, the value of a Student's t distribution with d degrees of freedom at the appropriate probability level. The value of d, which lies between the inter- and intra-laboratory degrees of freedom—that is, between 2 and 9—was estimated at 5 on the basis of an analysis of variance on the 12 individual measurements supplied by the laboratories[14]. Individual measurements from a particular laboratory were weighted according to their inverse squared errors, but the contributions from different laboratories were weighted equally, thus ensuring consistency with Table 2. Thus for sample 1, where the error has been estimated from the scatter, ~68% and 95% confidence limits for the true radiocarbon date were found from the 1.1σ and 2.6σ errors about the unweighted mean respectively, the multiplying factors being obtained from standard tables of the t_5 distribution. However, for samples 2, 3 and 4, the limits were obtained in the usual way from 1σ and 2σ quoted errors about the weighted means, assuming normality.

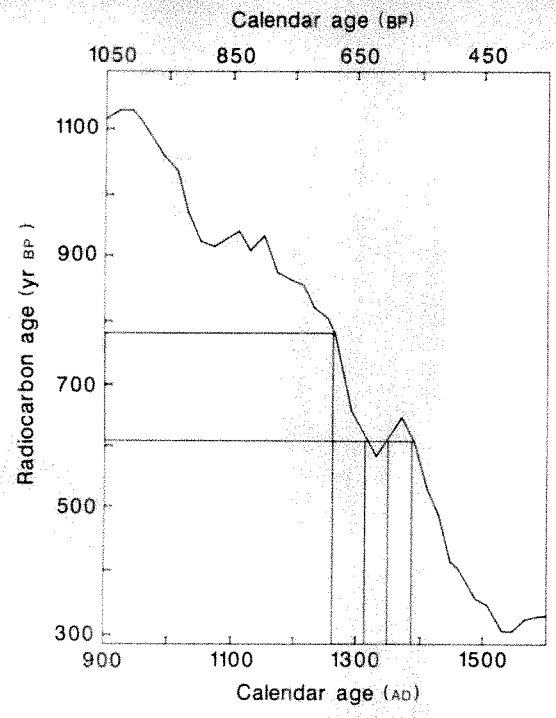

Fig. 2 Calibration of the overall mean radiocarbon date for sample 1 (the Shroud of Turin) using the 'intercept' method. (See also Table 3.) Calibration is necessary because of natural variations in atmospheric ^{14}C. The calibration curve for the relevant period is that of Stuiver and Pearson[5], a portion of which is illustrated. The uncertainty in the calibration curve has been combined with the error in the mean radiocarbon date, giving the 95% confidence limits on the radiocarbon scale; the error envelope on the curve has therefore been omitted from the diagram. The stippled areas show how the 95% confidence limits are transformed from the radiocarbon to the calendar scale.

Table 3 Calibrated date ranges at the 68% and 95% confidence levels

Sample	Mean date (yr BP)		Calendar date ranges
1*	691 ± 31	68%	AD 1273–1288
		95%	AD 1262–1312, 1353–1384 cal
2†	937 ± 16	68%	AD 1032–1048, 1089–1119, 1142–1154 cal

4†	724 ± 20	68%	AD 1268–1278 cal
		95%	AD 1263–1283 cal

* Confidence limits on the radiocarbon scale found from the standard error on the unweighted mean, assuming a t_5 distribution (multiplying factors 1.1 and 2.6 for 68% and 95% limits respectively). Standard error estimated from scatter.

† Confidence limits on the radiocarbon scale found from the standard error on the weighted mean, assuming a normal distribution (multiplying factors 1 and 2 for 68% and 95% limits respectively). Standard error computed from quoted errors.

‡ Date by conventional radiocarbon dating at the British Museum: 2010 ± 80 yr BP (BM-2558).

The calendar-age ranges which correspond to the radiocarbon confidence limits are shown in Table 3. These were determined from the high-precision curve of Stuiver and Pearson[5] based on dendrochronological dating. Method A (the intercept method) in revision 2.0 of the University of Washington Quaternary Isotope Laboratory Radiocarbon Calibration Program[15] was used. In this method, the error in the calibration curve is first incorporated into the radiocarbon error, thus widening the limits on the radiocarbon scale slightly; calendar ages are then found that correspond to these limits, without transforming the complete probability distribution of radiocarbon dates. No additional uncertainty has been added to take account of the short growth period of textile samples. There is little published guidance on this, although it has been suggested that 15 years should be added in quadrature to the overall uncertainty in the radiocarbon date for samples of growth period less than one year, such as linen. In general, such additional uncertainty would widen the 95% calendar limits by ~2–4 years at either end, except for sample 3 where the 9 cal BC limit would be changed to 34 cal BC.

The 95% limits for the shroud are also illustrated in Fig. 2, where it is apparent that the calibration of the radiocarbon date for sample 1 gives a double range. The correct transformation of probability distributions from the radiocarbon to the calendar scale is still subject to debate, there being two different methods of dealing with multiple intercepts. However, both methods agree that the major probability peak lies in the earlier of the two ranges, in the 68% range at the end of the thirteenth century. Sample 4 has a very narrow calendar range: this is due to the steep slope in the calibration curve at this point, and is an occasional instance of calibration reducing rather than increasing a confidence range. Sample 3 compares well with the date obtained by conventional radiocarbon dating; there is no evidence for a difference between the two results. The dates for samples 2 and 4 agree with the historical evidence, which places them in the eleventh to twelfth centuries and late thirteenth/early fourteenth centuries AD respectively.

The results, together with the statistical assessment of the data prepared in the British Museum, were forwarded to Professor Bray of the Istituto di Metrologia 'G. Colonetti', Turin, for his comments. He confirmed that the results of the three laboratories were mutually compatible, and that, on the evidence submitted, none of the mean results was questionable.

Conclusions

The results of radiocarbon measurements at Arizona, Oxford and Zurich yield a calibrated calendar age range with at least 95% confidence for the linen of the Shroud of Turin of AD 1260–1390 (rounded down/up to nearest 10 yr). These results therefore provide conclusive evidence that the linen of the Shroud of Turin is mediaeval.

The results of radiocarbon measurements from the three laboratories on four textile samples, a total of twelve data sets, show that none of the measurements differs from its appropriate mean value by more than two standard deviations. The results for the three control samples agree well with previous radiocarbon measurements and/or historical dates.

We thank Cardinal Anastasio Ballestrero for allowing us access to the shroud, Professor L. Gonella for his help and support throughout the project and Professor A. Bray for commenting on our statistical assessment of the data. We also thank Miss E. Crowfoot, T. G. H. James, Dr J. Evin, M. Prevost-Macillacy, G. Vial, the Mayor of Saint-Maximin and the Egypt Exploration Society for assistance in obtaining the three known-age control samples. Oxford thank P. H. South (Precision Processes (Textiles) Ltd, Derby) for examining and identifying the cotton found on the shroud sample; R. L. Otlet (Isotopes Measurement Laboratory, AERE, Harwell) for stable isotope ratio measurements on two samples; J. Henderson and the Department of Geology, Oxford Polytechnic for undertaking scanning electron microscopy, and SERC for the Special Research Grant which provided the primary support for the Radiocarbon Accelerator Unit. Zurich thank the Paul Scherrer Institut (PSI, CH-5234 Villigen) for technical and financial support. The AMS Programme at Arizona is partially supported by a grant from the NSF.

Three-dimensional structure of aspartyl protease from human immunodeficiency virus HIV-1

The crystal structure of the protease of the human immunodeficiency virus type 1 (HIV-1), which releases structural proteins and enzymes from viral polyprotein products, has been determined to 3 Å resolution. Large regions of the protease dimer, including the active site, have structural homology to the family of microbial aspartyl proteases. The structure suggests a mechanism for the autoproteolytic release of protease and a role in the control of virus maturation.

THE HIV-1 retrovirus has been shown to be the causative agent in AIDS[1,2]. In the course of viral replication, many retroviral structural proteins and enzymes are initially translated as polyproteins which undergo enzymatic cleavage to generate the functional proteins found in mature virions[3]. Genetic and biochemical studies have demonstrated that a virally encoded protease is responsible for the release of structural proteins from the *gag* gene product, and for the release of protease (implying autoproteolysis), reverse transcriptase and integrase from the gag-pol fusion protein[4-8]. Analysis of the sequences of retroviral proteases led to the suggestion that these enzymes were members of the aspartyl protease family, on the basis of the observed conservation of a characteristic Asp-Thr-Gly active-site sequence[9]. HIV-1 protease was found to be inhibited *in vitro* by pepstatin[10-12], a general inhibitor of aspartyl proteases, whose action operationally defines members of this class of enzymes[13]. Furthermore, single amino-acid substitutions of the HIV-1 protease sequence in which the highly conserved Asp 25 was converted to Asn[12,14], Thr[10] or Ala[15] resulted in the elimination of protease activity. Upon transfection into mammalian cells, a provirus containing one of these mutations (Asn 25) was shown to generate non-infectious virions containing unprocessed polyprotein[14]. Consequently, we have focused on HIV-1 protease as a therapeutic target, and have now determined the structure of this enzyme to accelerate the rational design of protease inhibitors as potential agents in the control of AIDS.

HIV-1 protease, with only 99 amino-acid residues[16-19], is the smallest of the retroviral proteases, and is much smaller than the microbial and mammalian aspartyl proteases, each of which contains approximately 325 residues. These pepsin-like enzymes contain homologous N- and C-terminal domains that may have evolved from a primordial gene duplication and fusion event[20,21]. The domains, which are related by an approximate twofold axis of symmetry, each contribute one Asp-Thr-Gly triad to the pseudo-symmetric active site. We show here that in HIV-1 protease, a strict crystallographic twofold relationship exists, in which each monomer contributes one Asp-Thr-Gly sequence to a truly symmetric active site. The structure of this active site, including the interaction of the catalytic aspartic acid residues across the twofold axis, closely resembles the active site of the pepsin-like aspartyl proteases.

Structure of HIV-1 protease

The isolation and crystallization of the HIV-1 protease have been described elsewhere[22]. Details of the structure determination are given in Table 1 legend. C_α coordinates will be deposited with the Brookhaven Protein Data Bank[23].

The tertiary structure of the HIV-1 protease monomer contains exclusively β-sheet, turn and extended polypeptide structural elements. Schematic descriptions of the protease structure are presented in Fig. 1. In the 3.0 Å multiple isomorphous replacement (MIR) electron density map from which this structure was derived, strong, continuous electron density is observed for all but the first five residues at the N terminal (Pro 1 to Leu 5). Chemical sequence analysis of washed crystals, however, confirmed the presence of the correct N-terminal sequence, beginning with Pro 1 (J. Rodkey, unpublished results). We conclude that the first five residues are present in our crystallized protein, but that they are disordered crystallographically, probably because of an inherent flexibility (see below). It should be noted that our current model leaves no regions of electron density in the MIR map unassigned.

In this crystal structure, the two monomer components of each HIV-1 protease dimer are related by a crystallographic twofold axis of symmetry. The overall shape of the dimer is very asymmetric; it can be approximated by an oblate ellipsoid, roughly 55 by 35 by 25 Å. To simplify the description of the dimer, the two monomers will arbitrarily be denoted A and B, even though they are crystallographically equivalent (Fig. 2). The dimer is stabilized by two sets of antiparallel interactions,

‡ Sadly, Dr Irving S. Sigal was killed in the destruction of Pan Am Flight 103 over Lockerbie, Scotland on 20 December 1988.

HIV-1 protease from the NY5 isolate[36] (Pro 1 to Phe 99) was crystallized in space group $P4_12_12$; the crystals have cell constants $a = b = 50.29$ Å and $c = 106.80$ Å. The heavy-atom derivatives used in the structure determination were formed by soaking the crystals in 1 mM solutions of eithe phenyl mercury acetate or lead nitrate for up to 12 hours at 4°C. Before data collection, the crystals were washed and backsoaked for at least 1 hours in the crystallization buffer without dithiothreitol. Diffraction data were recorded beyond 3.0 Å resolution using a Nicolet X-ray area detecto and CuK_α radiation from a Rigaku RU-200 rotating anode X-ray source operating at 50 kV and 60 mA. Each data set was measured from a singl crystal as a series of 5 min, 0.25° oscillation frames. A total of 440 individual frames, the equivalent of a 110° sweep, was collected and processe using the XENGEN processing software[37]. The native data set had an average sixfold redundancy, with an overall R_{sym} of 0.063 to 3.0 Å resolution The derivative data sets were measured and processed to preserve the signal that results from anomalous dispersion effects. Each derivative dat set had an average threefold redundancy, with an overall R_{sym} of 0.062 for the phenyl mercury acetate derivative and 0.076 for the lead nitrat derivative. Unless otherwise stated, all subsequent calculations were performed using the computer program package PROTEIN[38]. Initial heavy-atom positions were determined from difference Patterson maps using a vector verification technique. $P4_12_12$ was shown to be the correct space grou from difference Fourier calculations using the two derivative data sets. MIR refinement of the heavy-atom sites gave the values shown above. A contoured mini-map of electron density was computed using native structure factor amplitudes and MIR phases, and a tracing of the polypeptid chain was derived from this map. A full set of coordinates was created from C_α guide points obtained from the mini-map and the known protei sequence[36]. These coordinates were adjusted into the MIR electron density using the graphics program FRODO[39]. Coordinates were refined usin the constrained/restrained refinement program CORELS[40] from a starting R-factor of 0.485 to an R-factor of 0.370 at 3.0 Å resolution in fou steps: the fitted coordinates were regularized, the model was refined as a rigid body, individual amino acids were refined as constrained objects and side-chain dihedral angles were refined. These coordinates are the basis for the discussion of the HIV-1 protease structure presented here. We have initiated refinement using the program XPLOR[41] followed by refinement using the program PROLSQ[42]. Currently the R-factor without the inclusion of solvent is 0.25 for a model with reasonable geometry. Further rebuilding of the model and refinement are in progress.

* Normalized to 80 electrons for the highest occupancy mercury site.

† Phasing power $= \{\Sigma F_H^2/\Sigma(F_{PH^{(obs)}} - F_{PH^{(calc)}})^2\}^{1/2}$ and $R_{Cullis} = \Sigma|F_{PH^{(obs)}} - F_{PH^{(calc)}}|/\Sigma|F_{PH^{(obs)}} - F_{P^{(obs)}}|$ (for centric reflections) where F_P, F_H and F_{PH} are the structure factor amplitudes of the parent molecule, heavy atom and derivative, respectively.

involving residues Asp A25, Thr A26 and Gly A27 with Gly B27, Thr B26 and Asp B25, and, similarly, Thr A91, Gln A92 and Ile A93 with Ile B93, Gln B92 and Thr B91. There is an additional kinked antiparallel interaction involving Gln A7, Arg A8 and Pro A9 and Asn B98, Leu B97 and Thr B96, although these residues seem to be too far apart for cross-chain hydrogen bonding at this stage of the analysis. Side chains also seem to contribute to dimer stabilization. In particular, the position and orientation of both Asp A25 (and B25) and Thr A26 (and B26) are consistent with the highly conserved hydrogen-bonding scheme observed in aspartyl proteases of known structure[24–26]. Hydrophobic packing of side chains (involving, for instance, Trp A6 with Phe B99 and Ile A50 with Ile B50) may also contribute to the stabilization of the quaternary structure. Although the HIV-1 protease sequence contains two cysteine residues, at positions 67 and 95, these residues do not form disulphide linkages in the structure, either within or between monomers.

Protease structures compared

The HIV-1 protease structure was systematically compared to the structures of the three aspartyl proteases, all of microbial origin, for which coordinates are available from the Protein Data Bank[23]: rhizopuspepsin[24], penicillopepsin[25] and endothiapepsin[26]. From this analysis we concluded firstly, that large regions of the HIV-1 protease, including residues in the protease active site, have structural analogues in the microbial aspartyl proteases, and secondly, that a four-stranded β-sheet in the HIV-1 protease dimer (two strands from each monomer) differs in orientation and connectivity from the corresponding six-stranded β-sheet (three strands from each domain) observed in the microbial aspartyl proteases.

Toh and coworkers[9] noted homology between portions of the amino-acid sequences of retroviral proteases and the active-site sequences of pepsin-like aspartyl proteases. HIV-1 protease has structural homology corresponding to this sequence homology. The C_α positions of the 15 residues which were predicted to be homologous by Toh and coworkers, including the catalytic Asp–Thr–Gly triad, can be aligned with a r.m.s. deviation of 1.32 Å or less (Table 2) with corresponding residues in rhizopus-pepsin, penicillopepsin and endothiapepsin.

This structural homology between HIV-1 protease and the microbial proteases extends beyond the active sites, as shown in Table 2. When a monomer of HIV-1 protease is compared to the N-terminal domains of the microbial proteases, 47 residues can be aligned within the same r.m.s. tolerance as found for residues in the active-site loops. The region of the N-terminal domain referred to as the flap because of its apparent flexibility was specifically excluded from this alignment, however. Residues Lys 43 to Gln 58 of HIV-1 protease constitute an analogous structure. The position of the flap with respect to the body of the HIV-1 protease structure resembles most closely the position of the equivalent residues in penicillopepsin. In that structure, residues in the flap participate in interactions with symmetry-related molecules in the crystallographic unit

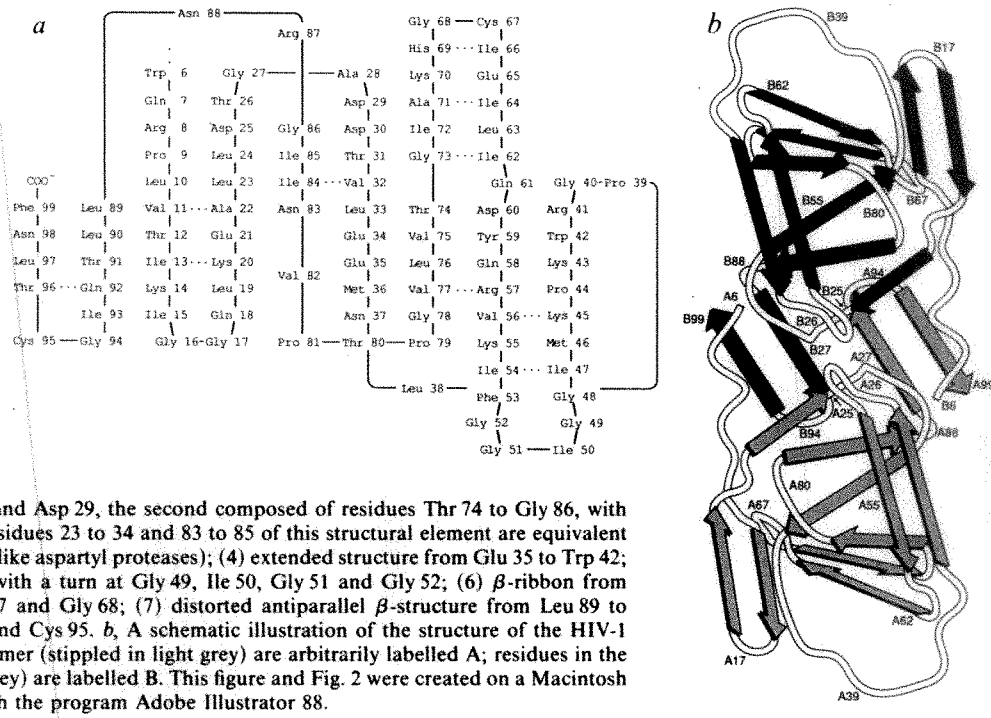

Fig. 1 *a*, A schematic illustration of the relationships between structural elements in the HIV-1 protease structure. Potential hydrogen bonds are indicated by dotted lines. Not indicated in this figure are potential hydrogen bonds between main-chain atoms of residues 65 and 67 and residues 12 and 14. As refinement proceeds, further hydrogen-bonding interactions will probably be revealed, in particular between residue Leu 23 and residues Asn 83 and Ile 85. The protein can be described as composed of seven structural elements: (1) extended structure from Trp 6 to Leu 10; (2) β-ribbon from Val 11 to Ala 22, with a turn at residues Gly 16 and Gly 17; (3) two interdigitating antiparallel structures, one composed of residues Leu 23 to Glu 34, with a turn at Gly 27, Ala 28 and Asp 29, the second composed of residues Thr 74 to Gly 86, with a turn at Pro 79, Thr 80 and Pro 81 (residues 23 to 34 and 83 to 85 of this structural element are equivalent to the Ψ-loop described for the pepsin-like aspartyl proteases); (4) extended structure from Glu 35 to Trp 42; (5) β-ribbon from Lys 43 to Gln 58, with a turn at Gly 49, Ile 50, Gly 51 and Gly 52; (6) β-ribbon from Ile 62 to Gly 73, with a turn at Cys 67 and Gly 68; (7) distorted antiparallel β-structure from Leu 89 to Phe 99, with a turn at Ile 93, Gly 94 and Cys 95. *b*, A schematic illustration of the structure of the HIV-1 protease dimer. Residues in one monomer (stippled in light grey) are arbitrarily labelled A; residues in the second monomer (stippled in darker grey) are labelled B. This figure and Fig. 2 were created on a Macintosh II with the program Adobe Illustrator 88.

cell[25]; this is also the case in the HIV-1 protease crystal structure. As shown in Fig. 3*b*, the position of the HIV-1 protease flap is more distant from the body of the structure than is the case in rhizopuspepsin. Flaps in the microbial proteases have been observed to adopt a variety of conformations and we anticipate that a similar distribution of conformations is available to HIV-1 protease.

Only 29 residues in an HIV-1 protease monomer can be aligned with residues in the C-terminal domains of microbial proteases with a tolerance of 1.45 Å or less. We do not include in this alignment the β-ribbon that contains residues 62–70. There is a corresponding structural element in C-terminal domains (residues 260–268 in rhizopuspepsin), but in HIV-1 protease this β-ribbon adopts a different orientation with respect to the body of the structure. The linkage between residues 74–77 and 83–85 (the crosspiece strand of the Ψ-loop) in HIV-1 protease contains five amino acids in a truncated square corner. This structural element resembles the corresponding feature in the C-terminal aspartyl protease domains (with six residues in a similar conformation) more than the corresponding feature in the N-terminal domains (where 13 or 14 residues adopt an extended conformation).

When the HIV-1 protease dimer is aligned with the intact microbial proteases, the r.m.s. deviation of the fit increases significantly (Table 2). This increased deviation reflects the fact that although the HIV-1 protease dimer is truly twofold sym-

Table 2 Comparison of the HIV-1 protease structure to the structures of three aspartyl proteases

he C_α coordinates of the residues in the current model of the HIV-1 protease structure were aligned with the C_α coordinates of each aspartyl ease by a least-squares rigid-body procedure. In each comparison, the r.m.s. deviation of the aligned C_α positions is given as a measure of the ity of the fit. In the comparison with intact aspartyl proteases, the HIV-1 protease dimer was treated as a rigid body, as were the pepsin-like rtyl proteases. The indicated residues in each monomer (denoted arbitrarily as A and B) of the rigid dimer were simultaneously aligned with ues in the N- and C-terminal aspartyl protease domains.

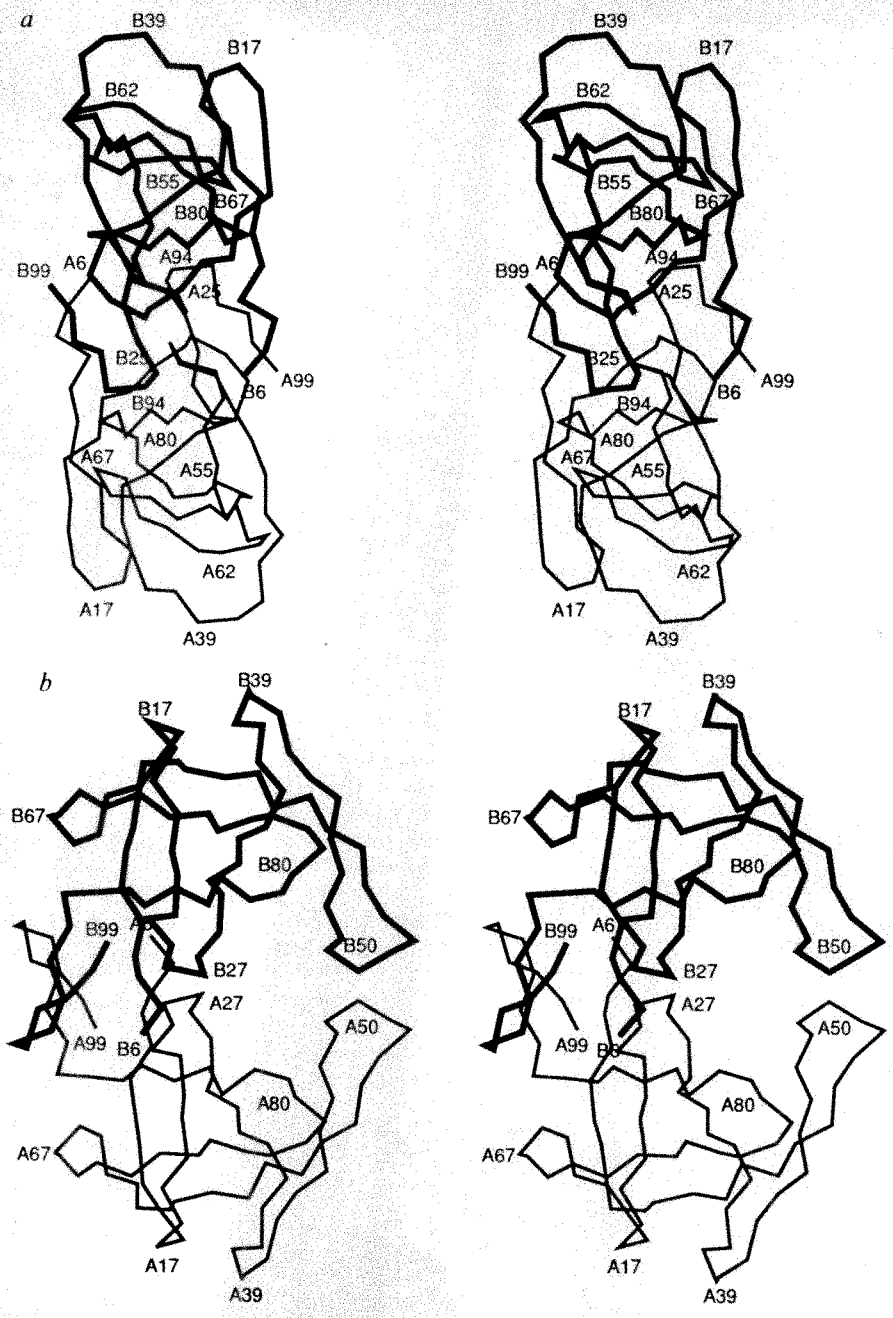

Fig. 2 A C_α representation of the structure of residues 6–99 of the HIV-1 protease dimer, with one monomer (arbitrarily labelled A) drawn in thin lines and the second monomer (arbitrarily labelled B) drawn in thick lines. *a*, The view is along the twofold symmetry axis of the protease dimer. *b*, The view represents a rotation of 90° about the vertical axis of the view of (*a*).

metric, the twofold axis that relates the N- and C-terminal domains of microbial aspartyl proteases is only approximate. (The relationship in penicillopepsin has been described[20] as a rotation of 174.6° and a translation of 1.0 Å.) As Fig. 3 illustrates, the most striking difference between the superimposed structures occurs in the orientation and connectivity of the β-sheet formed by residues at the N and C terminals (note that these regions are not included in the rigid body superposition).

The topological homology between an HIV-1 protease monomer and the N- and C- terminal domains of the microbial aspartyl proteases involves the same residues that are homologous between the two domains. There are 85 pairs of residues in the N- and C-terminal domains of rhizopuspepsin that can be aligned with an r.m.s. deviation for the C_α positions of 2.3 Å[24]. If we exclude residues in the six-stranded sheet from this list, 57 pairs of residues remain. All 47 of the residues used in the N-terminal alignment of Table 2 are in this set of domain-equivalent residues, as are all 29 of the residues used in the C-terminal alignment.

We have also compared the structure of the HIV-1 protease reported here to the model for the structure proposed by Pearl and Taylor[27]. To the extent that the X-ray structure is simila to the microbial aspartyl protease structures, from which thei model was derived, it would seem that their predictions ar reasonable. There are significant differences between the stru ture and their model, however. These differences include th topology of the N- and C-terminal regions and the predicti of helical structure near the C terminal (compare their Fig. with our Fig. 1*a*).

Release from the *gag-pol* product

The HIV-1 protease monomer is synthesized as part of a *gag* fusion product which results from an infrequent ribosomal fra shift from the *gag* to the *pol* reading frames[28]. Evidence sugg that the protease can autocatalytically release itself from gag-pol polyprotein[7,16,29]. The structure of the HIV-1 prot dimer presented here suggests a mechanism by w autoproteolysis at its N-terminal connections to the polypr may occur. From the observed position of residue Trp 6 i structure and the implied flexibility of the five N-ter residues (see above), it seems that the scissile Phe–Pro b could be positioned in the protease active site for cleavage

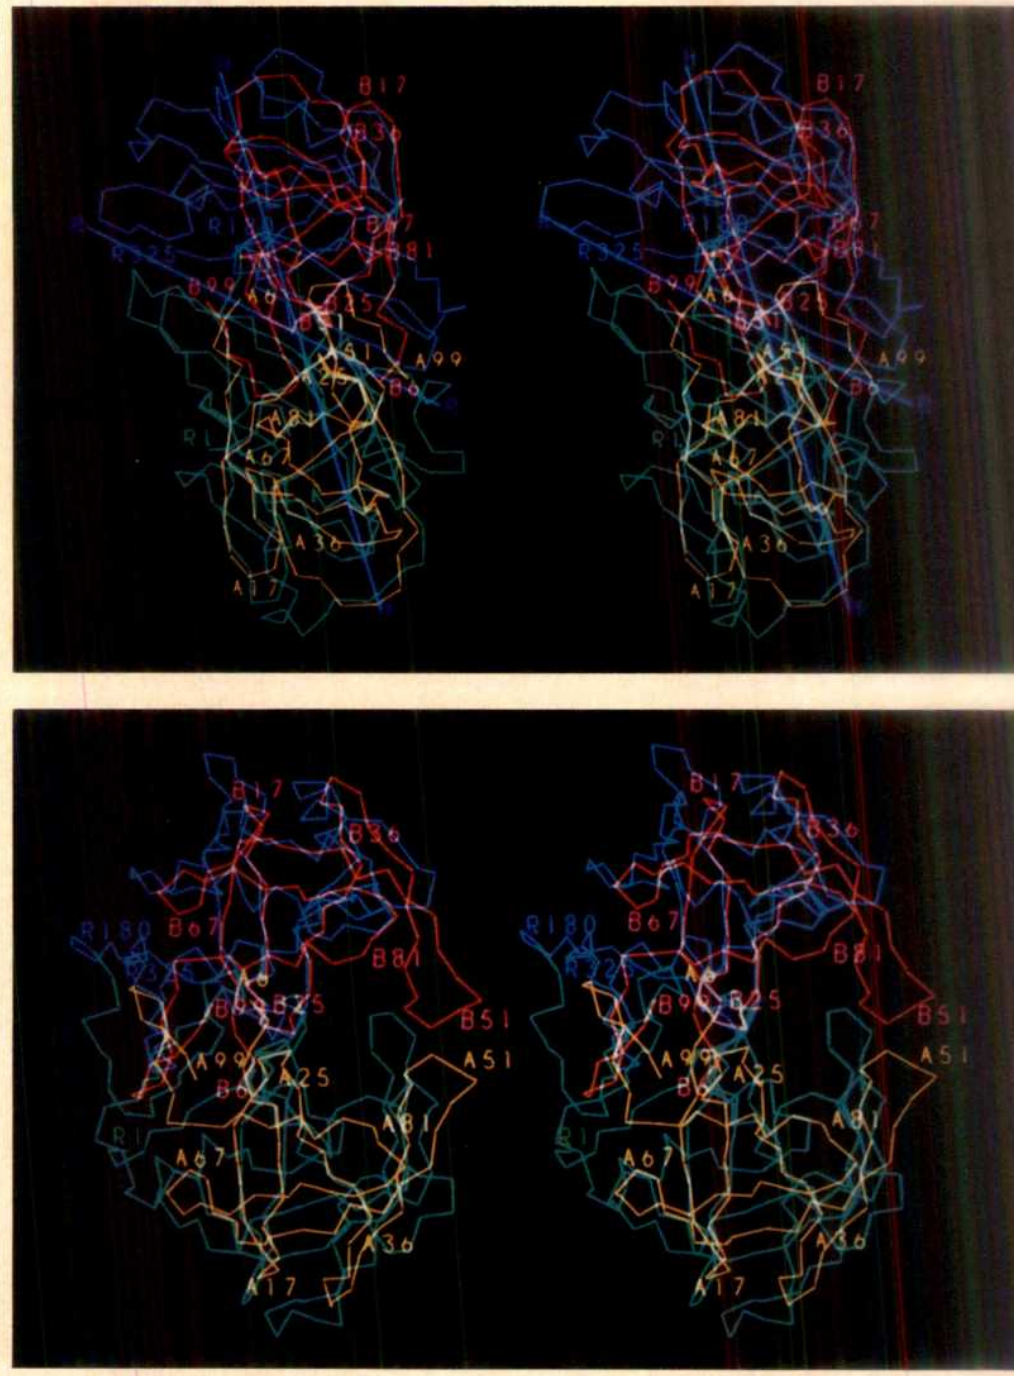

Fig. 3 A comparison of the structure of the HIV-1 protease dimer with rhizopuspepsin. 47 residues in monomer A of HIV-1 protease (gold) have been aligned with the corresponding residues in the N-terminal domain of rhizopuspepsin (green); 29 residues in monomer B of the protease (red) have been aligned with residues in the C-terminal domain (blue). The views in (*a*) and (*b*) are as in Fig. 2. The lines in Fig. 3*a* emphasize the approximate 50° difference in orientation of the multistranded β-sheets in the two structures (R indicates rhizopuspepsin, H indicates HIV-1 protease). The connectivity of the sheets is also different. The N-terminal domain of rhizopuspepsin contributes strands to the half of the sheet that lies to the lower left of the approximate dimer axis when viewed down that axis; the C-terminal domain contributes strands that lie to the upper right. In contrast, monomer A of the HIV-1 protease dimer, which has been aligned with the N-terminal domain of rhizopuspepsin, contributes strands to the half of the sheet that lies to the right of the dimer axis; monomer B, aligned with the C-terminal domain, contributes strands that lie to the left.

pol-encoded residues between the frameshift site and the protease have no known structural or catalytic function. They may, in fact, serve as a flexible linker to facilitate the N-terminal cleavage process. All of this implies that the N-terminal clips needed to release the protease, could be accomplished intramolecularly.

Analogous C-terminal cleavages are more difficult to envisage because this sort of cleavage would require the unravelling of a substantial portion of the structure to position in the active site the bond connecting the C-terminal Phe 99 of HIV-1 protease to the directly adjacent N-terminal Pro 1 residue of the much larger reverse transcriptase. We suggest that the cleavage at the C terminal can be carried out intermolecularly by a second HIV-1 protease dimer.

Control of HIV-1 assembly

The process of viral assembly takes place at the plasma membrane of the host cell. Both the *gag* and *gag-pol* products migrate there and become anchored to the cytoplasmic side by a covalent, N-terminal-linked myristic acid[30,31]. Electron micrographs of the virus assembly process suggest that the polyproteins aggregate, the membrane bulges outward and nascent viral particles bud from the plasma membrane[32]. The generation of mature viral enzymes and structural proteins from these polyproteins does not seem to occur until after the virion has budded[14,32]. The conversion of the immature virion to the morphologically distinct, infectious entity requires the participation of HIV-1 protease[14].

By analogy with the pepsin-like aspartyl proteases, only a dimer of HIV-1 protease would be catalytically competent. The requirement that dimers form before proteolysis can occur indicates a possible role for HIV-1 protease in the control of virus maturation. If an active protease dimer were to form before the nascent virus had budded from the host cell, autoproteolysis at the N terminal could occur. The symmetric nature of the protease active site allows this clip to occur for each of the two anchoring

gag-pol products, effectively solubilizing the protein, and permitting the protease (and the C-terminal linked enzymes) to diffuse away from the plane of the membrane. This diffusion would prevent premature initiation of virus maturation. Once the nascent virus particles have budded from the cell membrane, however, autoproteolytically liberated protease could diffuse only within the isolated environment of the virus particle. A cascade of proteolytic events, liberating gag and pol structural proteins and enzymes (including additional copies of the protease itself) would be initiated. Such a proteolytic cascade in the confined space of the viral envelope would generate a burst of mature viral proteins and allow the rapid self-assembly necessary to achieve full infectivity. If this mechanism is correct, it implies that retroviral proteases, including HIV-1 protease, may be more than 'fossil' examples of an ancestral dimeric aspartyl protease[27].

Conclusions

Self-assembly of two identical monomers into a symmetric structure represents an elegant method for creating an active enzyme while encoding a minimal amount of genetic information. The proposed mechanisms of action of the aspartyl proteases[33-35] require the exact symmetry observed in the HIV-1 protease dimer to be broken at some point during the binding and catalysis of intrinsically asymmetric peptidyl substrates. Because of the symmetric nature of the active site, however, the initial orientation of substrate can be either right-to-left or left-to-right in the view of Fig. 2*a*.

HIV-1 protease is the first of the HIV-1 proteins to have its structure determined. The close resemblance between its active sites and those of the pepsin-like aspartyl proteases, where many inhibitor complexes have been investigated crystallographically suggests that it may be possible to carry over the insights derived from these studies to the design of specific HIV-1 protease inhibitors, for use as safe and effective agents in the control of AIDS.

We thank Dr John Mertz of Cray Research Inc., Minnesota, for the refinement calculations using program XPLOR.

Mitochondrial heat-shock protein hsp60 is essential for assembly of proteins imported into yeast mitochondria

A nuclear encoded mitochondrial heat-shock protein hsp60 is required for the assembly into oligomeric complexes of proteins imported into the mitochondrial matrix. hsp60 is a member of the 'chaperonin' class of protein factors, which include the Escherichia coli *groEL protein and the Rubisco subunit-binding protein of chloroplasts.*

MOST mitochondrial proteins are encoded by nuclear genes, synthesized in the cytosol as precursor proteins and subsequently imported into the organelles (for reviews see refs 1-3). Newly synthesized precursors have to assume an 'unfolded' conformation to be translocated across the mitochondrial membranes[4-6]. Cytosolic heat-shock proteins of the hsp70 family plus an additional activity which might be an ATP-dependent 'unfoldase' may have a role in maintaining this translocation-competen conformation[7-12]. Transport across the mitochondrial membranes occurs at translocation contact sites between outer an inner membranes[13,14]. Proteolytic cleavage of presequences performed during or after translocation by the mitochondri

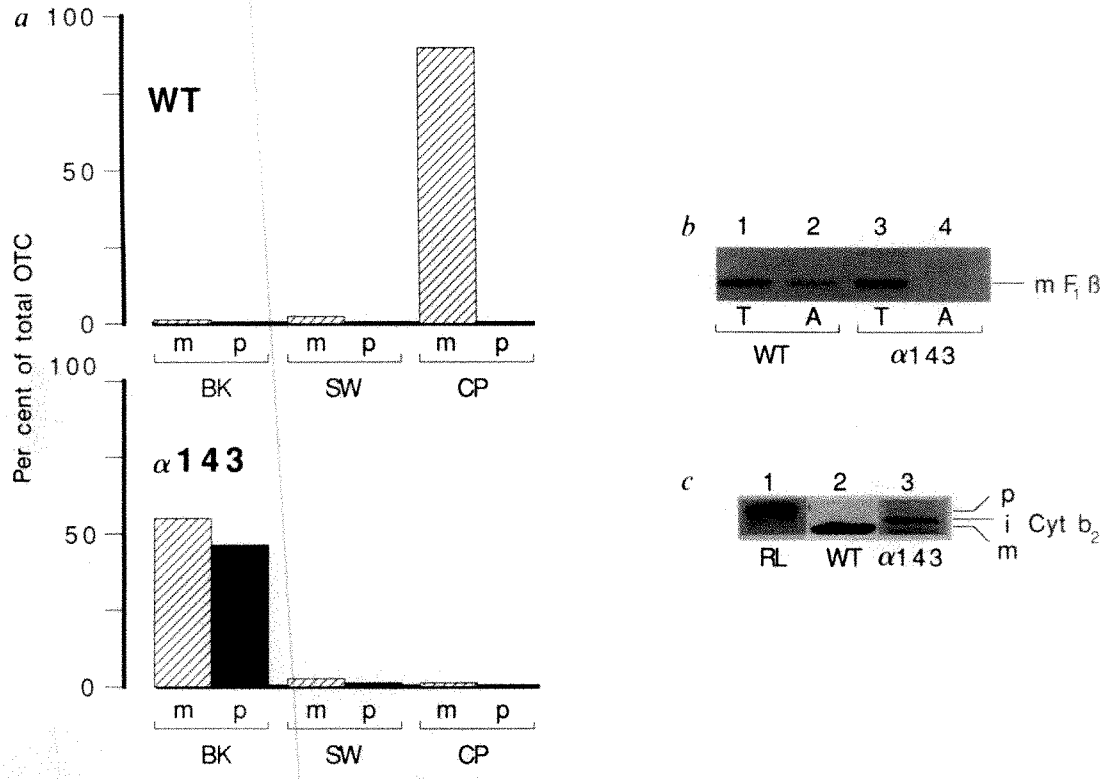

Fig. 1 Analysis of mitochondrial proteins in α143 cells. *a*, Defective assembly of OTC. Amounts of OTC contained in breakthrough (BK), salt wash (SW), and carbamyl phosphate elution (CP) of PALO columns are expressed as percentages of total OTC in cell extracts. p, Precursor; m, mature-sized OTC. *b*, Defective assembly of $F_1\beta$-ATPase. Lanes 1 and 3, immunoprecipitation of $F_1\beta$-ATPase from total amount (T) of mitochondrial fractions equivalent to the amounts analysed by chloroform extraction; lanes 2 and 4, immunoprecipitation of aqueous phase (A) of chloroform extracts. *c*, Defective maturation of cytochrome b_2. Lane 1, precursor of cytochrome b_2 immunoprecipitated after synthesis in a reticulocyte lysate (RL) directed by mRNA transcribed from the cytochrome b_2 gene cloned into pGEM3 (refs 20, 41); lane 2, mature-sized cytochrome b_2 immunoprecipitated from [^{35}S]methionine-labelled wild-type cells (WT); lane 3, intermediate-sized cytochrome b_2 immunoprecipitated from α143 cells.

Methods. *a*, Yeast cells were grown at 23 °C in YPEG medium until $A_{600} = 1$. Five A_{600} units of cells were resuspended in 1 ml fresh YPEG medium. After 30 min at 37 °C, galactose was added and incubation carried on for 2 h. Spheroplasts were then prepared[18], extracted with 20 mM Hepes, *p*H 7.4/1% Lubrol, and analysed on PALO columns[30]. Eluted fractions were precipitated with trichloroacetic acid (TCA) and analysed by SDS gel electrophoresis[42] and immunoblotting using anti-OTC antiserum and ^{125}I-protein A. Fluorographs were quantified by densitometry[20]. *b*, For *in vivo* labelling cells were grown at 23 °C in minimal galactose medium to an OD_{600} of 0.5. Four A_{600} units of cells were resuspended in 2 ml fresh minimal galactose medium and shifted to 37 °C. After 2 h, 400 μCi [^{35}S]methionine was added and incubation carried on for an additional 30 min. The reaction was stopped by adding NaN_3 to 10 mM and 25 OD_{600} units of nonlabelled cells as carrier. Spheroplasts were prepared and a crude mitochondrial fraction was isolated[18,20]. 5×10^6 c.p.m. of wild-type and 10×10^6 c.p.m. of α143 mitochondrial fractions were adjusted to 100 μl with 0.6 M sorbitol buffer and extracted with 50 μl chloroform[31] by vortexing for 1 min. Approximately 7.5% of total counts in wild-type and 4.5% in α143 were recovered in the aqueous phase. The aqueous phases were boiled in SDS-containing buffer and diluted 20-fold with TNTE (20 mM Tris *p*H 7.8, 150 mM NaCl, 1% Triton X-100 and 5 mM EDTA). $F_1\beta$-ATPase was immunoprecipitated[18] and the precipitates were analysed by SDS gel electrophoresis and fluorography.

processing peptidase in the matrix[15-18]. Some precursors of intermembrane-space proteins are re-translocated from the matrix back across the inner membrane by a mechanism similar to bacterial protein export[19,20]. Finally, all imported proteins have to (re)fold and in most cases assemble into supramolecular complexes to become functionally active. Very little is known about these last stages of the import pathway.

The complex processes involved in folding and assembly of proteins imported into mitochondria might not occur spontaneously but rather might require one or more gene products. To detect such components, a bank of temperature-sensitive lethal yeast mutants was screened for a phenotype which results from deficiency in assembly of mitochondrial proteins. We describe here a nuclear mutation, *mif4*, in which subunits of mitochondrial enzymes such as subunit β of F_1-ATPase are completely translocated into the organelles, are processed to their mature-sized forms but fail to assemble into their respective supramolecular complexes. Proteins with complex presequences like cytochrome b_2 and the Rieske Fe/S protein of complex III are also affected. These proteins normally pass through the matrix on their way to the intermembrane space and they probably require interaction with protein factors during their assembly process. In the *mif4* mutant they accumulate as incompletely processed import intermediates.

The *Mif4* gene codes for a constitutively expressed stress protein, hsp60, which is structurally related to the α-component of the chloroplast Rubisco subunit-binding protein and the *E. coli* heat-shock protein groEL[21,22]. These two proteins have been named 'chaperonins'[21,23] because they were proposed to chaperone oligomeric protein assembly, such as bacteriophage head assembly in *E. coli*[24,25], and Rubisco assembly in chloroplasts[26,27]. Yeast hsp60 is localized in the mitochondrial matrix as a high molecular weight complex which has a distinct sedimentation behaviour on sucrose gradients. We suggest that interaction of imported proteins with this hsp60 scaffold is an essential step in conferring a conformation to imported precursor proteins which renders them competent for assembly with other subunits or for further intramitochondrial sorting.

Mutants

Mutants lacking enzymatic activity of imported mitochondrial proteins. Recently, we described a procedure for the selection of so-called *mif*-mutants (*mif*, for mitochondrial import functions), conditional yeast mutants affecting the mitochondrial

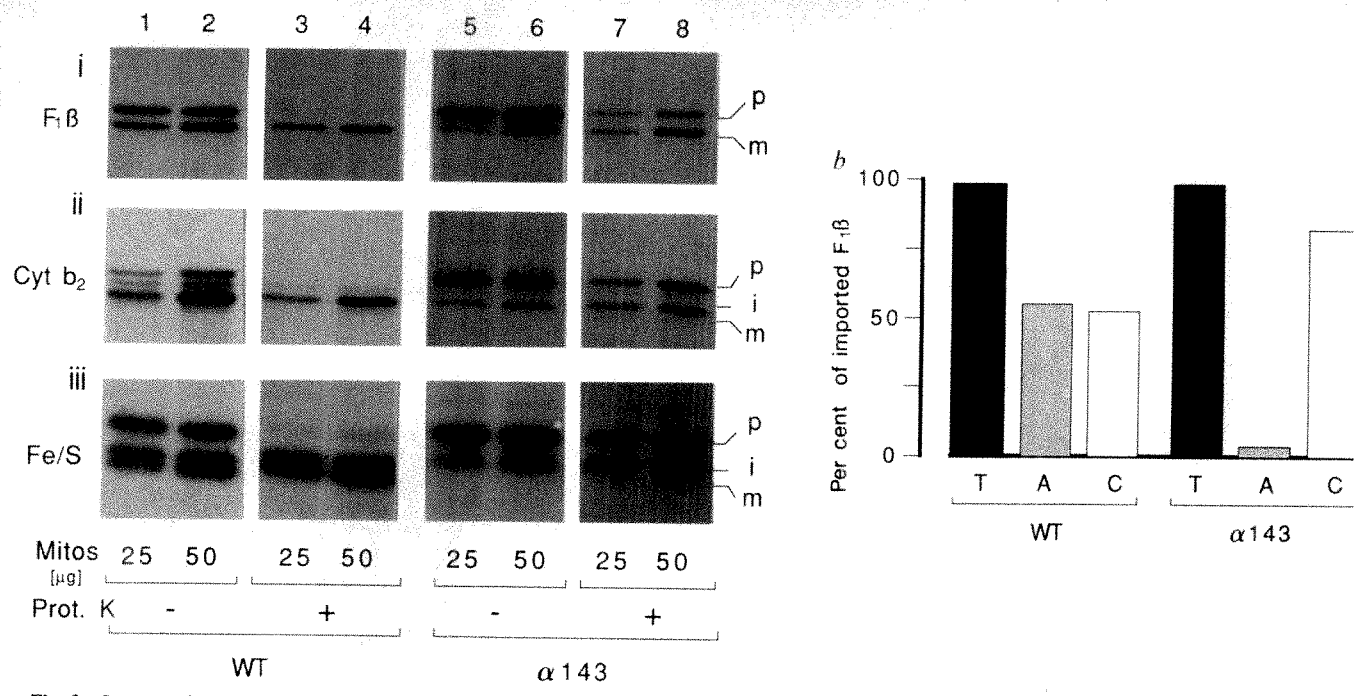

Fig. 2 Import of precursor proteins into isolated α143 mitochondria. *a*, Import of precursors of $F_1\beta$ (i), cytochrome b_2 (ii) and Rieske Fe/S protein (iii) into isolated mitochondria of wild-type (WT) and α143 mutant. Prot. K, proteinase K; p, precursor; i, intermediate-sized form; m, mature-sized form. *b*, Assembly of $F_1\beta$ imported *in vitro* into F_1-ATPase complex. Amounts of mature-sized $F_1\beta$ contained in chloroform (C) and aqueous phases (A) are given as percentages of total $F_1\beta$ contained in 50 μg of mitochondria (T) subjected to chloroform extraction. **Methods.** Wild-type and α143 yeast were grown overnight in YPEG at 23 °C. Then the temperature was shifted to 37 °C for 1 h. Spheroplasts were prepared and mitochondria were isolated[20]. Precursor proteins were synthesized in reticulocyte lysates in the presence of [^{35}S]methionine by coupled transcription/translation of the cDNAs ($F_1\beta$, Rieske Fe/S protein) or the genomic DNA (cytochrome b_2) cloned into pGEM3 using SP6 polymerase[20,41,43]. *a*, For import *in vitro* mitochondria were incubated for 30 min at 25 °C in reticulocyte lysates diluted 5-fold with BSA buffer (3% bovine serum albumin, 80 mM KCl, 10 mM MOPS (3-[*N*-morpholino]propanesulphonic acid) *p*H 7.2) containing 1 mM NADH and 2 mM ATP. The final concentration of mitochondria in the import reactions was 25 μg (lanes 1,3,5,7) and 50 μg (lanes 2,4,6,8) in a reaction volume of 100 μl. The reactions were placed on ice and one half of each sample was treated with proteinase K (Prot. K) (20 μg ml^{-1}, final concentration) for 30 min at 0 °C (lanes 3,4 and 7,8) (ref. 20). The other halves remained on ice for the same period. Finally, mitochondria were re-isolated, solubilized in SDS-containing buffer and analysed by SDS polyacrylamide gel electrophoresis and fluorography[20,42]. *b*, Mitochondria of wild-type and α143 cells (50 μg each) which had imported the radiolabelled precursor of $F_1\beta$ from a reticulocyte lysate were treated with protease as described above and subjected to chloroform extraction (see legend to Fig. 1*b*)[31]. Chloroform phases were dried under vacuum and aqueous phases precipitated with trichloroacetic acid (TCA) were analysed by SDS electrophoresis and fluorography. Fluorographs were quantified by densitometry.

protein import machinery[18]. Temperature-sensitive (ts) lethal mutants were derived by EMS-mutagenesis from a yeast strain (Ga1OTCRP/11) that is defective at the (cytosolic) ornithine transcarbamylase (OTC) locus (*arg3*) but contains the sequence coding for the human mitochondrial OTC (joined to an inducible yeast Ga11 promoter) integrated in its *URA3* locus. Upon expression in wild-type yeast cells, human OTC was imported into the mitochondrial matrix, processed and assembled to the enzymatically active trimer[28]. Mutants defective in expression of OTC activity at the non-permissive temperature were analysed. This led to the identification of mutants which accumulated at non-permissive temperature the precursor of human OTC but also the precursors of endogenous yeast mitochondrial proteins. This class of mutants included the complementation groups *mif1* and *mif2* which affect the processing enhancing protein (PEP) and the mitochondrial processing peptidase (MPP), respectively, components required for proteolytic processing of precursor proteins[16-18,29].

In a second class of ts-lethal mutants mature-sized OTC subunits accumulated. One mutant, α143, was further characterized. At non-permissive temperature the cells produced mature-sized OTC subunits and OTC precursor. But, no OTC activity was detectable. When examined at the permissive temperature, α143 cells behaved like wild-type. A single ts mutation which did not reside in the *OTC* gene itself was responsible for this phenotype.

Mutation affects assembly of several mitochondrial proteins. To test whether OTC subunits in the α143 cells had assembled into the homotrimeric enzyme an assay was carried out using the OTC substrate analogue δ-*N*-(phosphono-acetyl)-L-ornithine (PALO)[30] (Fig. 1*a*). Total extracts were prepared from cells grown for 2 h at 37 °C in galactose medium and were applied to columns containing PALO linked to epoxy-Sepharose. Extracts of wild-type cells contained only mature-sized OTC. Practically none of this was detected in the flow-through and wash fraction of the column, but OTC could be completely eluted with the OTC substrate carbamyl phosphate (Fig. 1*a*, upper panel). In contrast, with extracts of α143 cells both precursor and mature-sized OTC subunits were observed. They were quantitatively recovered in the flow-through (Fig. 1*a*, lower panel). The total contents of OTC polypeptides in wild-type and α143 cells were very similar. At non-permissive temperature mature-sized human OTC subunits were produced in α143 cells but failed to assemble into the homotrimeric, catalytically active, enzyme.

To find out whether the α143 mutation affects the assembly of an endogenous yeast mitochondrial protein we investigated the assembly of the β-subunit of F_1-ATPase ($F_1\beta$) into the F_1-ATPase complex (Fig. 1*b*). Our assay took advantage of the previous observation that upon treatment of a mitochondrial suspension with chloroform, assembled F_1-ATPase complex partitions into the aqueous phase, whereas non-assembled subunits of the ATPase partition into the organic phase[31]. Cultures of α143 and of wild-type cells were grown at 23 °C, then shifted to 37 °C and radio-labelled with [^{35}S]methionine. Mitochondria were isolated and were subjected to chloroform extraction

About 40–50% of total mature-sized $F_1\beta$ of wild-type mitochondria was recovered in the aqueous phase of the chloroform extraction, reflecting assembly of mature subunits into the ATPase complex (Fig. 1*b*, lane 2 versus 1). In contrast, virtually no mature $F_1\beta$ subunit of α143 mitochondria was detectable in the aqueous phase (Fig. 1*b*, lane 4 versus 3). We conclude that mature $F_1\beta$ subunits produced in the α143 mutant at the non-permissive temperature failed to assemble into the F_1-ATPase complex.

This observed deficiency in assembly of two matrix-located proteins in the α143 cells led us to ask whether the import pathway of proteins passing through the matrix compartment *en route* to the intermembrane space was also affected. One example of such a protein is cytochrome b_2. The precursor containing a bipartite targeting sequence is first completely translocated into the matrix and cleaved by the mitochondrial processing peptidase to an intermediate-sized form. This intermediate is directed back across the inner membrane by the second part of the presequence and cleaved to the mature-sized form at the outer surface of the inner membrane[20]. When extracts of α143 cells grown at non-permissive temperature were analysed, essentially only the intermediate-sized form was detected (Fig. 1*c*). These observations could be explained either by a defect in the translocation of the precursor into the matrix space or by a conformational alteration conferred to the precursor within the matrix compartment.

Block is after membrane translocation. To decide which step of the import pathway was affected by the α143 mutation the same proteins whose assembly had been examined in intact cells were synthesized as radiolabelled precursors in a reticulocyte lysate and added to isolated mitochondria. Upon incubation with wild-type mitochondria prepared from cells grown at 37 °C, precursor of $F_1\beta$ was converted to its mature-sized form which was protected against externally-added protease (Fig. 2*a*, panel *i*). When import into mitochondria from α143 cells grown for 1 h at 37 °C was examined, again the mature-sized subunit (and the precursor) was observed to be protected from digestion by added protease. This excluded a defect in translocation of precursor proteins. To determine the state of assembly of the imported mature $F_1\beta$ subunits, the organelles were re-isolated from the import reactions and subjected to chloroform extraction (Fig. 2*b*). With wild-type mitochondria, more than 50% of the imported mature-sized $F_1\beta$ partitioned into the aqueous phase. In contrast, after extraction of α143 mitochondria virtually no mature-sized $F_1\beta$ was detected in the aqueous phase, indicating that the imported subunit had failed to assemble.

Precursor of cytochrome b_2 was also imported by α143 mitochondria into a protease-protected position (Fig. 2*a*, panel ii). In contrast to intact cells, isolated mitochondria from α143 cells accumulated the precursor rather than the intermediate-sized form. This might reflect kinetic differences between import reactions *in vivo* and *in vitro*. The activity of the mitochondrial processing enzyme measured in detergent extracts of α143 mitochondria was not reduced compared to extracts prepared from wild-type organelles (data not shown).

In a similar way, the mutation affected assembly of the Rieske Fe/S protein of complex III. After translocation into the matrix, this protein, like cytochrome b_2, reaches a location at the outer surface of the inner membrane by re-translocation across the inner membrane. Fe/S precursor is proteolytically processed in two steps. In contrast to cytochrome b_2, however, the second processing event takes place in the matrix before re-transport to the intermembrane space. The second processing event which removes the carboxy-terminal eight residues of the presequence is probably dependent on a conformational change of the protein induced by the formation of the iron-sulphur cluster[19]. Isolated α143 mitochondria imported the precursor of Fe/S protein into a protease protected position but were unable to process it to the mature-sized form (Fig. 2*a*, panel iii). Precursor and intermediate-sized Fe/S protein accumulated. In view of the results

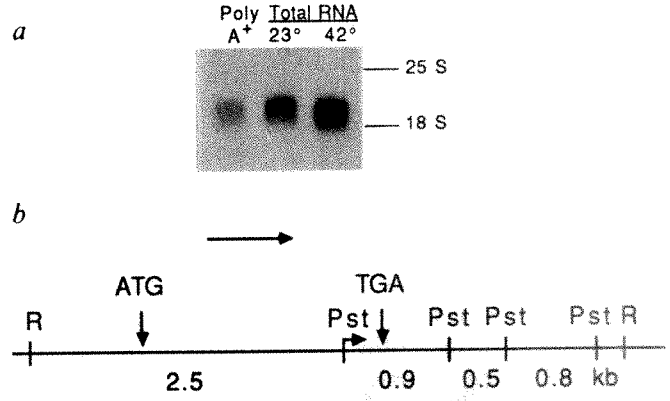

Fig. 3 Analysis of the rescuing plasmid p8. *a*, The insert of plasmid p8 recognizes a heat-inducible mRNA. 25 S and 18 S indicate migration positions of the respective yeast ribosomal RNAs. *b*, The restriction map of the p8 plasmid insert is identical to that of a λ-phage bearing the *Hsp60* gene. A 5 kilobase (kb) EcoRI fragment derived from plasmid p8 was analysed by *Pst*I digestion, and the fragment sizes compared with those of λ-Hsp60 (ref. 32). This latter clone had been isolated from a λgt11 yeast genomic library using an antiserum directed against the 58K mitochondrial heat-shock protein of *Tetrahymena thermophila*[33]. The fragment order is that indicated from sequence analysis of λ-Hsp60. A 0.9-kb *Pst*I fragment derived from p8 was sequenced in the region indicated by the horizontal arrow, and found to be identical to the one reported for the *Hsp60* gene[32]. The translational start and stop codons and direction of translation (long horizontal arrow) of *Hsp60* as determined from the clone are shown.
Methods. Wild-type cells were grown in YPEG medium at 23 °C to mid-log phase. Half of the culture was further incubated for 1 h at 23 °C and the other half at 42 °C. Total RNA was prepared[44]. Poly(A)$^+$ RNA was prepared from wild-type cells grown at 23 °C (ref. 45). RNA (10 μg of total, 2 μg of poly(A)$^+$) was electrophoresed in a 1% agarose gel, transferred to nitrocellulose[46], and hybridized with a nick-translated 0.9-kb *Pst*I fragment derived from the p8 insert (shown in Fig. 3*b*).

with import of the other mitochondrial proteins analysed, it is unlikely that the α143 mutation affects a mitochondrial component responsible for iron-sulphur cluster formation or the second proteolytic processing of Fe/S protein.

Altogether, the data suggest that α143 mitochondria are defective in a component which has a role in interacting with imported precursors, conferring conformational competence required for further steps of the import pathway. Such steps may include proteolytic processing, perhaps other covalent modifications (such as iron-sulphur cluster formation), assembly into supramolecular complexes, and further membrane translocation events.

Mutation is in the gene for hsp60. The α143 strain was mated at 23 °C with a wild-type strain of the opposite mating type and the diploids were shifted to 37 °C. They exhibited a wild-type phenotype indicating that the mutation in α143 is recessive. The α143 strain was next crossed with other recessive lethal mutant strains which are defective in mitochondrial import, belonging to the complementation groups of *mif1*, *mif2*, and *mif3* (ref. 18). Diploid cells from all three crosses grew normally at 37 °C, indicating that α143 belongs to a different complementation group, which we designated *mif4*.

To isolate a wild-type copy of the *Mif4* gene, the haploid α143 strain was transformed with a library containing yeast genomic DNA fragments inserted into a centromere-bearing plasmid. DNA was prepared from colony-purified transformants growing at 37 °C and used to transform *E. coli* to ampicillin-resistance[18]. Plasmids were isolated and found to share several restriction fragments of inserted yeast DNA.

To test whether the rescuing plasmids might encode a heat-shock protein, an insert from one plasmid (p8) was used to probe blots containing RNA prepared from wild-type yeast

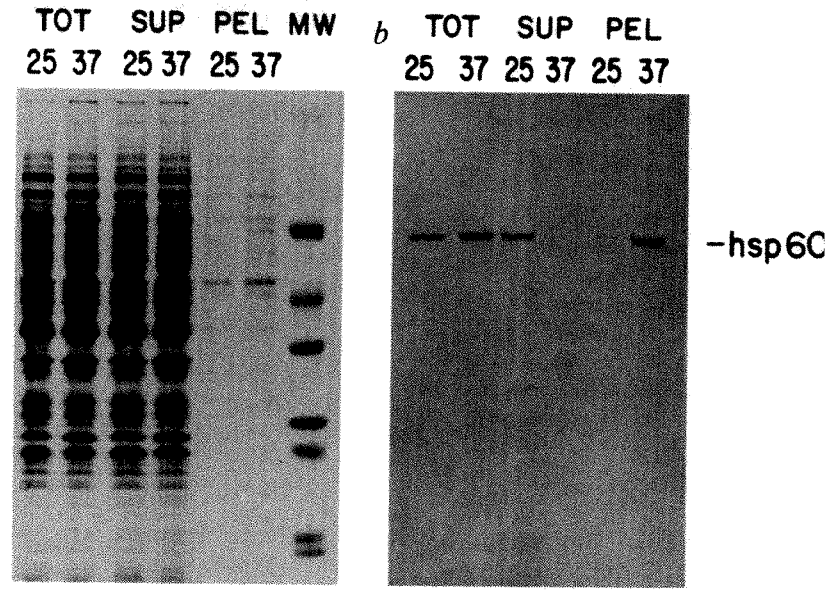

Fig. 4 Altered sedimentation of hsp60 protein in α143 cells. Fractionation by centrifugation of detergent extracts of α143 cells grown at 25 °C (25) or exposed to 37 °C for 2 h (37). *a*, Coomassie stained total proteins. *b*, Hsp60 as shown by immunoblotting using anti-hsp58 antiserum[33]. TOT, total extracts; SUP, supernatants; PEL; pellets.
Methods. An overnight culture of α143 cells grown at 25 °C was divided into halves. One half remained at 25 °C, whereas the other was transferred to 37 °C for 2 h. Then the cells were washed, broken by vortexing with glass beads and solubilized with 1% Triton X-100 and 0.5% deoxycholate[22,32]. After a clarifying centrifugation at 1,000*g* for 5 min, the extracts were centrifuged at 15,000*g* for 15 min. Equivalent amounts of total extracts, 15,000*g* supernatants and pellets were analysed on 12.5% SDS polyacrylamide gels.

maintained at 23 °C or exposed to 42 °C for 1 h. The insert identified a poly(A)$^+$ mRNA of ~1,800 nucleotides whose content in a preparation of total RNA was increased 2- to 3-fold by incubation of cells at 42 °C (Fig. 3*a*). It seemed possible that the *Mif4* gene encodes the heat shock protein (relative molecular mass, M_r, 60,000 (60K)) recently identified in mitochondria of yeast[22]. The restriction map of the insert p8 was compared with the restriction map of a λgt11 clone containing the *Hsp60* gene[32]. The maps of the two cloned yeast segments overlapped precisely (Fig. 3*b*). A region of p8 extending over 150 base pairs (bp) was subjected to DNA sequence analysis. The sequence was identical with that from the corresponding region in *Hsp60*, which lies within the protein-coding region[32] (data not shown).

To confirm that the *Hsp60* gene is the one affected by the *mif4* mutation a wild-type copy of *Hsp60* was integrated into the *Hsp60* locus in α143 cells and mating was carried out with a wild-type strain. Following sporulation, tetrad analysis revealed that all spores were viable at 37 °C. Thus, the *mif4* mutation responsible for the observed defect of assembly of mitochondrial proteins, is in the structural gene for hsp60.

Mutant contains an altered hsp60 complex. The *Hsp60* gene is essential for the growth of yeast and encodes a precursor (~61K) that is targeted to the mitochondrial matrix, probably by an amino-terminal cleavable targeting sequence[32]. The mature protein bears a distinct resemblance to the 58K product of the *groEL* gene of *E. coli*, a product required for bacteriophage head assembly and essential for cell viability[21,24]. Like groEL, hsp60 resides in a macromolecular complex[22]. Following extraction in its native state it sediments in sucrose gradients to a size position corresponding to a multimer of 12–16 identical subunits. In electron microscopic analysis of fractions containing the protein, two 7-fold symmetric 'doughnuts' are observed, placed one on top of the other[22].

If the macromolecular complex containing hsp60 is the functionally active form, then alteration of the hsp60 component by mutation might affect the integrity of the complex. Total extracts were prepared from α143 cells that had been either maintained at permissive temperature or shifted to 37 °C. Supernatants obtained by centrifugation at 15,000*g* were fractionated on sucrose gradients (data not shown). Hsp60 extracted from cells grown at 25 °C migrated as an approximately 20S particle. Analysis of extracts from α143 cells incubated at 37 °C for 30 min revealed a much smaller portion of the total hsp60 protein at this position of the gradient. Instead, most of the product was found in the pellet of the 15,000*g* centrifugation. When an extract from α143 cells which had been kept at 37 °C for 2 h was analysed, the total amount of hsp60 present increased about 2-fold but all of it was detected in the 15,000*g* pellet fraction (Fig. 4). In a control experiment with wild-type yeast, all of the hsp60 remained in the supernatant of the 15,000*g* centrifugation and migrated as 20S particles, irrespective of whether the cells were exposed to 37 °C. It is not known why hsp60 from α143 cells exposed to 37 °C sediments into a 15,000*g* pellet. The hsp60 complex may have become denatured and thus precipitated. Alternatively the complex might somehow have become associated with the mitochondrial membranes, although the presence of detergents during extraction makes this unlikely. Whatever the precise alteration, we conclude that the physical properties of the protein complex containing hsp60 are affected by the mutation present in the α143 strain.

Conclusions

Polypeptides entering the mitochondrial matrix space from the cytosol require a matrix protein, the *Mif4* gene product hsp60, for assembly and/or for further processing and sorting events. Consistent with this essential function, hsp60 is constitutively expressed. Its classification as a stress protein refers to the 2- to 3-fold induction observed in response to incubation of yeast cells at 42 °C. This response may reflect a cellular mechanism for maintaining functional conformation of mitochondrial proteins during and following heat stress.

The mechanism by which hsp60 affects the conformation of polypeptides entering the matrix space is undefined so far. The presence, however, of hsp60 in a macromolecular complex whose sedimentation properties are affected by mutation, could suggest that a 'machinery' is involved. Whether hsp60 is the only component of such a machinery is unknown. If the resemblance of hsp60 to the *E. coli* groEL protein[21] is any indicator, however, then other proteins are likely to play a role in addition, as in *E. coli* at least one other protein, groES, is required for assembly of phage heads[34,35]. Recently, the association of groEL with newly-synthesized, unfolded proteins has been demonstrated[36], suggesting that groEL might indeed have a function equivalent to its mitochondrial counterpart. Considering the double doughnut structure in which hsp60 apparently resides and the similar 14-subunit scaffold structure of groEL, we favour the idea that hsp60 may play mainly a structural role, acting as a 'workbench' on which folding and oligomerization is carried out by other proteins with catalytic activity. Putative catalytic components might reside either within the complex or within the soluble matrix. Included among such components could be another stress protein recently found to reside in the matrix space, belonging to the *Hsp70* gene family[37].

Based on the endosymbiont theory for the origin of mitochondria the utilization of hsp60 in the process of folding and assembly of imported proteins adds to the recently described evolutionarily conserved steps involved in the intramitochondrial sorting pathways of proteins of the intermembrane space[19,20]. Although the gene for hsp60 would have emigrated to the nuclear compartment at some point after the endosymbiotic event, the acquisition of a leader peptide permitted the gene product to remain in the mitochondria. An hsp60-related function may also be present in other cellular compartments of probable endosymbiotic origin. In chloroplasts, such a function is obviously present as indicated by structural similarity of the Rubisco subunit binding-protein α-subunit to both groEL and hsp60 and by its role in the assembly of the oligomeric Rubisco complex[21,26,27]. As defined by Ellis and colleagues[21,23] the groEL and Rubisco subunit-binding protein belong to one class of so-called 'molecular chaperones' termed 'chaperonins'. Our findings qualify the hsp60 protein of the mitochondrial matrix as a member of the 'chaperonin' class in a functional context. The involvement of protein factors, in particular heat-shock proteins, in folding and assembly of polypeptides has been suggested previously[10,38]. Some of these factors, such as cytosolic hsp70, may help in maintaining precursor proteins in a translocation-competent conformation. Other factors may control correct folding of newly synthesized polypeptides. The immunoglobulin heavy-chain binding protein (BiP), also known as GRP78 (refs 39, 40), might belong to this class of factors. The special function of the groEL/hsp60 family appears to be in actively catalysing the acquisition of the native conformation of oligomeric proteins. Our data strongly support the concept of protein-catalysed assembly of proteins entering the mitochondrial matrix space.

We thank A. West for help with RNA blot analysis, Dr M. Douglas for supplying anti-$F_1\beta$ antiserum and providing advice on $F_1\beta$ assembly, and S. Meier for technical assistance. Ultra-luminous OH maser emission from an IRAS galaxy

L. Staveley-Smith*, D. A. Allen*, J. M. Chapman*, R. P. Norris† & J. B. Whiteoak†

* Anglo-Australian Observatory, PO Box 296, Epping, New South Wales 2121, Australia
† CSIRO Division of Radiophysics, PO Box 76, Epping, New South Wales 2121, Australia

Since the discovery[1] in 1982 of intense hydroxyl (OH) maser emission from the infrared-luminous galaxy Arp 220, twenty similar sources have been found in single-dish radio searches[2–7]. These so-called OH megamasers are associated with infrared-luminous galaxies with far-infrared colour temperatures of about 50 K. Here we report the detection of luminous OH maser emission in the galaxy IRAS20100–4156. This galaxy, at redshift $Z = 0.129$, displays similar optical properties to Arp 220, but exceeds it in OH luminosity by well over an order of magnitude, making it the most luminous OH maser known. The existence of such luminous megamasers increases the volume of space accessible for their study by a factor of about 50.

The generally accepted physical mechanism for OH emission in megamasers is the amplification of a centrally located continuum source by OH molecules in galactic molecular clouds[8]. The OH lines are most prominent at the main-line frequencies of 1,665 and 1,667 MHz and have velocity widths in excess of 100 km s^{-1}. Isotropic OH luminosities in the range 10^2–$10^3 L_\odot$ are typical, although a class of lower-luminosity sources (1–10 $L_\odot$) of somewhat smaller pumping efficiency is also known to exist (for example, NGC3690, NGC4418, IC5298).

Most searches for OH megamasers so far have been conducted using telescopes in the Northern Hemisphere. The only major search for sources in the Southern Hemisphere[9] was limited to galaxies with 60-μm-flux densities >10 Jy. We are now extending that survey to include IRAS galaxies with fluxes <10 Jy. The candidate objects have been selected by means of the distinctive far-infrared colours[10] of megamasers. Those which appear to be extragalactic, on the basis of identification from SERC sky survey films, are being searched for maser emission. Redshifts are being obtained with the Mt Stromlo 1.9-m reflector. A full description of this survey will be given on completion.

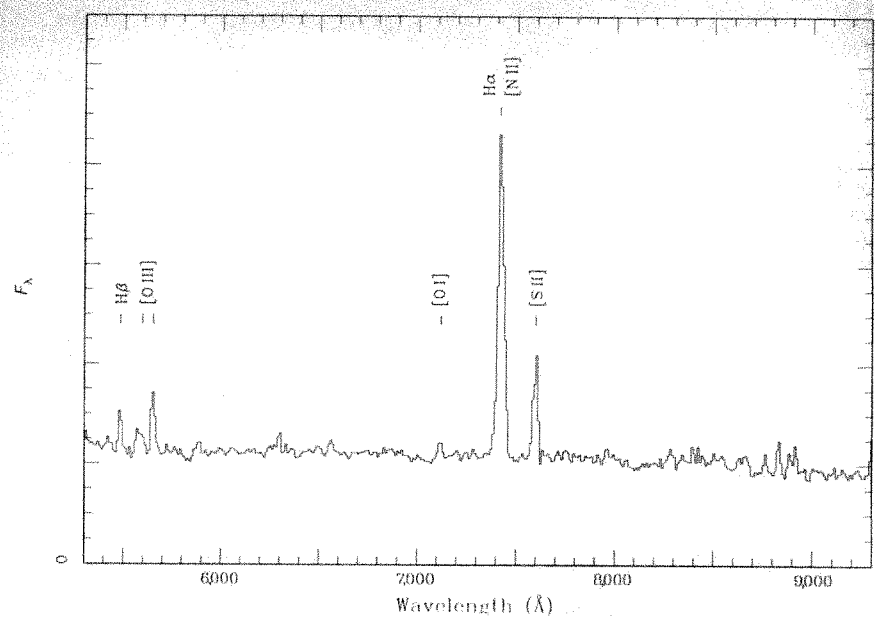

Fig. 1 Spectrum of IRAS20100-4156 taken with the Faint Object Red Spectrograph on the 3.9-m Anglo-Australian Telescope. Exposure time is 1,000 s and resolution is 20 Å. Vertical scale is flux per ångström in arbitrary units.

Low-dispersion optical spectra of IRAS20100-4156 were obtained during the period 5–9 September 1988 using a photon-counting array on the Mt Stromlo 1.9-m telescope. A resolution of 12 Å and a wavelength coverage of 3,600–8,000 Å were used. A further spectrum, shown in Fig. 1, was taken on 27 October 1988 during PATT service time on the 3.9-m Anglo-Australian Telescope (AAT) using the Faint Object Red Spectrograph to cover the wavelength range 5,300–9,300 Å. The emission lines detected were Hα/[N II], Hβ, [O I], [O II], [O III] and [S II]. The mean redshift of this object deduced from the AAT data, is 0.1291 ± 0.0002. From the line ratios, the object may be classified, using the diagrams of Veilleux and Osterbrock[11], as a low-ionization nuclear emission-line region (LINER). There is no indication of broad Seyfert-like lines.

Radio observations of IRAS20100-4156 were taken on 28 and 29 September 1988 using the Parkes 64-m telescope with the Australia Telescope prototype broad-band receiver. Typical system temperatures were 40 K. Spectra were obtained using the Parkes digital correlator. A bandwidth of 10 MHz was used, with 256 spectral channels in each of two orthogonal linear polarizations and in each of two frequency bands. An on-source integration time of 4,200 s was obtained for the redshifted OH 1,665- and 1,667-MHz main-lines, and of 3,000 s for the redshifted OH 1,720- and 1,612-MHz satellite line frequencies. Corresponding spectra are shown in Fig. 2. The velocity scale is heliocentric and is plotted in the optical convention ($v = c\Delta\lambda/\lambda_0$). The frequency resolution is 80 kHz, equivalent to a rest-frame velocity resolution of 16 km s^{-1} for the redshifted OH lines. Spectral interference, denoted by the gap in the spectrum in Fig. 2, was noted only for the 1,720-MHz observations.

Figure 2 reveals intense OH main-line emission with a peak flux density of ~200 mJy. The strongest emission peak, from the 1,667-MHz ($F = 2 \rightarrow 2$) transition, occurs at $38{,}697 \pm 3$ km s^{-1}; there is also a secondary peak at 38,648 km s^{-1}. A marginal detection of the 1,665-MHz ($F = 1 \rightarrow 1$) transition is also observed at 39,044 km s^{-1}, corresponding to a true velocity of 38,646 km s^{-1}, which is close to the velocity of the secondary blueshifted 1,667-MHz peak. No features are detected at the satellite line frequencies of 1,612 and 1,720 MHz. For the parabolic baseline fitted in Fig. 2, the 1,667:1,665-MHz peak-flux-density ratio is ≥ 8. Figure 2 also shows a pedestal of 1,667-MHz emission which extends over a velocity range of ~500 km s^{-1}. The total velocity range may, however, be considerably greater if, as we suspect, some of the parabolic baseline we have fitted is actually genuine line emission. Independent main-line spectra consistently appear to show extended emission over a total velocity range up to 1,500 km s^{-1}. However, because this velocity range is comparable with the total bandwidth of the observations, further observations are required to confirm it. OH emission over a broad velocity range (300–1,000 km s^{-1}) has been found in several other luminous megamasers[5,12,13]

Table 1 summarizes the properties of infrared and OH emission from IRAS20100-4156. A far-infrared (1–500 μm) luminosity of $3.0 \times 10^{12}\ L_\odot$ has been calculated[14], by ignoring the 12-μm contribution, for which only an upper limit is available, and by using a Hubble constant $H_0 = 75$ km s^{-1} Mpc^{-1}. In common with other strong OH emitters, IRAS20100-4156 is therefore extremely luminous in the far-infrared. On the basis of the SERC sky-survey films, IRAS20100-4156 seems to be compact, with an overall diameter of 10 arcsec. It shows a double structure, with components separated by 3 arcsec, corresponding to a projected linear separation of 8 kpc. The optical morphology is similar to that of Arp 220 and to other high luminosity infrared galaxies[15], and the unusual nature of this morphology suggests that, in common with most of these other galaxies, IRAS20100-4156 is a merger.

The OH luminosity of IRAS20100-4156 of $9.3 \times 10^3\ L_\odot$, obtained by subtracting the parabolic baseline in Fig. 2, considerably extends the luminosity range for megamasers. It is greater than the strongest megamasers known previously (Mrk

Table 1 Properties of IRAS20100-4156

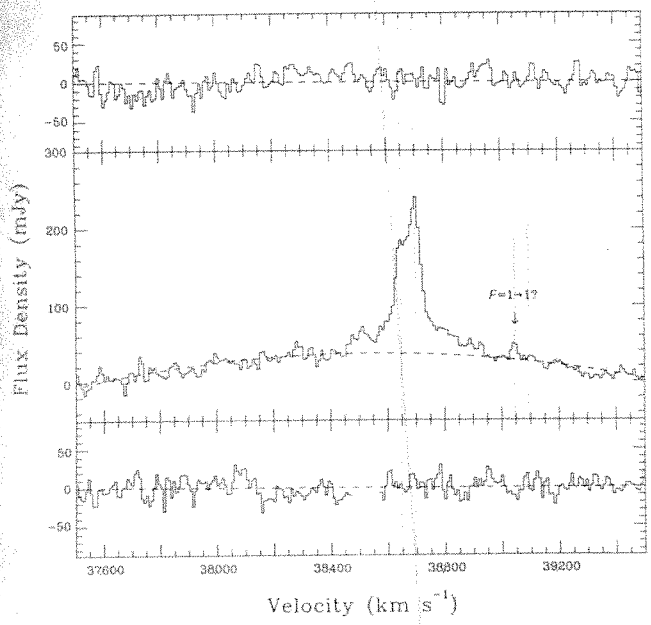

Fig. 2 Spectra of IRAS20100-4156 for the hyperfine transitions of OH at wavelength 18 cm, taken with the Parkes telescope. Velocities are in the optical convention ($c\Delta\lambda/\lambda_0$) with respect to a heliocentric rest frame. The dashed lines represent the instrumental baselines fitted to each of the three spectra. For the two satellite lines (top ($F=1\rightarrow2$) and bottom ($F=2\rightarrow1$)) these correspond to a constant flux density. For the main-lines (middle), a parabolic baseline is fitted. Some of the latter may, however, be genuine line emission (see text). The vertical dotted lines plotted at 38,648 and 38,697 km s^{-1} indicate the velocities of the two emission peaks in the $F=2\rightarrow2$ transition.

231, IRAS12112+0305 and IRAS17208-0014) by almost a factor of ten. The pumping efficiency given by the flux density ratio of OH emission to 60-μm emission, $f_{OH}/f_{60}=0.04$, is also higher than that of other megamasers. Such a high apparent efficiency provides a firm constraint for theoretical pumping models and, in particular, does not support the standard main-line pumping schemes[16,17]. For IRAS20100-4156 there is, however, no significant deviation from the quadratic relationship between OH and far-infrared luminosity which has been postulated[18] for megamasers.

The extreme luminosity of IRAS20100-4156 raises the prospect of detecting similar sources at much higher redshifts. At Parkes, sensitivity considerations limit the maximum attainable redshift to ~0.4 for such sources. This is also the limit at which it becomes difficult to select possible candidates from the IRAS Point Source Catalog. Although it is possible that a strong evolutionary trend could be detected with such a modest redshift range, ideally redshifts of order unity would be required to detect significant changes in number density or luminosity. Although such studies are feasible with the largest radio telescopes, and of much interest in exploring the connection between ultra-luminous infrared galaxies and quasars, the depth of existing far-infrared surveys presently precludes the detection of such high-redshift OH megamasers. Nevertheless, the detection of IRAS20100-4156 implies that, for observations with Parkes and similar radio telescopes, the volume of space accessible for the study of luminous megamasers is greater than was previously thought by a factor of ~50.

Detection of microvariability for BL Lacertae objects

H. R. Miller*, M. T. Carini* & B. D. Goodrich†

* Department of Physics and Astronomy, Georgia State University, Atlanta, Georgia 30303, USA
† National Optical Astronomy Observations, PO Box 26732, Tucson, Arizona 85726-6732, USA

Large-amplitude, rapid optical variability is a well-known identifying characteristic for BL Lacertae objects ('blazars'). Although large-amplitude variations on timescales ranging from days to decades have been well documented[1], considerable controversy surrounds the nature of microvariability, that is, optical variations on timescales significantly shorter than a day. Here we report observations of BL Lacertae in which rapid changes were detected in the total optical flux from this object. These variations occurred on timescales as short as 1.5 hours. Although their structure is complex, the minimum timescale for the variations may be used to place constraints on the size of the emitting region. Assuming that these variations are produced in the vicinity of a supermassive black hole, the timescales imply a black-hole mass of $1.42\times10^9\,M_\odot$. Relativistic beaming need not be invoked to account for the present luminosity of this object.

Photoelectric photometry[2] of BL Lac suggested the possible existence of low-amplitude, short-term variations, but subsequent observations[3,4] failed to detect them. More recently, rapid changes have been observed[5,6] in the polarization for BL Lac on timescales significantly shorter than a day. These results have motivated our observational programme to study, using modern CCD (charge-coupled device) detectors, the nature and indeed the existence of microvariability for a selected sample of blazars. Here we report the first results of this study for the prototype of this class of objects, BL Lac.

The observations reported here were obtained with the No.1 0.9-m telescope at Kitt Peak National Observatory equipped with a direct CCD camera and an auto-guider. The observations were made through a V-filter with an RCA CCD. Repeated exposures of 90 s each were obtained of the star field containing BL Lac. Other stars on the frame provide comparisons for use in the reduction process. The observations were reduced using the method of Howell and Jacoby[7]. Each exposure is processed through an aperture-photometry routine which reduces the data as if it were produced by a multi-star photometer. Differential magnitudes can then be calculated for any pair of stars observed on the frame. Thus simultaneous observations of the object of interest and several comparison stars allows one to remove variations arising from fluctuations in atmospheric transmission and extinction.

The light curves for observations of BL Lac obtained on 11 and 14 July 1987 are shown in Figs 1 and 2 respectively. The upper panel in each figure displays the differential magnitude between comparison star 2 and BL Lac; the lower panel displays the differential magnitude between comparison star 2 and com-

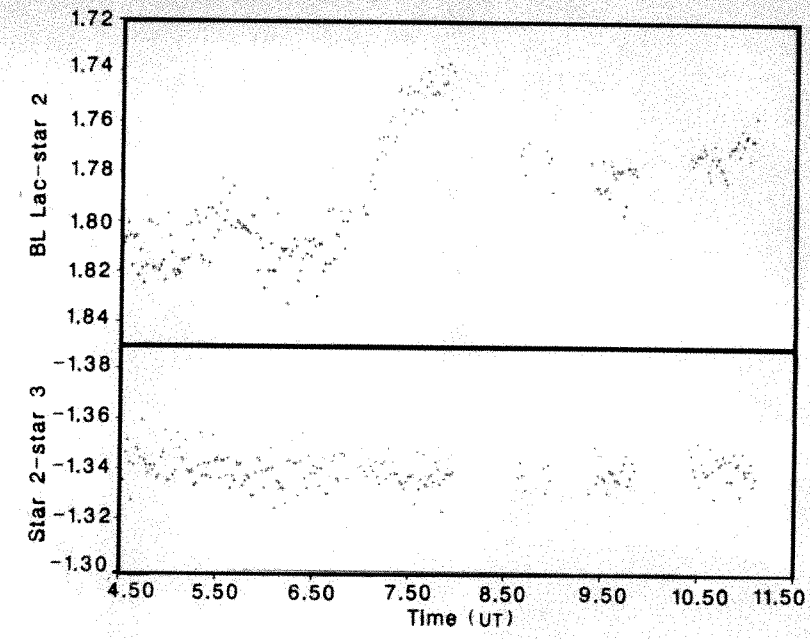

Fig. 1 Top, Differential magnitude between the variable BL Lac and comparison star 2 for the night of 11 July 1987. Bottom, Differential magnitude for comparison star 2 and comparison star 3 for the same night.

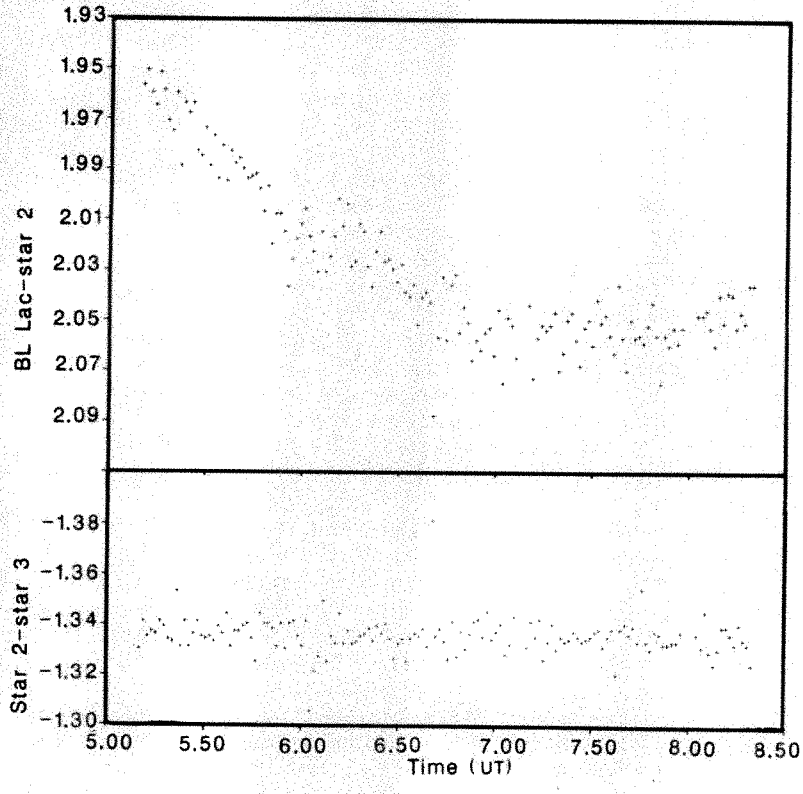

Fig. 2 Top, Differential magnitude BL Lac and comparison star 2 for the night of 14 July 1987. Bottom, Differential magnitude for comparison star 2 and comparison star 3 for the same night.

parison star 3. In each case, the scatter of the differential magnitudes in the lower panel provides an indication of the stability of the standard stars used in reducing these observations, and of the overall observational uncertainty.

On 11 July 1987 (Fig. 1) BL Lac was observed continuously for ~7 hours. From 04:30 to 06:30 UT, the source exhibited only mild variations, with a range of ~0.05 mag, and no conspicuous trends. From 06:30 to 08:00 UT, however, the microvariability of BL Lac could be characterized by a pronounced linear rise in brightness with a total change of ~0.12 mag. The source faded subsequently by ~0.04 mag, and exhibited no significant trends during the last three hours of the night.

On the night of 14 July 1987 (Fig. 2), the microvariability of BL Lac exhibited a decline of ~0.14 mag from 05:00 UT to 07:00 UT, but no systematic trends in brightness variations during the remainder of the night.

On 11 July 1987, when the microvariability exhibited a relatively complicated structure, BL Lac was near a brightness of $V = 15.0$ mag. This is near the middle of the range in brightness exhibited by the source in the past. It was slightly fainter (~0.25 mag) on 14 July 1987, when the steady decline in brightness was observed.

From a power-spectrum analysis of the time series on each of the nights we find no evidence for periodic modulations or the variations such as those reported for the blazar OJ287.

If one assumes that the microvariability detected for this object is generated in the vicinity of a supermassive black hole one can estimate the size of the emitting region as $R =$

assuming no relativistic beaming. The timescale identified from the present observations is the time during which the dramatic 0.12 mag. variation occurred on 11 July 1987. The duration of this event is approximately 1.5 hours. If one uses the timescale of this event to define a 'characteristic timescale' and one assumes that the radiation is generated close to the black hole, for example $R = 3R_s$ where $R_s = 2GM/c^2$ is the Schwarzschild radius, then the mass of the supermassive black hole, M, is given by $M = c^3 t/6G = 1.42 \times 10^9\ M_\odot$. The Eddington luminosity for a black hole of mass M is given by[9] $L_E = 1.3 \times 10^{38}\ (M/M_\odot)$ erg s^{-1} which in this case yields $L_E = 1.85 \times 10^{47}$ erg s^{-1}. For a brightness of ~15.0 mag, the luminosity for BL Lac is of the order of $L_v \approx 10^{45}$ erg s^{-1}.

Thus we find that although microvariability is definitely present on very short timescales, which in turn suggests a very small source region, the luminosity of BL Lac is significantly less than the Eddington luminosity, and does not require relativistic beaming for its explanation.

We thank NOAO and Lowell Observatory for generous allocations of observing time. H.R.M. is grateful for support from the Research Grant Program at Georgia State University.

A Solar System dust ring with the Earth as its shepherd

A. A. Jackson* & H. A. Zook†

* Lockheed Engineering and Science Corporation, C23, 2400 NASA Rd 1, Houston, Texas 77058-3711, USA
† SN3, NASA Johnson Space Center, Houston, Texas 77058, USA

Bodies orbiting in the gravitational fields of galactic, solar or planetary systems often suffer dissipative forces, including tidal interactions and drag resulting from motion through a gas or from collisions with dust grains. In the early solar nebula, gas drag induces resonance trapping, which may be of importance in the early accretional growth of planets[1–3]. By means of numerical integrations, we show here that small dust grains can be temporarily captured into exterior orbit–orbit resonances with the Earth, lasting from less than 10,000 years to more than 100,000 years. Grains with radii of 30–100 μm, orbiting in planes less than 10° from the plane of the Solar System and with orbital eccentricities of less than 0.3, are captured most easily. We argue that there should be an approximately toroidal cloud of particles, derived mostly from the asteroid belt, trapped into a variety of these exterior resonances. The cloud is mostly beyond the Earth's orbit, but includes it.

Three factors primarily motivated the present study. (1) The narrow bands observed along the ecliptic in the IRAS (Infrared Astronomical Satellite) data clearly seem to originate from dust particles in the main asteroid belt[4,5]; indeed, asteroid collisions may provide most of the dust grains that give rise to the entire broad band of observed zodiacal thermal emission[6]. (2) Grains smaller than ~100 μm in radius should successfully survive collisional destruction[7] to spiral in, under Poynting-Robertson[8] (P-R) and solar-wind drag, to well within the orbits of the Earth and Venus. (3) Venus and the Earth significantly perturb[9,10] the orbits (which are shrinking under P-R drag) of dust grains that pass these planets.

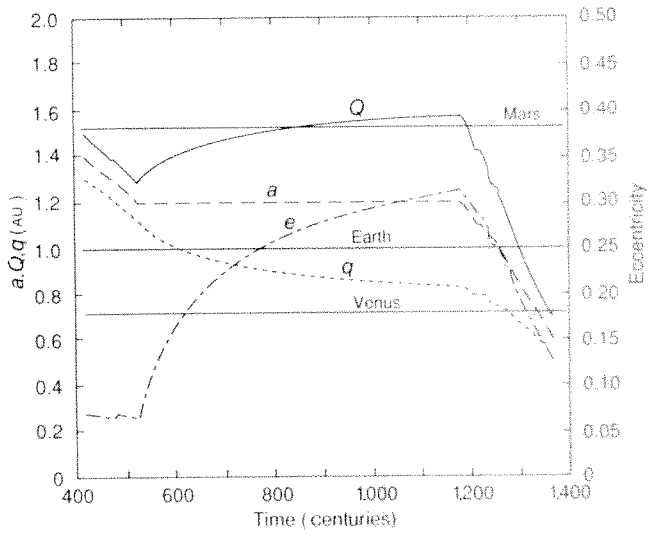

Fig. 1 Semi-major axis, a, aphelion distance, Q, perhelion distance, q, and eccentricity, e, as functions of time (in centuries) for a 30-μm radius particle started in an orbit with $a = 2.0$, $e = 0.1$ and an orbital inclination of 2.0°.

Some effects from dissipative forces in the Solar System have been noted. Gas drag, for example, can trap small bodies into $j:k$ orbital-period commensurabilities with a massive perturbing body (such as an accreting planet); here j and k are integers. Orbit-period commensurabilities of the type $j:j+1$ are often observed. Gonczi *et al.*[11] noted that, under P-R drag, small dust grains that were initiated in orbits at the interior 2:1 resonance with Jupiter could remain trapped there for some time; they did not, however, find any evidence for dust grains drifting, under P-R drag, into that resonance and becoming trapped.

Although our conclusions are consistent with those of Gonczi *et al.*, we also obtain new and different results (reported earlier in preliminary form[12]). These new results include long-term trapping (for more than 100,000 years) into resonances exterior to the Earth's orbit, short-term trapping (for typically less than 10,000 years) into resonances exterior to the orbits of Mars and Venus, and some limited trapping into interior resonances. For calculations we used Cowell integration in cartesian coordinates using the Everhart[13] implicit Runge-Kutta integrator with Gauss-Radau spacings. Radiation pressure is included and opposes the effect of solar gravity, with the assumption that particles behave as spherical black bodies of density 1 g cm^{-3}. The only other forces included are P-R drag and solar-wind drag, with the latter assumed to be 30% of the former. Solar-wind drag is included by multiplying by 1.3 the vector velocity term given by equation (5) in Burns *et al.*[14]. Many simulation runs incorporated the effect on the particles of the gravitational fields of the Sun, Venus, the Earth, Mars and Jupiter. To reduce computation, however, most runs included only the gravitational fields of the Sun, Venus and the Earth, and many were done with only those of the Sun and the Earth.

The trapping dynamics are best illustrated for the simplest case in which only the Sun, the Earth and a dust grain are involved. This case is shown in Fig. 1, where the orbital evolution of a particle of radius 30 μm is initiated with a semi-major axis, a, of 2.0 AU, an orbital eccentricity, e, of 0.1, and an orbital inclination of 2.0°. The plot starts at 40,000 years into the simulation. For the first 52,000 years, a decreases on average, under P-R and solar-wind drag, at a rate of 7.3 cm s^{-1}. The particle is then trapped into an external 3:4 resonance with the Earth at $a = 1.2037$ AU for the next 65,000 years; during this trapping period, a remains approximately constant, e increases, the perihelion distance, q, decreases to less than that of the

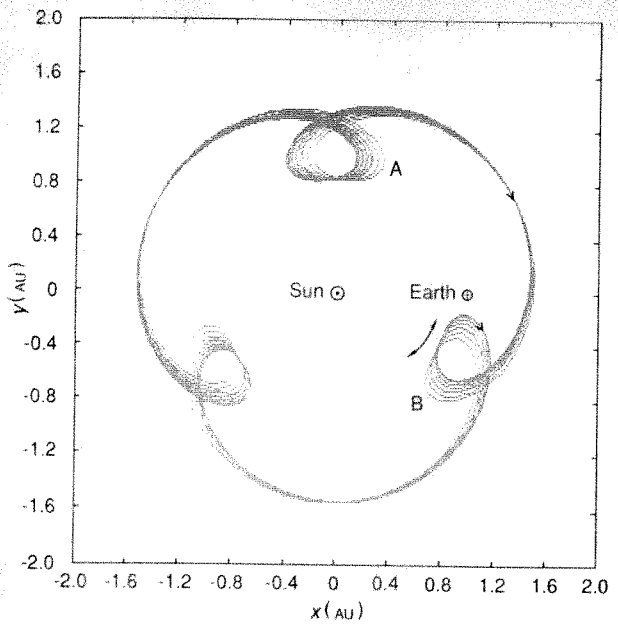

Fig. 2 The motion of the dust grain in Fig. 1, in a heliocentric coordinate frame rotating with the Earth. Shown here is the trajectory for 50 years of motion, projected onto the ecliptic, starting at 90,000 years into the simulation. The orbital motion tends to repeat itself in 220 years during quasi-stable trapping into the 3 : 4 external resonance with the Earth.

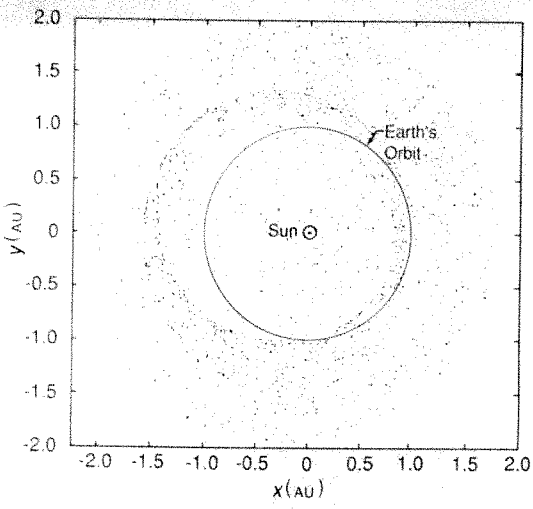

Fig. 3 The position of the particle for the orbit in Fig. 1, projected onto the ecliptic plane as a point approximately every 93 years as it evolves under gravitational and drag forces. The density enhancement arising from shepherding by the Earth is clearly evident.

Earth, and the aphelion distance, Q, increases. This trapping resonance is by no means unique: depending on the initial dust-grain orbital parameters, we have observed trapping in essentially all $j:j+1$ external resonances with the Earth from 2:3 to 13:14 (the latter for an initially circular orbit inclined at 10° to the ecliptic). We have also observed trapping into the 3:5 and 1:1 resonances. The 1:1 resonance resulted from the trapping of a 100-μm radius dust grain released from Comet Encke into a 'circulator' (rather than a horseshoe-shaped 'librator') resonance with the Earth.

Insight into the dynamics of the trapping can be obtained by transforming to a Sun-centred coordinate system rotating with the Earth's orbital motion. Figure 2 depicts particle motion, as viewed from ecliptic north, in such a coordinate system for 50 years, starting at 90,000 years into the same run as shown in Fig. 1. The Earth is shown to the right in this plot. At aphelion, the dust grain orbits more slowly around the Sun than does the Earth, and so moves in a clockwise fashion in this diagram. At perihelion, dust-grain orbital motion is faster than that of the Earth, and the grain moves in an anticlockwise direction. This pattern of motion gives rise to the three loops that are made during the four years that the particle takes to approximately retrace its path in this 3:4 resonance. The particle does not, however, exactly retrace its path on each orbit, because it is seldom precisely in the 3:4 resonance but only near it, in a quasi-stable trajectory, during the 65,000 years that it remains trapped. When the particle approaches relatively near, but trails orbitally behind, the Earth, just after particle perihelion passage, it receives a boost in orbital energy which increases its orbital semi-major axis a. If a becomes larger than the semi-major axis appropriate for the 3:4 resonance, then the dust grain has not quite completed three orbits by the time that the Earth has made four orbits. This causes the loops in the dust grain's orbit (Fig. 2) to drift in a clockwise direction. If this drift continues far enough, the gravitational downward 'kick' in the orbital energy of the dust grain can exceed the upward kick, because the dust grain now approaches closer to the Earth in loop A than in loop B. The orbital energy of the dust grain then decreases under both the Earth's gravitational force and the P–R and solar-wind drag forces until a becomes smaller than the resonance value. The loops then drift in an anticlockwise direction, and so on in a cyclic fashion. A high-resolution plot of semi-major axis against time clearly shows that a varies continuously throughout the trapping period to values both above and below the exact 3:4 resonance value of $a = 1.2037$.

In Fig. 3, we show the position of the particle projected as a point onto the ecliptic plane every 93.4377 years. It is clearly seen that the trapping phenomenon leads to an increased particle density near, but mostly outside of, a distance of 1 AU. The particle density is not uniform in heliocentric longitude because the line of apsides of the particle's orbit rotates by only ~180°, non-uniformly in time, during this particular trapping event. The orbital inclination of the particle in Figs 1, 2 and 3 remained near 2° throughout the trapping period, following which it varied rapidly to ~8°.

Large grains are trapped more easily into one of the external resonances than are small grains. Our numerical experiments have not generated a resonance with Mars for particle radii less than 60 μm. Large grains also tend to be trapped into resonances that have larger semi-major axes than those of small grains, and they stay trapped for longer periods of time. This can be explained by the relative rapidity with which small grains progress through a resonance trapping zone, a condition already noted for other types of trapping[15]. Grains with radii less than 10 μm are seldom trapped by the Earth or Venus and, when trapped, remain so only for very short periods. Grains of radius 30 μm are typically trapped exterior to the Earth for time spans of ~30,000 years, although they occasionally escape trapping altogether (even for orbits of low e and inclination). The overal physical process may be described as the 'shepherding' of dus grains into external orbit–orbit resonances by the combine perturbations of the Earth's gravity and P–R and solar-win forces. Mars is a less effective trapper because of its small mas and Venus loses trapping effectiveness primarily because gravitational disturbances from the Earth.

The question now arises as to whether or not any observation evidence exists for the dust ring that we predict near the or of the Earth. There are two sets of observations that are co sistent with, but not definitive proof of, a near-Earth dust ri The first of these is the detection of micrometre- to sub-micro etre-sized meteoroids by the Pioneer 8 and 9 spacecraft. Zoo has suggested that these could be created by collisions i

population of larger parent meteoroids whose spatial density increases with increasing heliocentric distance near 1 AU. McDonnell *et al.*[17], on the other hand, showed that the measurements could also be interpreted on the basis of a spatial density varying with heliocentric longitude. Which interpretation is correct should be resolved with the dust sensor on the Galileo spacecraft scheduled for launch in 1989.

The second set comprise zodiacal-light observations. In an examination of the zodiacal-light data gathered by the Helios spacecraft, Leinert *et al.*[18] failed to find the spatial-density increase suggested by Zook[16]. It is possible, however, that a low-intensity narrow ring near the Earth would not be easily detected by the photometers on Helios, because they did not make observations along the ecliptic plane. On the other hand, it may be significant that the spatial density of particles derived from zodiacal-light studies varies as $r^{-1.3}$ inside a radius of 1 AU (ref. 19) but as $r^{-1.5}$ or higher inverse powers[20,21] outside of this. Such a result could be caused by a dust ring near the Earth.

We thank Dr E. Everhart for sending us a copy of his numerical integration program and Dr Shin-Yi Su for independently programming and verifying the capture phenomena. We also greatly appreciate a review by Dr J. Burns.

Detection of methyl, hydroxymethyl and hydroxyethyl hydroperoxides in air and precipitation

E. Hellpointner & S. Gäb

Gesellschaft für Strahlen- und Umweltforschung mbH München, Institut für Ökologische Chemie, D-8050 Freising-Attaching, FRG

It is well established that organic peroxides are formed by OH-radical-induced oxidation of hydrocarbons under atmospheric conditions[1]. Peroxyacyl nitrates have been known to be constituents of polluted air since the 1950s[2,3]. In a recent study we have shown that the gas-phase reaction of ozone with a variety of natural and anthropogenic alkenes can contribute to the formation of hydrophilic organic peroxides[4]. Indications that such peroxides are actually present in the environment have been obtained previously by measurements of the peroxide content of cloudwater and rain. In the absence of a specific analytical method the peroxide content after selective enzymatic destruction of the hydrogen peroxide was taken to be the organic peroxide fraction[5–7]. In this letter we report the determination by high-performance liquid chromatography of methyl (MHP; CH_3OOH), hydroxymethyl (HMP; $HOCH_2OOH$) and 1-hydroxyethyl (HEP; $CH_3CH(OH)OOH$) hydroperoxides, in addition to H_2O_2, and present some preliminary concentration ranges in air and precipitation. The existence of this class of atmospheric trace constituents raises questions about possible adverse biological effects.

Although reversed-phase high-performance liquid chromatography (HPLC) is one of the most important methods of separating polar compounds in aqueous solution, it has been little used in the search for products of tropospheric photooxidation. It is superior to gas chromatography in the detection of thermally unstable substances. The method described here (Fig. 1) exploits the stability of hydroxyalkyl hydroperoxides in cold acidic solution by using HPLC to separate them from H_2O_2, which is normally present in much higher concentrations. Directly after separation, both the temperature and the pH of the eluate are increased to convert the hydroxyalkyl hydroperoxides to H_2O_2 and the corresponding aldehydes. H_2O_2 is then detected by the highly specific and sensitive *p*-hydroxyphenyl ethanoic acid/peroxidase fluorescence reaction[8]. Any H_2O_2 initially present in the sample is eluted first from the HPLC column and is detected directly. MHP is also detected directly; it is stable to the higher temperature and pH, but reacts in the presence of horseradish peroxidase.

The peroxides were identified by comparison of their retention times with those of standards (Fig. 2 and Table 1) or by admixture of standards to the samples. The limit of detection is 0.07 μmol l^{-1}, corresponding to 1.4×10^{-6} μmol per 20 μl of

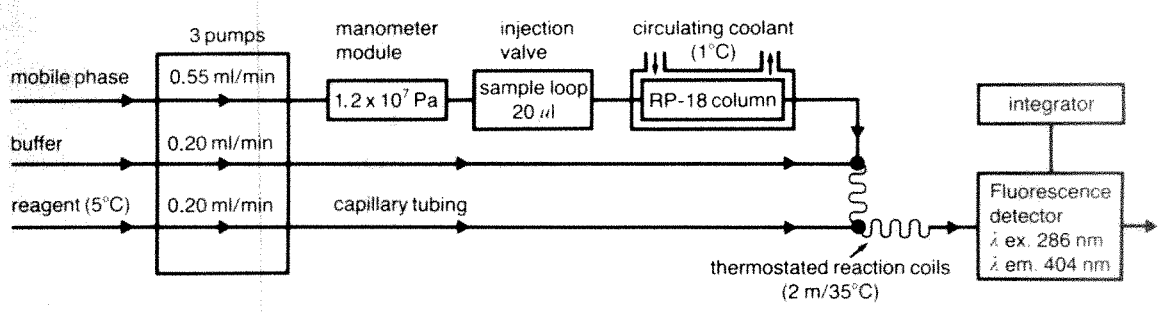

Fig. 1 Analytical system. HPLC: ABIMED, 3 Units Gilson model 302, 5 SC, Manometer module Gilson 802 C. Capillary tubing: o.d. 1/16", i.d. 0.12 mm. Injection valve: Rheodyne 7125. Cryostat: mgw Lauda K2R. Column: Bischoff Type NCi, 4 × 250 mm. Packing: 5-μm Shandon ODS Hypersil. Detector: Hewlett Packard HP 1046 A. Integrator: Hewlett Packard HP 3390. Water: deionized, distilled from $KMnO_4$, freed from traces of H_2O_2 with catalase, and redistilled. Mobile phase: diluted H_3PO_4, pH 3.5. Buffer: 0.01 M KH_2PO_4/NaOH, pH 9.4. Reagent: 0.5 mg *p*-hydroxyphenylethanoic acid (Merck) and 2 mg horseradish peroxidase (EC 1.11.1.7, ~170 U per mg, Merck) in 100 ml 0.01 M KH_2PO_4; 2 mg *p*-hydroxyphenylethanoic acid at peroxide concentrations > 10 μmol l^{-1}. At concentrations > 50 μmol l^{-1} the sample is diluted.

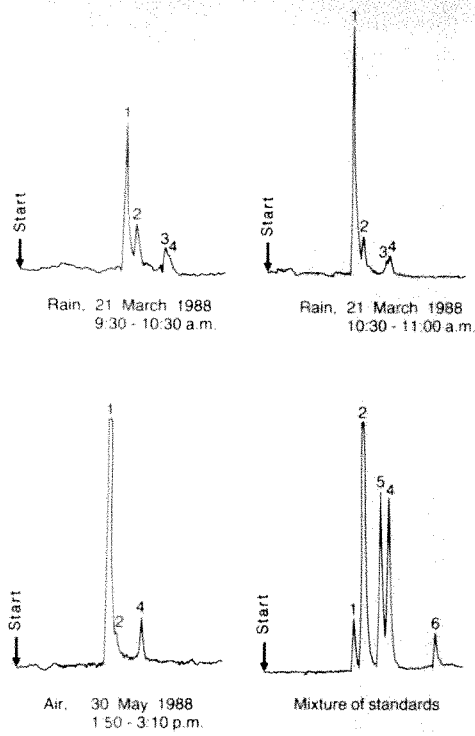

Fig. 2 Typical chromatograms (samples taken at Freising/Munich). See Table 1 for identification of peaks.

sample. Quantification was based on standard solutions of H_2O_2, MHP and bis(hydroxymethyl)peroxide (BHMP; $HOCH_2OOCH_2OH$) at a concentration of 1 mmol l^{-1} (iodometric titration). Calibration curves for freshly prepared equimolar dilutions of these were identical up to 10 μmol l^{-1}. HMP and HEP were not available as pure compounds, but always contained small amounts of H_2O_2 and the corresponding bis(hydroxyalkyl)peroxides, so that the calibration was only approximate. The linear range for H_2O_2 can be extended to 50 μmol l^{-1} by raising the concentration of *p*-hydroxyphenyl ethanoic acid in the reagent solution, but this is insufficient to extend the linear range for MHP beyond 10 μmol l^{-1}. Increased reagent also leads to a higher noise level and thereby to a loss in sensitivity. Because of the small difference in retention time ($\Delta R_t = 0.53$ min), the detection of HMP is difficult in the presence of much larger amounts of H_2O_2 (ratios of H_2O_2:HMP > 100:1). HEP and MHP, which have similar concentration ranges in natural samples, are also separated poorly from each other ($\Delta R_t = 0.20$ min). The rapid decomposition of HEP at pH > 7 means, however, that the difference between the peak areas measured in acidic and alkaline solution can be used for the quantification of these two peroxides.

During the period from the beginning of February to the end of March 1988, samples of snow from Freising/Munich had an average H_2O_2 concentration of 0.65 μmol l^{-1}. The highest concentration, 5.5 μmol l^{-1}, was measured on 24 February in a sample of wet snow taken around noon. In 87 of 93 samples the H_2O_2 content exceeded 0.07 μmol l^{-1}. HMP could be found in amounts near the detection limit (concentrations $c \approx 0.1$ μmol l^{-1}) in 11 samples.

Rain samples from the same period had significantly higher H_2O_2 concentrations (mean concentration $\bar{c} = 3.5$ μmol l^{-1}; maximum, $c_{max} = 14$ μmol l^{-1}). In 30 of 75 samples HMP was found at an average concentration of 0.1 μmol l^{-1}. Higher concentrations of HMP ($c_{max} = 0.6$ μmol l^{-1}) were more common in those rain samples having pH < 5.5 (compare data for 21 March 1988 in Table 2); HEP ($c_{max} = 0.3$ μmol l^{-1}), in contrast, was usually found in concentrations near the detection limit and, like MHP ($\bar{c} = 0.1$ μmol l^{-1}; $c_{max} = 0.3$ μmol l^{-1}), seemed to be nearly independent of pH in the range 4.4–6.1.

The peroxide concentration in 32 rain samples taken in April and May 1988 varied much more widely; for example, only 0.5 μmol l^{-1} H_2O_2 was found in water from a heavy shower at 1 p.m. on 20 May, whereas a light drizzle around noon on 17 May contained 110 μmol l^{-1}. HMP and HEP were not detectable on 16 and 17 May 1988 (Table 2); this can undoubtedly be attributed to the high pH (6.4–7.4) of the samples. In acidic rain (pH < 5.5) the relative concentrations of H_2O_2, HMP, HEP and MHP were typically 10, 0.7, 0.1 and 0.2 respectively; HMP, HEP and MHP attained maximum concentrations of 1.1, 0.3 and 0.5 μmol l^{-1} respectively. BHMP and perethanoic acid, though readily detected by the present method, have not been found in precipitation.

After extended periods of fine weather the first rain, typically with high pH values, contained little H_2O_2, no HMP or HEP and average amounts of MHP. One or two hours later, however, peak concentrations of H_2O_2 were reached at a pH that was still relatively high. Only as the pH dropped, with prolonged rain, could hydroxyalkyl hydroperoxides be found, along with average amounts of H_2O_2.

Analyses of 17 aqueous samples obtained by freezing water out of the air at −70 °C (Table 3) also attest to the presence of MHP; higher concentrations tend to occur before noon (c_{max} = 179 parts per 10^{12} by volume). As is to be expected from the higher pH(> 7), HMP and HEP could not be detected in samples taken in the morning. HMP could be found in some samples with pH ≈ 6 ($c_{max} = 15$ parts per 10^{12} by volume), but only if the analyses were carried out immediately after thawing.

The total peak area of the peroxides observed in particularly acidic rain samples was often less than that of the H_2O_2 peak found after making the sample basic. This indicates that part of the H_2O_2 is initially present in the form of other, as yet undetected, peroxidic compounds. Re-analysis of rain samples that had been stored frozen often gave irregular results (mostly indicating lower peroxide content). Thus, peroxide concentrations should be measured only in fresh samples, and the pH must always be taken into account.

Table 1 Identification of chromatogram peaks

Peak*	Identity	$\bar{R}_t$	Source of standard
1	H_2O_2	5.14 min	Perhydrol (Merck, Darmstadt), 35%
2	$HOCH_2OOH$ (HMP)	5.67 min	For synthesis and properties, see ref. 9.
3	$CH_3CH(OH)OOH$ (HEP)	6.98 min	Synthesis analogous to HMP; ^{13}C-NMR (D_2O/dioxane) $\delta = 21.0$ (q) 101.0 (d).
4	CH_3OOH (MHP)	7.18 min	For synthesis see ref. 10. ^{13}C-NMR (D_2O/dioxane) $\delta = 67.8$ (q); ^{1}H-NMR (D_2O/CH_3COOH) $\delta = 3.85$ (s).
5	$HOCH_2OOCH_2OH$ (BHMP)	6.69 min	For synthesis and properties, see ref. 11.
6	$CH_3C(O)OOH$	9.63 min	Peroxyethanoic acid (Peroxid-Chemie, München) 40%.

0.5 m^3 air at Freising/Munich (1.2 m above ground) was drawn at 6.25 l min^{-1} with a gas sampler (Desaga GS 312) through an efficient cold trap (Brand) at −70 °C; the frozen sample was gently thawed and analysed immediately. ND, not detectable.

* Shoulder of the H_2O_2 peak, not precisely quantified.

In general, peroxide concentrations increased significantly whenever snow turned into rain. It is possible that snowflakes are less capable than raindrops of taking up peroxides while falling or that decomposition reactions occur on the ice crystals, as was observed in the analysis of frozen rain samples. The latter effect might reduce the peroxide content of samples frozen out of air. The analysis of these samples is further complicated by the possibility that some peroxides are not formed in significant amounts until the precursors are concentrated in the cold trap.

The range and the variation with time of the H_2O_2 concentrations in the present study are comparable with those reported by others[5,7,12–14]. In addition, the sum of the organic peroxide concentrations, on average ~1–10% of the H_2O_2 concentration, is in agreement with the values of Kelly *et al.*[5] and Lazrus *et al.*[7]. The occasional exceptionally high values of more than 30% organic peroxide in refs 5 and 7 were also found in very acidic rain samples. The absence of BHMP (the product of HMP and CH_2O in acidic solution) can be attributed to the low ratio of CH_2O to H_2O_2 in rain water. Perethanoic acid, on the other hand, which has been postulated as an intermediate in the atmospheric degradation of hydrocarbons[1,15], is too rapidly hydrolysed to H_2O_2 and ethanoic acid in dilute aqueous solution to be detected in rain samples by the present method. MHP has been found in simulated atmospheric oxidation of hydrocarbons such as methane and is predicted to be a trace constituent of the troposphere[16–18]. Its low concentration in the air on sunny afternoons and its occurrence in many of our rain samples appear to confirm that photolysis and washing out by rain are major sinks for this peroxide[19].

There are two plausible atmospheric pathways for the formation of hydroxyalkyl hydroperoxides. The main route may be the addition of H_2O_2 to aldehydes under acidic conditions. Of importance in this context is the fact that H_2O_2 creates its own acidic environment by oxidizing the ubiquitous atmospheric SO_2 to sulphate[20,21]. The alternative route to these peroxides involves the addition of water to the so-called Criegee intermediate, R_1R_2COO, of the reaction of ozone and alkenes[22] (R_1 and R_2 are alkyl groups or hydrogen); no acid is required for this addition, but the lifetime of the peroxides is of course far longer

if acid is present. The formation of hydroxyalkyl hydroperoxides was established in our earlier simulations of gas-phase ozonolysis of naturally occurring alkenes (for example, terpenes, isoprene and ethene)[4]. In a recent study[13], concentrations of H_2O_2 were sometimes found to be much higher in a forest than those just outside it, suggesting that some of the H_2O_2 may be formed by decomposition of hydroxyalkyl hydroperoxides produced in the rapid reaction of ozone with biogenic alkenes.

There are too few studies of the effects of the peroxides described here on intact organisms to justify any definite statements about their probable environmental significance. Various physiological effects of HMP have, however, been examined in detail[23,24]. Among these is the irreversible inhibition of horseradish peroxidase. Inhibition of plant peroxidases by low concentrations of HMP might greatly increase the toxic effects of H_2O_2, which have been found in experiments on trees[25]. Damage of a type attributable to peroxides has often been mentioned in descriptions of *Waldsterben* (forest death)[26], but simulations using environmentally relevant concentrations of ozone and peroxyacetyl nitrate, the usual representative photo-oxidants, have failed to reproduce all the symptoms of this damage[27,28]. These studies may have taken too little account of the possibility that the products of ozone, not ozone itself, are responsible for the damage to plants. If during the experiment the reaction products are not allowed to build up in the air surrounding the plants, as they probably do in nature, fumigation with ozone may not produce the effects observed in forests. A recent set of experiments on pea seedlings in a laboratory showed that ozone causes more damage when in combination with stress ethylene[29], a result which is consistent with our suggestion. Studies are urgently needed to determine to what extent and by what route terpene oxidation products, among them the peroxides discussed here, can penetrate plant tissues and what their effects on these tissues are. This work indicates that damage by hydroxyalkyl hydroperoxides should be greater in acidic environments. It is perhaps relevant that there are several reports that ozone and acidity act synergistically in damaging plants[30,31]

Three-dimensional micromagnetic modelling of ferromagnetic domain structure

Wyn Williams & David J. Dunlop

Geophysics Laboratory, Department of Physics, University of Toronto, Toronto, Canada M5S 1A7

The fidelity of magnetic recording materials (whether they be synthetic crystals on a recording tape, or natural crystals in rocks recording changes in the Earth's magnetic field) depends on the uniformity of their magnetic structure. Such structure is determined by minimizing the energies arising from atomic magnetic dipole interactions. Previous micromagnetic models of coupled spin structures have contained well defined constraints to make the calculations tractable. By using a supercomputer, we have been able to perform unconstrained calculations of minimum energy structures for cubic assemblies of up to $22\times22\times22$ exchange-coupled spins. The critical size for transformation from a uniform single-domain structure to a non-uniform three-dimensional structure is about 0.1 μm for magnetite, as found previously from one-dimensional modelling. However, a variety of different non-uniform structures are possible, with energies and magnetic moments much less than those of conventional lamellar domains. The predicted moments of unweighted combinations of these states agree well with experimental measurements on magnetite in the size range 0.08–0.5 μm. Surface spin structures are such as to minimize flux leakage out of the particle and might be misleadingly imaged by the Bitter colloid technique as indicating a single-domain state.

Early micromagnetic models of domains were analytic[1,2], and permitted only a one-dimensional variation in the spin angle between domains of uniform magnetization[3]. Computer techniques have facilitated numerical models that allow non-uniform solutions[4,5]. Although initially such models were one-dimensional, LaBonte[6] and more recently Aharoni and Jakubovics[7], Fredkin and Koehler[26], and Zhu and Bertram[27] have achieved two-dimensional solutions.

One- and two-dimensional solutions have proved useful in investigating the magnetic stability of ferromagnetic crystals[8-10], but there is no doubt that the true magnetization structure is three-dimensional. Here we describe a fully three-dimensional micromagnetic model, in which no constraints are placed on the direction of magnetization and the bodies considered are finite in all three dimensions.

For simplicity, we consider cubes of magnetite in zero external field at room temperature. Generalization to other temperatures, fields, crystal forms and phases is straightforward and will be described elsewhere. Each cube is divided into N^3 sub-cubes. The magnetic moment of any sub-cube is the average over a very large number of atomic spins and is represented by a dipole $\mathbf{m}_i$ at the centre of the sub-cube. All dipoles have the same magnitude m_i but their directions vary.

The contributions to the total magnetic energy of a cube were formulated as described by Brown[11]. (1) The exchange energy, E_E, is due to coupling of the spins $\mathbf{S}_i$ and $\mathbf{S}_j$ of nearest-neighbour atoms:

$$E_E = -2\sum_x\sum_y\sum_z J_E\mathbf{S}_i\cdot\mathbf{S}_j$$

where J_E is the exchange integral. As in other micromagnetic calculations[12], the J_{AB} (inter-sublattice) interaction is assumed to dominate. We also assume linear variations of the atomic spin directions in the x, y and z directions between the centres of the sub-cubes. (2) Magnetocrystalline anisotropy energy, E_A, is due to spin-lattice coupling:

$$E_A = \sum_x\sum_y\sum_z (K_1(\alpha_1^2\alpha_2^2+\alpha_2^2\alpha_3^2+\alpha_3^2\alpha_1^2)+K_2\alpha_1^2\alpha_2^2\alpha_3^2)$$

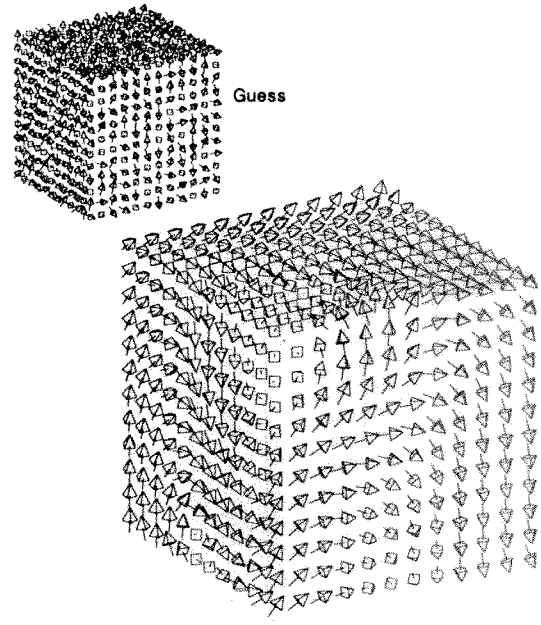

Fig. 1 A minimum-energy state of 12^3 exchange-coupled dipoles, obtained by an unconstrained minimization routine, starting from the initially guessed structure shown in the insert. The minimum-energy state involves no imposed symmetry from a random initial guess. Grain size = 0.2 μm cube. Reduced energy = 0.54. $M_{rs}/M_s = 0.28$.

where K_1, K_2 are the anisotropy constants and α_1, α_2, α_3 are the direction cosines of $\mathbf{m}_i$. (3) Magnetostrictive strain energy, E_S, is due to lattice deformation caused by the magnetization of the crystal:

$$E_S = \frac{3}{2}\sum_x\sum_y\sum_z \lambda\sigma\cos^2\phi$$

where λ is the magnetostriction constant, σ is the magnetoelastic stress and ϕ is the angle between the stress and magnetization direction. (4) Demagnetizing energy, E_D, is due to magnetostatic dipole-dipole interaction:

$$E_D = -\frac{1}{2}\sum_x\sum_y\sum_z \mathbf{m}_i \cdot \mathbf{H}_i$$

where $\mathbf{H}_i$ is the magnetic field at the location of $\mathbf{m}_i$ that results from all the other dipoles.

Stable magnetic structures were determined by finding minima of the sum $E_E + E_A + E_D$, using previously published values for the saturation magnetization[13], the anisotropy constant[14] and the exchange constant[15]. The magnetostrictive energy in magnetite is nearly two orders of magnitude smaller than any of the other energies involved and was not considered further in this initial study. The anisotropy of the solutions shown in Fig. 2 was simplified to a uniaxial anisotropy along the $+z$ direction. Solutions with cubic anisotropy, such as those in Fig. 1, were not significantly different, because of the dominance of magnetostatic energy which strongly favours alignment of spins parallel to crystal surfaces.

The localized energies E_E and E_A are easy to compute. E_D, however, is long-ranged and nonlinear. Even for a relatively low resolution of 12^3 sub-cubes, the demagnetizing energy requires ~1.5 million interaction calculations per iteration. The computation can be reduced considerably by rewriting the demagnetizing energy in the manner of Rhodes and Rowlands[16], as the product of an invariant demagnetizing coefficient and variable equivalent magnetic charges on the surfaces of the sub-cubes[10]. In one-dimensional models, only interaction coefficients between parallel sheets of magnetic charge are needed. For the three-dimensional problem, the interaction coefficients between orthogonal sheets must also be calculated.

The minimization was performed using the conjugate-gradient method on a Cray X-MP/22 supercomputer. Second-order methods converge faster but memory constraints did not allow storage of the hessian matrix. Figure 1 demonstrates the effectiveness of the minimization technique. This minimum-energy state was obtained in just under 50 minutes of computer time from a random initial guess.

Because of the large number of dipoles, numerous different minimum-energy states exist. To make the computations more efficient and allow us to increase the resolution to 22^3 sub-cubes, we next restricted our attention to symmetric solutions in which the structure in a given octant of the cube is either symmetric or antisymmetric with respect to that of a reference octant. Non-symmetric minimum-energy states (such as that in Fig. 1) always had higher energies than corresponding symmetric states with similar features (for example, Fig. 2*d*). All our solutions were tested for stability by removing the symmetry requirement and solving for a new minimum-energy structure.

Symmetric structures of various types are shown in Fig. 2. There are no lamellar domains of the classic Kittel[2] type. Regions of uniform magnetization correspond to areas of constant colours. These domains have dipoles aligned in the $\pm z$ directions. The net moments of the cubes are also aligned in this direction. In the single-domain (or type 1A) solution (Fig. 2*a*) the moments are not all exactly parallel, as in a classical single-domain grain; spins are deflected at the corners, where the demagnetizing field is strongest[17]. As the grain size increases the deflections at the corners become more pronounced. Above ~0.2 μm a new type of structure arises, in which the moments at the cube edges reverse to form domains aligned in the $-z$ direction (Fig. 2*b*). This solution (type 1B) is a five-domain grain, having four domains in the $-z$ direction at the cube edges and a core domain in the $+z$ direction.

A classical two-domain grain (type 2 solution) can also be generated (Fig. 2*c*) which has a lower energy than the single-domain or five-domain solutions in the grain size range 0.096–0.35 μm. Thus the critical single-domain size d_0 in magnetite is ~0.1 μm, as predicted by one-dimensional theories[8,10,15,18], and the equilibrium structure above d_0 is a two-domain state with large closure domains and zero net moment. The solution (type 3) that is energetically the most favourable above ~0.35 μm is shown in Fig. 2*d*; this also a five-domain grain but is characterized by curling of the magnetization throughout the body of the grain.

The energies of these structures are between 2 and 3 times lower than those of one-dimensional solutions in the same grain-size range. This reduction in energy is due to the fact that the spins are free to rotate and thus to reduce the surface magnetic poles. A similar reduction of the surface-pole density was noted by LaBonte[6] for two-dimensional solutions of 180° domain walls in thin films. The net effect is that spins near the

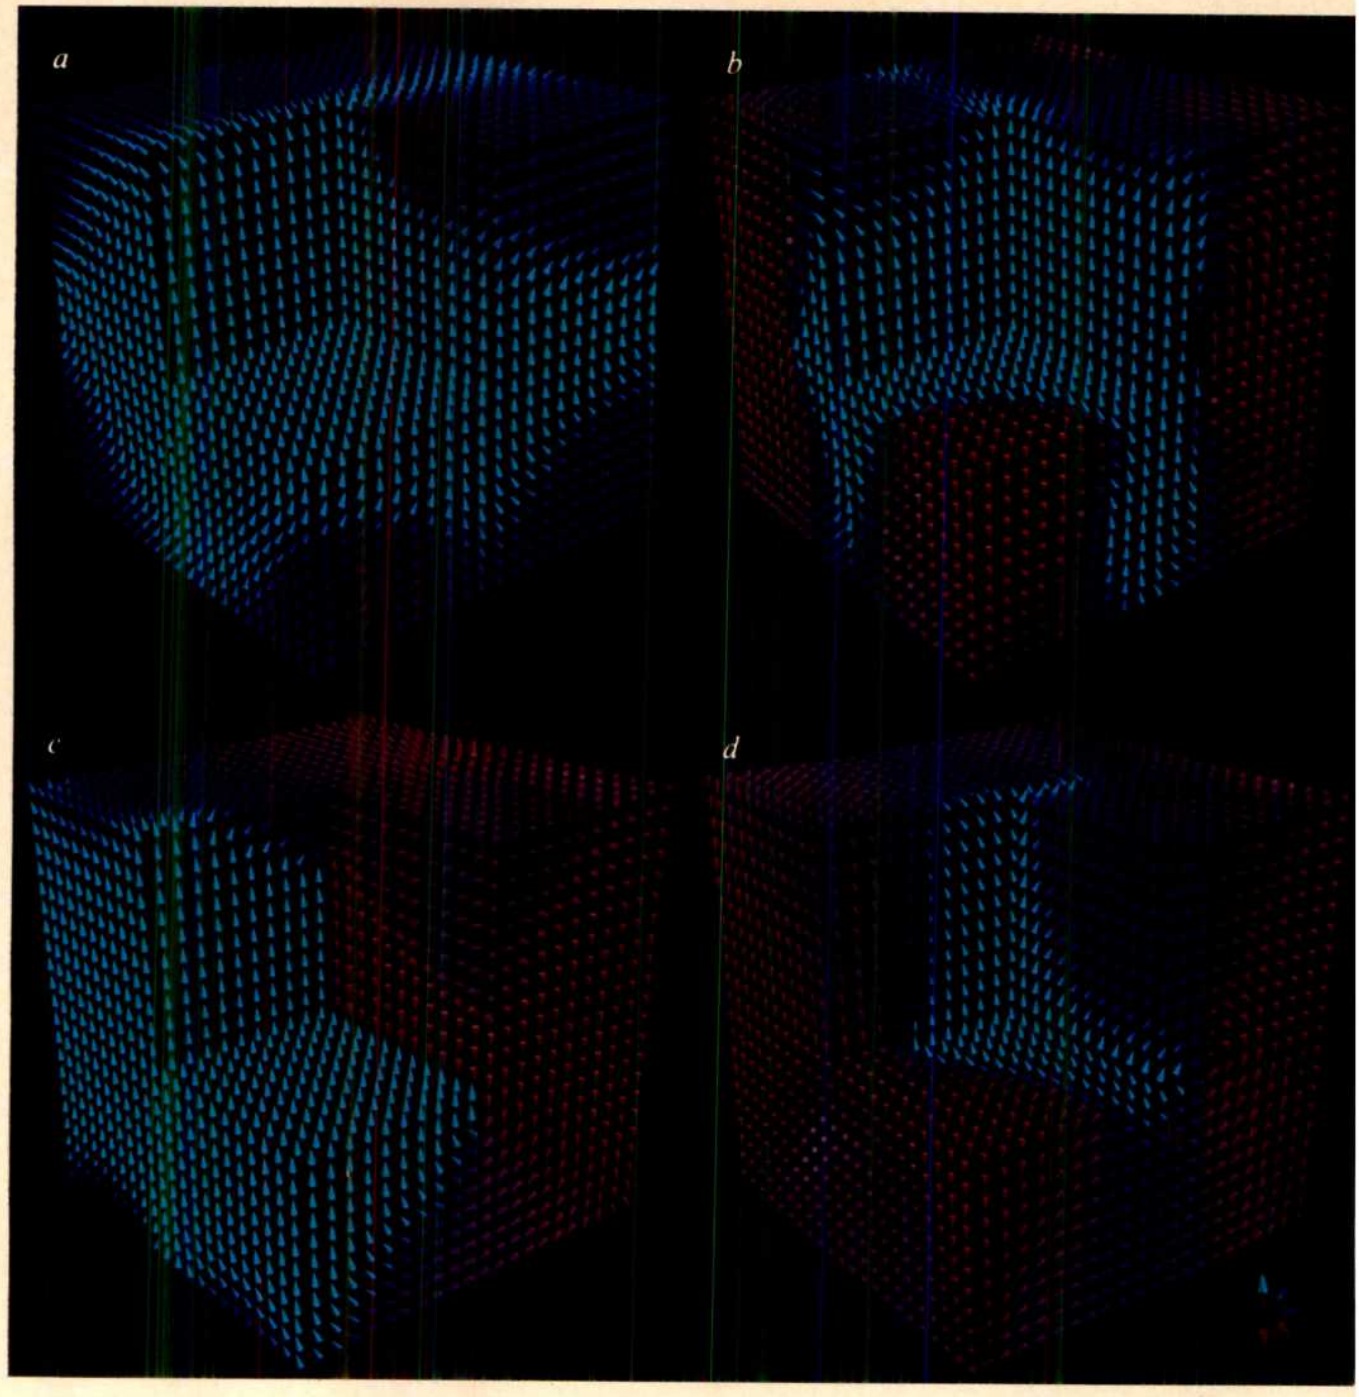

Fig. 2 Various types of symmetric solutions for 0.2 μm cube grain size. The solid cones representing the magnetic dipoles are coloured according to their angle from the vertical: light blue represents up and dark red represents down. *a*, A single-domain structure (type 1A), showing deflection of the magnetization at the cube corners. Reduced energy = 0.81; $M_{rs}/M_s = 0.89$. *b*, A five-domain structure (type 1B), obtained using the same symmetry as that of type 1A. Reduced energy = 0.78; $M_{rs}/M_s = 0.32$. *c*, A two-domain structure (type 2), with large closure domains. Reduced energy = 0.39; $M_{rs}/M_s = 0.0$. *d*, A five-domain structure (type 3) dominated by internal flux loops. Reduced energy = 0.50; $M_{rs}/M_s = 0.12$.

grain surface tend to lie parallel to the surface, so that Néel walls are favoured over Bloch walls, in which spins rotate in a plane perpendicular to the surface. Where Bloch walls do occur, as on the side faces of Fig. 2*b*, they are much narrower than predicted by one-dimensional models. Therefore Bloch walls themselves will not contribute significantly to the net magnetic moment of the grain.

We can compare our predictions of magnetic moments and Bitter patterns with experimental observations. Saturation remanence (M_{rs}) is a bulk magnetic parameter which has been measured for well-sized dispersed magnetite grains. It is likely that all the different domain configurations that are possible in a grain of a particular size will coexist and contribute to M_{rs}. Assuming equipartition of the permitted symmetric states, we predict the grain-size dependence of the reduced saturation remanence M_{rs}/M_s plotted in Fig. 3. A factor of 0.5 has been incorporated in the theoretical curve to allow for random orientations. This value is appropriate for crystals dominated by uniaxial shape anisotropy, as has shown to be the case[19,20] for many of the samples whose data appear in Fig. 3. There is good agreement with the published experimental data over the range 0.08–0.5 μm.

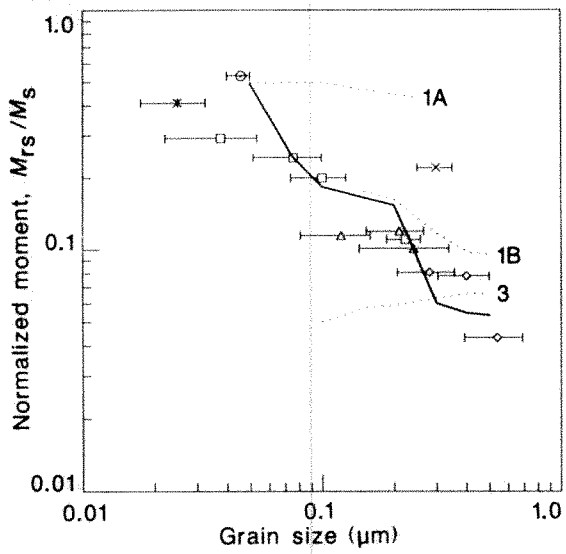

Fig. 3 Predicted grain-size dependence of reduced saturation remanence M_{rs}/M_s (solid curve) compared with experimental data. The dotted curves are the theoretical predicted values for the different structures shown in Fig. 2. Note that the two-domain structure (type 2) has zero net moment. The experimental data were obtained from: △ Levi and Merrill[20], □ Dunlop[21], * Özdemir and Banerjee[22], × Schmidbauer and Veitch[23], ⊙ Moskowitz *et al.*[24] and ◇ Dunlop and Argyle[25].

Bitter colloid patterns form in response to the magnetic field gradient normal to the surface of a grain. Because Néel walls do not generate large normal field gradients, even quite complex structures, such as that of Fig. 2*d*, might not be imaged by the Bitter technique, so that such a grain might be interpreted as comprising a single domain.

The results obtained so far show good agreement with bulk measurements of M_{rs}. Unfortunately we lack the experimental observations of Bitter patterns on submicrometre grains that are needed to test our predicted structures more rigorously. However, testable predictions of temperature and field dependencies of these structures are currently being investigated.

We thank the Ontario Centre for Large Scale Computation, particularly Dr Nina Bregman, James Rowell and Anna Pezacki for their help. We also thank Randy Enkin, whose work on one-dimensional modelling stimulated this study, and Shiu-Hong Lui for his efforts in coding much of the computer program. This work was supported by an operating grant from NSERC of Canada.

Sensitivity of climate and atmospheric CO_2 to deep-ocean and shallow-ocean carbonate burial

Tyler Volk

Earth Systems Group, Department of Applied Science, New York University, New York 10003, USA

Previous models of physical and biogeochemical controls of the evolution of atmospheric CO_2 and climate over hundreds of millions of years have neglected the effect of variations in the balance between shallow-ocean and deep-ocean carbonate deposition. This is important because the relative proportions of carbonate burial in the two reservoirs have changed over time. Here I set up a model of the carbonate–silicate geochemical cycle that distinguishes carbonate masses produced by the two types of burial and shows that reasonable increases in deep-ocean burial could produce substantial warmings over a few hundred million years. The model includes exchanges between crust and mantle; transients from burial shifts are found to be sensitive to the fraction of non-degassed carbonates subducted into the mantle. Without the habitation of the open ocean by plankton such as foraminifera and coccolithophores, today's climate would be substantially colder.

Over geological timescales, atmospheric CO_2 (P_{atm}), and therefore global temperature (T), is controlled by differing balances of sources and sinks[1–7]. Models have examined, in varying degrees of detail, forcings upon and changes in these source and sink terms, including net organic-carbon burial[3], sea-floor generation rate and continental area[2,3], P_{atm} and T feedbacks in the weathering sink[1,2,5] (the chemical weathering of continental silicates, followed by carbonate burial), and the effect of the terrestrial biosphere[5,6]. Until now, models of the geochemical carbonate–silicate cycle that explicitly calculated P_{atm} have failed to resolve the different dynamics of pelagic and continental carbonates. The relative proportions of carbonate entering these two reservoirs have changed over time[8,9], and there is strong evidence that the proportion of pelagic burial has increased substantially since the middle Jurassic[9–11].

A fundamental division of carbonates into those deposited in shallow water and those deposited in deep water is required to examine how their different dynamics could affect atmospheric CO_2, primarily because, mass for mass, the metamorphic flux of CO_2 to the atmosphere is much larger from pelagic than from continental carbonates. Burial in shallow water produces carbonates that will eventually be weathered or degassed on the continents; these continental carbonates decay statistically at a rate that is slower by an order of magnitude than that of the pelagic carbonates[9]. Burial in deep water produces pelagic carbonates whose sink consists of the subducting slabs at plate boundaries[12]. There, under conditions of higher heat and pressure, they may either be metamorphosed to silicates, accompanied by outgassing of CO_2 which eventually enters the atmosphere, or remain as carbonates on the slabs as they are subducted into the mantle[13]. The cycle of carbon between the mantle and crust has been shown to be important in the geochemical carbon cycle[12–14], but has not yet been incorporated explicitly into models for P_{atm}.

Our model for P_{atm} and masses of continental (M_c) and pelagic (M_p) carbonates is illustrated in Fig. 1, with interconnecting fluxes of carbon, F. Because the organic-carbon cycle is of only secondary importance[3], the only sink for P_{atm} considered here is that associated with silicate weathering (F_{sw}). The weathering fluxes—F_{sw} and that from the continental carbonates, F_{cw}—are derived from their present-day values ($F_{sw,ref}$ and $F_{cw,ref}$) using a non-dimensional weathering-rate factor $f_{wr}(T)$ (ref. 2). The temperature dependence of f_{wr} (equation 2) incorporates effects directly related to T as well as the effect of

temperature on global runoff; other forms for weathering are available[1,5], but would not essentially alter the conclusions. As in ref. 2, the weathering formulations assume that silicate weathering is unlimited, but that M_c affects carbonate weathering (see equations 1a, b). A greenhouse equation[2] relates P_{atm} and T (equation 3). Metamorphic release of CO_2 from continental carbonates is assumed to be proportional to M_c, and for simplicity, the flux of pelagic carbonates entering the subduction zones is also assumed to be proportional to M_p, as in ref. 9 (equations 4a, b). In reality, there is a varying delay during spreading between carbonate deposition above the carbonate compensation depth on the ridges and its subduction several tens of millions of years later. This delay is neglected here as we are concerned only with the fundamental dynamics of the system. Therefore, our equations are

$$F_{sw} = F_{sw,ref} f_{wr} \quad ; \quad F_{cw} = F_{cw,ref} f_{wr} \frac{M_c}{M_{c,ref}} \qquad (1a, b)$$

$$f_{wr} = 1.0 + 8.7 \times 10^{-2}(T - T_{ref}) + 1.9 \times 10^{-3}(T - T_{ref})^2 \qquad (2)$$

$$T - T_{ref} = 2.88 \ln\left(\frac{P_{atm}}{P_{atm,ref}}\right) \qquad (3)$$

$$F_{cm} = k_{cm} M_c \quad ; \quad F_{sub} = k_{sub} M_p \qquad (4a, b)$$

We introduce a burial parameter β ($0 \le \beta \le 1$), representing the way in which physical and biogeochemical ocean processes proportionate the weathering fluxes between the pelagic carbonates, $\beta(F_{sw} + F_{cw})$, and the continental carbonates, $(1-\beta) \times (F_{sw} + F_{cw})$. Abiotic carbonate precipitation in the hydrothermal cooling systems of mid-ocean ridges[15] could also be considered to contribute to β. The parameter β is obviously the same for both silicate and carbonate weathering, because precipitation does not distinguish calcium ions derived from different rock types.

The subduction flux, F_{sub}, is divided, using a subduction parameter $\sigma (0 \le \sigma \le 1)$, into a flux entering the mantle, σF_{sub} and a flux representing metamorphic decarbonation $(1-\sigma)F_{sub}$, which produces a source flux of CO_2 to the atmosphere. Transfer from M_p to M_c during lateral accretion of pelagic sediments to a continent at a convergent plate boundary is assumed to be negligible in this context. Finally, the flux of outgassed CO_2 from the mantle entering the atmosphere from the ocean ridges, F_r, is assumed to be constant. The governing equations for the three reservoirs are then:

$$\text{for } M_c: \quad \frac{dM_c}{dt} = (1-\beta)F_{sw} - \beta F_{cw} - F_{cm} \qquad (5)$$

$$\text{for } M_p: \quad \frac{dM_p}{dt} = \beta(F_{sw} + F_{cw}) - F_{sub} \qquad (6)$$

$$\text{for } P_{atm}: \quad F_r + F_{cm} + (1-\sigma)F_{sub} - F_{sw} = 0 \qquad (7)$$

which control M_c, M_p and P_{atm} respectively. A steady-state balance for P_{atm} must be maintained in the ocean/atmosphere system at all times over the timescales in this problem[1,2,5,7], even though P_{atm} varies with time in the longer term.

Figure 2 shows the results of perturbing an initial steady-state. The initial values are broadly consistent with the relationships in refs 2, 9, and 13 (see figure caption). This state is supposed to represent neither the present, although it draws upon many of the relationships that exist therein, nor any particular point in the past. Rather, it serves as a generic condition from which to study the response-dynamics of the system.

We introduce a step increase to β, $\Delta\beta$, at time $t = 0$. In Fig. 2, a trio of runs with $\Delta\beta = 0.1$, 0.3 and 0.5 shows that global warming follows the step increase to a degree that increases with larger $\Delta\beta$. For all of these cases, which have $\sigma = 0.5$ (a possible upper bound[13]), T is nearly maximal between 100 and 200 Myr after the β-step. The peak warmings for the three cases,

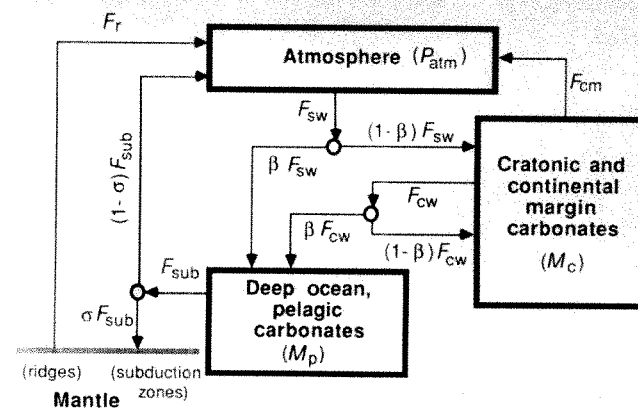

Fig. 1 Flows of carbon between reservoirs. The weathering fluxes associated with the weathering of silicates (F_{sw}) and continental carbonates (F_{cw}) are diverted by a burial parameter (β), which represents the degree to which physical and biological ocean processes deposit the carbon as carbonates either in shallow water, to become continental carbonates, or in deep water, as pelagic carbonates. The subduction flux (F_{sub}) either enters the mantle as carbonate or is metamorphosed, accompanied by CO_2 degassing into the atmosphere; this division is quantified with a subduction parameter (σ). The model also incorporates CO_2 fluxes to the atmosphere from the ocean ridges (F_r) and from continental metamorphism (F_{cm}).

respectively, are 2, 6 and 11 °C, and are followed by much slower cooling. These two trends—warming followed by cooling—derive from different rates of equilibration between sub-systems. In general, following the β-step, the increased burial flux to the deep ocean increases the pelagic carbonate mass, which increases CO_2 input to the atmosphere. Because of their relatively large mass, a decrease of only a few per cent in the mass of the continental carbonates causes a proportionately much larger increase to the pelagics. Over longer times, adjustment occurs between the total crustal carbonate system and the mantle, as the masses of both continental and pelagic carbonates decrease. In Fig. 2, as the pelagic mass declines, so does the metamorphic source flux of CO_2 to the atmosphere, hence giving rise to cooling. Note that the system is out of equilibrium for the Phanerozoic-length period of time shown in Fig. 2.

Because the present-day subduction efficiency σ is not well constrained (lying between 0 and 0.5 (ref. 13)), we have also examined the effect of varying this parameter. Using one case from the first trio of runs as a reference ($\Delta\beta = 0.1$, $\sigma = 0.5$), σ is decreased to 0.3 and 0.1. For a fixed $\Delta\beta$, a smaller σ gives a larger rate of warming, a larger peak ΔT and a longer time to reach the peak ΔT. For example, ΔT rises to ~8 °C by 400–500 Myr after the β-step, for $\sigma = 0.1$. This sensitivity arises because a smaller σ means that a higher metamorphic source flux of CO_2 to the atmosphere from the subduction zones is maintained for a given mass of pelagic carbonate. Figure 2 shows that substantial climatic changes follow even small shifts in β if σ is small, and also occur with larger values of σ if the shifts in β are larger.

The main objective of this study is to point out that partitioning of ocean carbonate burial must be incorporated in studies of the evolution of atmospheric CO_2 and climate. Evolutionary changes, such as the proliferation of coccolithophores after the Triassic and of globigerinacean foraminifera after the late Jurassic, shifted a significant portion of global carbonate deposition from the shelves to the deep ocean[8]. Wilkinson and Walker[9] propose that a gradual shift in β from about 0 to 0.6 has occurred over the past 140 Myr. (β might never have been zero, for hydrothermally induced carbonate precipitation at ocean ridges[15] may prevent β from falling below a certain minimum value. Also, even in the absence of $CaCO_3$-precipitating organisms in the open ocean, abiotic deep-ocean precipitation would have been required to maintain chemical balance if sea level

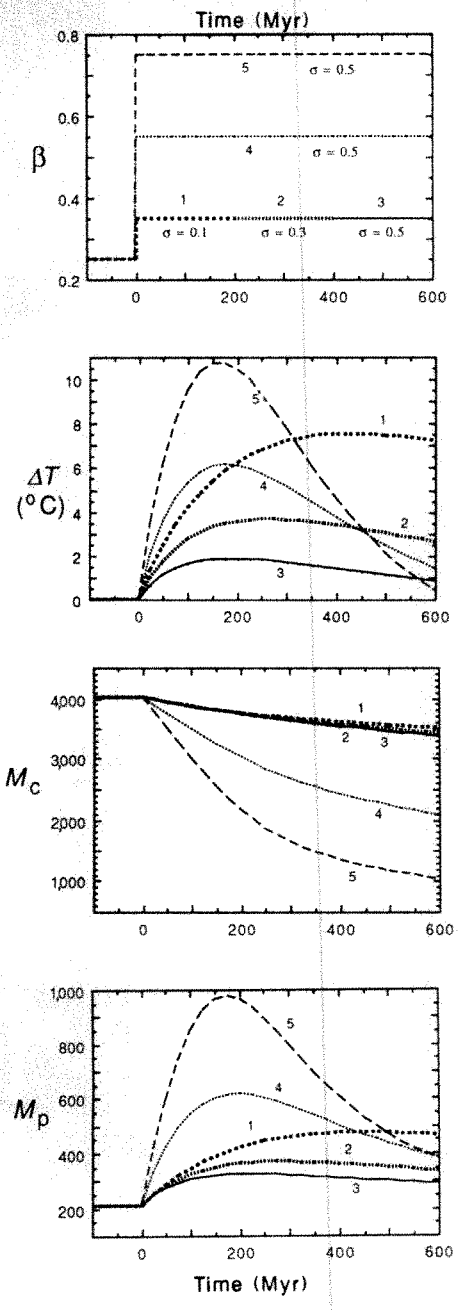

Fig. 2 Results of model runs, demonstrating the effect of a step increase, $\Delta\beta$, in the burial parameter β, for $\Delta\beta = 0.1$, 0.3 and 0.5 (cases 5, 4 and 3, with the subduction parameter $\sigma = 0.5$). To demonstrate sensitivity to σ, cases 3, 2 and 1 have $\sigma = 0.5$, 0.3 and 0.1, respectively, each with $\Delta\beta = 0.1$. All cases have identical initial values for β, T, M_c and M_p, and are initially in steady-state. These identical initial values can be set for different values of σ by varying F_r to satisfy $F_r = \sigma F_{sub}$, with F_{sub} taking the value for a steady-state solution with $\sigma = 0$. To satisfy the equations described in the text, the system requires reference values. We use those in ref. 2: $F_{sw,ref} = 9 \times 10^{18}$ mol myr^{-1}; $F_{cw,ref} = 12.5 \times 10^{18}$ mol myr^{-1}; $M_{c,ref} = 4{,}000 \times 10^{18}$ mol; $T_{ref} = 15$ °C; $P_{atm,ref} = 310$ μatm. Following ref. 9, $k_{sub} = 0.022$ myr^{-1} (approximately the inverse of the average age of ocean floor[19]). The value for k_{cm} is chosen such that $k_{cm} \ll k_{sub}$ and k_{cm} is less than the weathering rate constant of continental carbonates (~0.002 myr^{-1} in ref. 9) but is not negligible; we use $k_{cm} = 0.0005$ myr^{-1}. Somewhat arbitrarily setting $\beta = 0.25$ for the initial steady-state gives a reasonable crust and mantle silicate-carbonate cycle for perturbation studies, specifically, initial conditions of $M_c = 4{,}020 \times 10^{18}$ mol; $M_p = 210 \times 10^{18}$ mol (for present-day values[10], $M_p < 0.1$ M_c); $P_{atm} = 380$ μatm; $T = 15.6$ °C; $F_{cm} = 5.0 \times 10^{18}$ mol myr^{-1}; $F_{cw} = 10.6 \times 10^{18}$ mol myr^{-1}; $F_{sw} = 9.2 \times 10^{18}$ mol myr^{-1}; $F_{sub} = 4.1 \times 10^{18}$ mol myr^{-1}. The temperature is scaled such that $\Delta T = T - 15.6$ °C. For $\sigma = 0.5$, 0.3 and 0.1, respectively, $F_r = 2.1$, 1.3 and 0.4×10^{18} mol myr^{-1}. These values for F_r are within the lower end of the range estimated by ref. 13, and are reasonable in view of the fact that a steady-state atmosphere/ocean system requires $F_r < F_{sw}$. The system uses a fourth-order Runge–Kutta scheme[20] with time steps of 1 Myr; here time is scaled such that the step increase in β occurs at $t = 0$.

was below the shelf.) Wilkinson and Walker attributed this shift to ecological changes, as have others, but also made a strong case for the alternative of linking β directly to sea level as a result of changes in the area of shallow epicontinental seas. Because β could decrease as sea level rises and vice versa, falling sea level during the past 100 Myr could explain an increase in β. But regardless of the cause, such an increase in β over the past 100 Myr is widely accepted[9–11]. According to Fig. 2, shifts in β of this magnitude should now be affecting the Earth's carbonate–silicate cycle, atmospheric CO_2 and climate.

The value of the subduction parameter σ is highly uncertain. Within our model, the peak of 11 °C in the time history of ΔT with $\Delta B = 0.5$ and $\sigma = 0.5$ is moderated to ~4 °C for $\sigma = 0.7$ and to ~1 °C for $\sigma = 0.9$. Thus substantial forcing towards warming over this 100–200-Myr period is indicated if σ is less than about 0.7. An estimate[13] for σ of between about 0 and 0.5 thus supports such a forcing, but the steady-state assumption used for the present crust–mantle exchange must be treated with caution in view of the possibility of transients as demonstrated here. There is evidence for CO_2 degassing in areas of magmatic and metamorphic activity associated with plate boundaries[2]. Metamorphism of carbonates on subducting slabs is probably the principal source of such outgassing (R. Berner, personal communication). More study of the geochemistry of subducting slabs and the outgassing of CO_2 is required, but it appears quite likely that our present carbon cycle is in a transient resulting from an increase in β.

In reality, cooling has occurred during the past 100 Myr (ref. 16). A decrease in the rate of sea-floor generation and an increase in weathering from the increase in continental area have caused a lower degree of degassing, resulting in a forcing towards cooling of 5–12 °C (refs 2, 3, 5). This could have been balanced by a roughly concurrent forcing-towards-warming, apparent here as an increase in β. But if another, independent, forcing-toward-cooling of about the same absolute magnitude arose from the evolution of angiosperm-deciduous ecosystems[6], the result could have been the net cooling observed. Shifts in continental positions are an additional contributory factor to the observed cooling[17]. In any case, it is likely that the persistence in the recent past of substantial deep-ocean carbonate burial, considered as an isolated effect, is a warming factor today. Given the close relationship in the glacial/interglacial cycle between climate and CO_2 (ref. 18), the substantial deposits of carbonates on the subducting slabs may be contributing to atmospheric CO_2 sufficiently to avoid continuous glacial conditions on the Earth.

I thank D. D. Marais, J. Kasting and S. Richardson for participating in early probes into these ideas; K. Caldeira, M. Rampino and R. Beerner for discussions; L. Kump for comments on the manuscript; and B. Wilkinson and J. Walker for a preprint. Research support provided by NASA.

Implosive earthquakes at the active accretionary plate boundary in northern Iceland

G. R. Foulger*, R. E. Long*, P. Einarsson† & A. Bjornsson‡

Non-double-couple earthquake focal mechanisms imply a mode of seismic failure other than simple shear, and movements perpendicular to the fault plane. Reports of such events are rare and it is controversial whether such failure can occur at depth in the Earth. Following reports of such earthquakes from the Hengill and Reykjanes volcanic systems on the accretionary plate boundary in Iceland[1–3], a seismological survey was conducted in the Krafla system, Iceland, to explore whether such earthquakes occur elsewhere along the boundary. Here we report the observation of a mixed suite of focal mechanisms at Krafla, including shear events, explosive tensile-crack events such as were observed at Hengill and Reykjanes, and implosive events. These last represent cavity collapse and constitute an entirely new class of earthquake. The Krafla system had undergone a crustal spreading episode[4–10] during the decade before the observations were made, and our results indicate that immediately after such an episode the accretionary plate boundary is characterized by a heterogeneous stress regime, with shear, extensional and compressional sources in close juxtaposition.

In 1985, the earthquake activity associated with the Krafla volcanic system, on the accretionary plate boundary in Iceland, was investigated with a 30-station, temporary seismometer network (Fig. 1). The impetus for this work came from recent, similar experiments in other parts of the spreading plate boundary in Iceland, where small earthquakes with non-double-couple focal mechanisms were discovered[1–3]. In the Hengill area (inset, Fig. 1), about half of the 178 events studied were of tensile-crack type, and at Reykjanes a few similar events were observed. One of the goals of the Krafla experiment was to test the hypothesis that such events characterize the spreading plate boundary in general.

Very accurate hypocentral locations were obtained for 100 small earthquakes ($-2.0 < M_l < 2.1$, where M_l is the coda duration magnitude, normalized to the surface wave magnitude M_s) in the depth range 1–4 km. 25 focal mechanisms were well constrained by P-wave first motions, of which 17 did not violate a double-couple, shear interpretation, three were non-double-couple, explosive, and fitted a tensile-crack interpretation similar to the Hengill and Reykjanes events[1–3], and five were non-double-couple and predominantly implosive. These latter events represent cavity collapse at depths of up to 3.5 km in the Earth's crust. This study provides further evidence for non-double-couple earthquakes. It also indicates an inhomogeneous stress field—in contrast to those from other volcanic systems on the accretionary plate boundary in Iceland, where relatively homogeneous stress fields were revealed[1–3]—and shows compressional phenomena occurring within a regional extensional environment.

The Krafla volcanic system is a segment of the neovolcanic zone in Iceland[11] (Fig. 1). It displays a fissure swarm and a central volcano with a caldera 10 × 7 km in size, underlain by a molten body in the depth range 3–7 km (ref. 4). Two separate geothermal areas lie within the system (Fig. 1). In 1975 the central volcano became active and triggered a spreading episode. For several years its magma chamber inflated continually at a rate of ~5 $m^3 s^{-1}$, and deflated rapidly at intervals of a few months[5–10]. Magma then escaped from the chamber and was intruded along the fissure swarm to form vertical dykes. Up to 8 m of spreading occurred, after which further intrusions could not be accommodated by the altered stress field, and surface magma eruptions occurred[10].

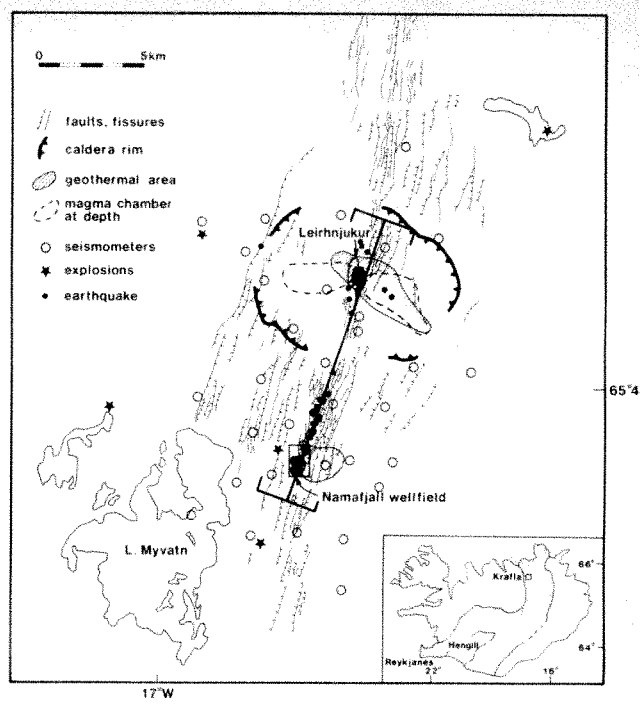

Fig. 1 Tectonic map of the Krafla area, the seismograph network and earthquake epicentres. The outlines of the magma chambers are taken from ref. 4. The bold line corresponds to the section of Fig. 2. Inset shows a map of Iceland. The neovolcanic zone, which marks the locus of the accretionary plate boundary, is shaded, and the locations of the Krafla, Hengill and Reykjanes areas are shown.

At the time of this experiment, the area was volcanically quiescent, and our aim was to study the continuous seismicity associated with the geothermal areas. The majority of earthquakes were located within these areas (Fig. 1) and activity was continuous on a daily basis. It extended to 4 km depth beneath the Namafjall geothermal area in the south, and 3 km depth beneath the Krafla geothermal area in the north (Fig. 2).

The majority of events beneath the Krafla area directly overlie the intersection of the molten body with the 2-km-wide central part of the fissure swarm where most of the spreading occurred[10]. The events form a zone dipping northerly at an angle of 45°, the surface projection of which lies close to the southern caldera fault (Fig. 2), where minor geothermal activity occurs.

Seismic activity within the Namafjall geothermal area clustered in a narrow 'chimney' 2–4 km deep, directly beneath a producing wellfield (Fig. 2). We conclude that these seismic events are induced by heat mining, and the seismically active volume indicates the extent of the cooling zone[2,3,12,13]. Of 20 well constrained focal mechanisms derived for this volume, 16 were predominantly of strike-slip double-couple type with variable orientations of the P and T axes (Fig. 3), and two were predominantly compressive and of tensile-crack type, similar to those observed at Hengill[2,3] and Reykjanes[1] (I and II, Fig. 4*a*). The crack orientation was NNW, oblique to the orientation of the rift zone. In addition, two focal mechanisms displayed

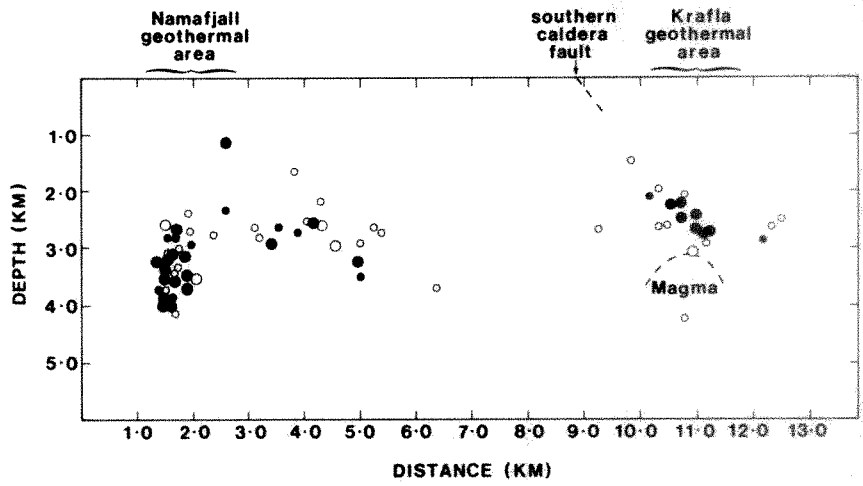

Fig. 2 SSW–NNE cross-section of the region of Fig. 1, showing hypocentral locations.

predominantly dilatational arrivals, and were therefore implosive and indicative of cavity collapse (III and IV, Fig. 4*a*). These results indicate that the seismic volume is deforming chaotically and that the stress field is inhomogenous, in contrast to the Hengill and Reykjanes volcanic systems, where all focal mechanisms were consistent with a uniform extensional stress field.

A third group of events occupy a NNE-trending zone at depths of 2–3.5 km, the locus of recent southerly dyke injections[7]. The four well constrained focal mechanisms obtained for this zone are all non-double-couple, one being of tensile-crack type (III, Fig. 4*b*) and three displaying cavity collapse (I, II and IV, Fig. 4*b*).

Reports of non-double-couple earthquake radiation patterns are rare, so that these data must be examined critically. The P waves were impulsive and did not have the emergent character sometimes observed in volcanic regions, and the seismometer polarities were tested using both explosions and teleseisms. Thus the polarities of the data points presented in Fig. 4 are reliable. Distortion of the ray paths by crustal heterogeneity was ruled out by the refraction-shot data, which showed that the crust is laterally homogeneous to within 5% of the average one-dimensional crustal model used for locating the hypocentres. In addition, the non-double-couple events occurred in the same volume as double-couple events. These factors rule out all explanations, other than non-double-couple source processes, for our observations.

In this spreading environment it is to be expected that the collapsing cavities are cracks orientated parallel to the fissure swarm. The expected radiation pattern of such an event would be omni-dilatational[14]. All events show one or more compressions, however, and in Fig. 4 we show suggested positions for small circular nodal lines that do not violate the data. The seismic moment density tensors of the dilatational events range from $[-1, -1, 0.7]$ to $[-1, -1, 0.3]$. Such sources imply cavity collapse along the edges of the cracks. The event shown in Fig. 4*b*(II) could be fitted only by small circular nodal lines, with the compressive field forming the continuous belt, and such a source represents crack closure. By analogy with source mechanisms that have been proposed to explain the tensile-crack radiation patterns[2,3], the compressive component might be explained by an increase in pore pressure in the crack at the instant of collapse. Such a mechanism would generate small circular nodal lines. An alternative explanation for the compressive field is that it may be generated by a shear component of movement in the source mechanism, in which case the nodal lines would not be small circles.

The non-double-couple events do not exceed magnitudes of $M_L = 0.7$, whereas the double-couple events range in magnitude up to $M_L = 2.1$. The very close correlation of the earthquakes with surface heat loss, and analogies drawn with the Hengill area, are convincing evidence that these events are induced by thermal cracking[2,3,12,13]. The total volumetric component of the earthquakes may be calculated, and compared with the volume contraction resulting from heat loss[2,3]. It is found that the seismic volumetric component is two orders of magnitude smaller than the cooling volumetric component. This result indicates that the majority of the volume contraction resulting from the surface heat loss is accommodated aseismically, a conclusion also reached for the Hengill geothermal area.

The volumetric contraction resulting from surface heat loss reduces the confining stress in the geothermal heat source. In many geothermal areas, this results in continuous, small-magnitude earthquake activity that releases stress in accordance with the regional field[2,3,15–18]. It is to be expected that at the accretionary plate boundary this stress field is uniform and extensional, and that tensile-crack opening occurs[2,3]. This is observed at Hengill[2,3] and Reykjanes[1]. The heterogeneous suite observed at Krafla contrasts with this, probably because of the recent spreading episode, which released the extensional stress field. No such rifting or volcanism is reported for the Hengill and Reykjanes areas for 200 and 700 yr respectively[19,20].

The observations from the Krafla volcanic system provide further evidence that small-magnitude non-double-couple seismic failure characterizes the accretionary plate boundary in

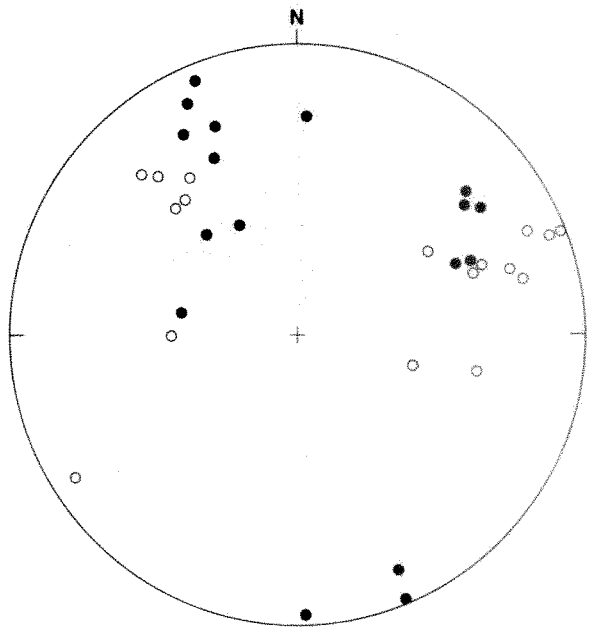

Fig. 3 Stereographic plot of the pressure (○) and tension (●) axes of the double-couple events. These are related to (though not equivalent to) the axes of greatest and least principal stress respectively.

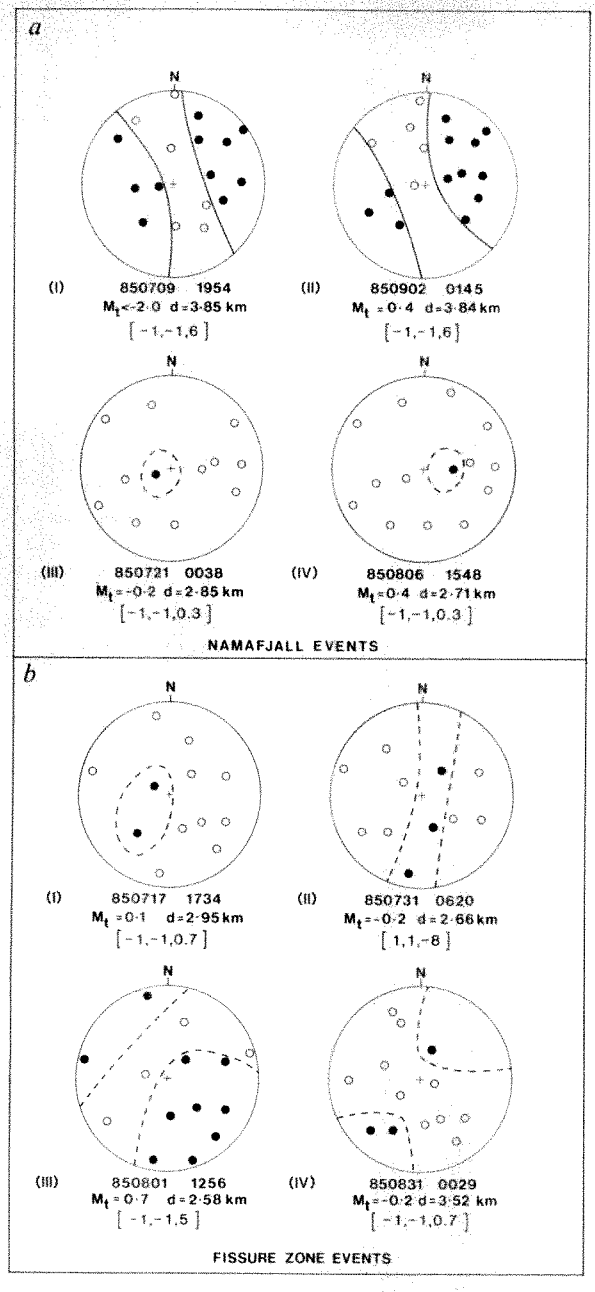

Fig. 4 Non-double-couple focal mechanisms obtained for events beneath the Namafjall geothermal area and along the fissure zone. Filled circles indicate compressions and open circles indicate dilatations. These are upper focal-sphere plots in stereographic projection. Dashed lines are suggested positions of small circular nodal lines. Event captions indicate origin time, local magnitude (M_L), depth (d) and approximate seismic moment density tensor.

Iceland. The Hengill and Reykjanes observations show that an extensional-stress regime may develop during long periods of quiescence between spreading episodes, and that both double-couple and non-double-couple extensional seismic failure occurs. In contrast, the Krafla observations indicate that the immediate post-spreading phase in the accretionary tectonic cycle is characterized by a chaotic stress field, with double-couple events of variable orientation, and both extensional and compressional non-double-couple sources in close juxtaposition.

This project was financed by the Natural Environmental Research Council (who also lent Geostore field-recording equipment), the National Energy Authority, Iceland, and a grant from the Icelandic Science Fund to the Science Institute, University of Iceland. Larus Bjarnason, Bob Jones, Mike Smith and Dave Stevenson gave invaluable assistance. Roger Bilham improved the manuscript.

Latest Proterozoic plankton from the Amadeus Basin in central Australia

W. L. Zang*† & M. R. Walter‡

* Department of Geology, Australian National University, PO Box 4, Canberra, Australia 2601
‡ Division of Continental Geology, Bureau of Mineral Resources, Geology and Geophysics, PO Box 378, Canberra, Australia 2601

The plankton of the Proterozoic is preserved mainly as microfossils known as acritarchs, most of which are considered to be cysts of eukaryotic algae. In recent studies of the diversity of Proterozoic and early Palaeozoic acritarchs, a gradual increase in diversity from the Middle into the Late Proterozoic has been shown to be followed by a sharp decrease in diversity in the latest Proterozoic (Ediacarian or Vendian) and then a rise again in the Early Cambrian[1,2]. These observations have been interpreted in terms of the evolutionary diversification of eukaryotic algae and the ecological effects of the pre-Ediacarian glaciation. Occasional discoveries of complex acritarchs in Ediacarian rocks[3-6] have raised some doubts about these interpretations, but more recent work seems to have supported this view[7]. Here we report the discovery of a diverse assemblage of large and morphologically complex acritarchs from the Ediacarian age upper Pertatataka Formation in the Amadeus Basin of central Australia. This, with a recent report of similar fossils from the upper Sinian of China[8], provides a significant new perspective on the history of the plankton. It is now necessary to suggest an earlier radiation, at least in off-shore environments, or to question the reality of the postulated decrease in diversity. In addition, there may well have been an extinction event, late in the Ediacarian. Neither of these phenomena has been recognized previously.

The Amadeus Basin is intracratonic (Fig. 1) and has a sediment fill ranging in age from about 800-900 Myr BP to late Palaeozoic. Dykes in the basement are unconformably overlain by the basal sandstone of the basin and are dated (Rb/Sr on separated minerals) at 897 ± 9 Myr BP providing a maximum age for the sedimentary sequence[9]. The Pertatataka Formation overlies the upper of two Proterozoic glacial sequences and underlies the Arumbera Sandstone which in its lower part contains fossils of the soft-bodied Ediacara fauna (Fig. 2). The upper Arumbera Sandstone contains abundant and diverse trace

† Present address: Institute of Geology and Palaeontology, Nanjing, People's Republic of China.

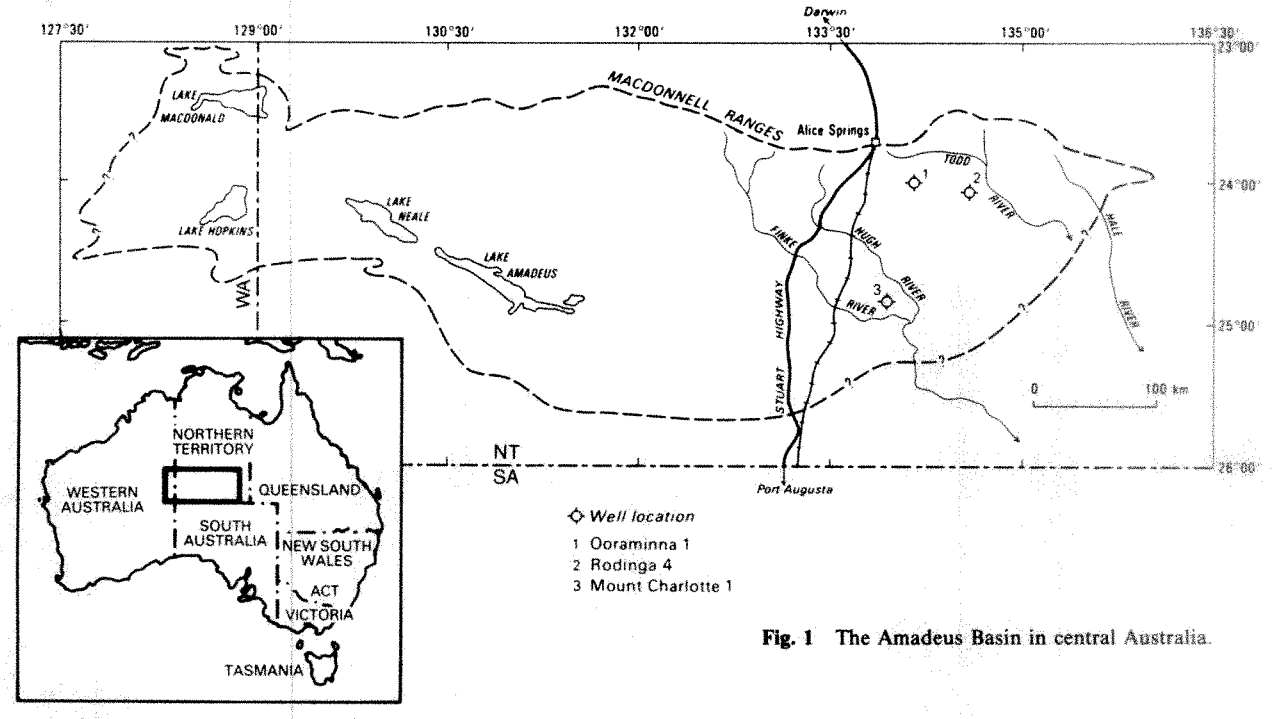

Fig. 1 The Amadeus Basin in central Australia.

fossils like those in Early Cambrian rocks world-wide[10,11], and it in turn is overlain by a carbonate with small shelly fossils of Atdabanian (mid Early Cambrian) or slightly greater age[12]. We can be confident that the Pertatataka Formation is Late Proterozoic, and lithostratigraphic correlations with the nearby Adelaide Geosyncline establish an Ediacarian age[13,14].

The Pertatataka Formation is poorly exposed and for this and other reasons has been little studied, but recent work shows it to be a sequence of distal turbidites. It is made up primarily of red and green shales and siltstones, with minor, thin sandstone beds. The lack of conglomerate and coarse-grained channel sands, the preponderance of base cut-out sequences and the fact that the coarsest grain size is fine sand, are considered to indicate that the turbidites were deposited in an outer submarine fan to basin plain environment[15]. The material used in this study came from oil exploration and stratigraphic drill-holes Ooraminna number 1, Rodinga number 4 and Mt Charlotte number 1 (Fig. 1). We have studied about 40 samples from a stratigraphic interval of 140 m in Rodinga number 4, six samples from Ooraminna number 1 and five samples from Mt Charlotte number 1. The diverse assemblage is restricted to the upper part of the Pertatataka Formation, which occurs in only the first two of these drill holes.

The lower Pertatataka Formation contains what could until now have been regarded as a typical Ediacarian assemblage of acritarchs, consisting of 13 taxa of simple spheroidal forms (the number of taxa must be considered tentative until the taxonomic systematics of this assemblage has been published). The assemblage is not known to include any spinose acritarchs. The spheroidal forms include common species of *Trachysphaeridium*, *Kildinosphaera*, *Protoleiosphaeridium*, *Stictosphaeridium* and *Leiosphaeridia*, as well as some new species. Examples of *Kildinosphaera* are particularly abundant. One sample has very abundant examples of acritarchs comparable to *Bavlinella*, with growth sequences like those described for *Sphaerocongregus*[16].

Possibly as many as 40 species are recognizable in the upper Pertatataka assemblage (again, the number must be treated with caution at this stage). Many of the simple spheroidal forms found in the lower assemblage are also present here, and there are two distinctive new spheroidal forms. One has 12–20-μm cells inside an 80–200-μm-wide vesicle. A second has numerous cells within 150-μm-wide vesicles. Some well preserved filamentous microfossils have been found in samples from Rodinga number 4. Most are fragmentary and were probably transported from a nearshore environment. They are referable to well known taxa such as *Eomycetopsis*, *Siphonophycus*, *Oscillatoriopsis* and the helically coiled *Obruchevella*.

Of most interest are the large and lavishly ornamented forms (Fig. 3). These are abundant and contain more than 50% of all taxa recognizable in the younger assemblage. Most abundant is a form we identify as a new species of *Cymatiosphaeroides*, an acritarch with numerous thin spines between the main vesicle and an outer membrane. This form is about 180 μm wide. There are also large acritarchs (about 180 μm wide) with abundant hair-like spines up to 40 μm long, which we regard as a new species of *Comasphaeridium*. Next most abundant in the assem-

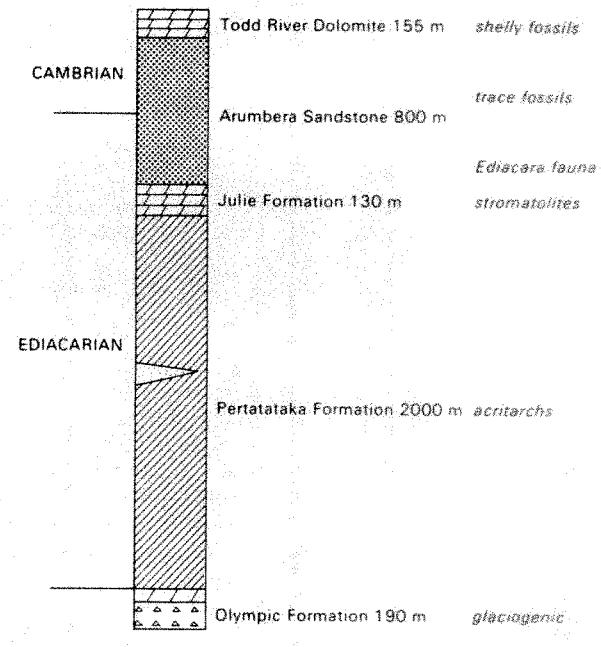

Fig. 2 Generalized stratigraphic section for the NE Amadeus Basin.

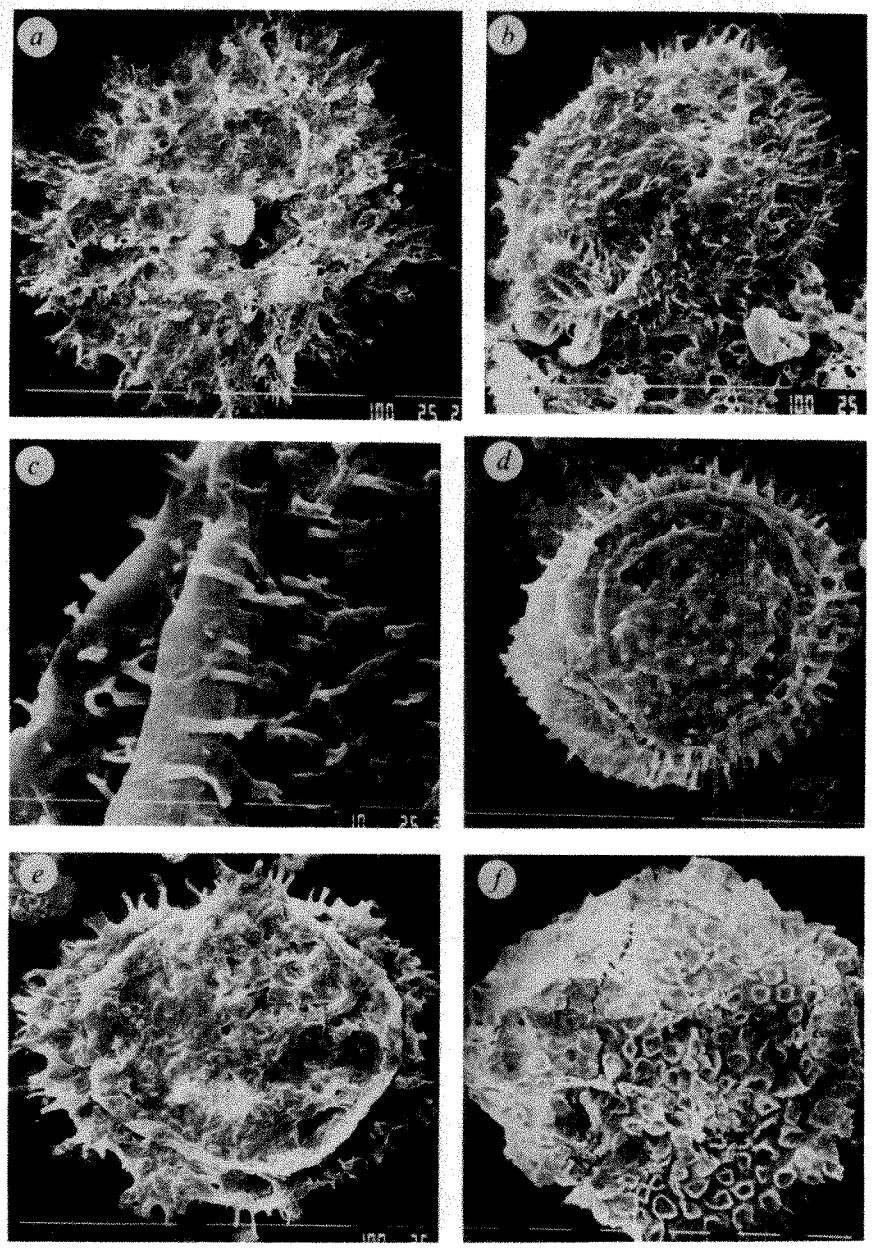

Fig. 3 Acritarchs from the Ediacarian Pertatataka Formation from the indicated depths in BMR drill hole Rodinga number 4 in the Amadeus Basin, central Australia. *a*, Large vesicle with frequently branched processes (34.50–34.76 m). *b*, *Trachyhystrichosphaera* (34–35 m). *c*, *Skiagia* (48.38–48.67 m). *d*, *Gorgonisphaeridium* (53.86–54.14 m). *e*, Unnamed form (52.16–52.50 m). *f*, Unnamed form bearing tube-like processes opening at the outer end but not communicating with interior of the vesicle (48.92–49.24 m). Scale bars, 100 μm for *a*, *b*, *d* and *e*, and 10 μm for *c* and *f*.

blage are very large vesicles with hollow spines; we tentatively identify these as new species of *Baltisphaeridium* and *Trachyhystrichosphaera*. There appear to be several different species present; one form has vesicles up to 240 μm in width and abundant broad-based spines up to 15 μm long. Another has vesicles about 100 μm wide with numerous slender, curved spines up to 40 μm long. Also present is a previously undescribed type of acritarch, with vesicles about 200 μm wide and with two kinds of spines, each confined to discrete areas of the vesicles: one kind is thick and isolated like those of *Baltisphaeridium*, the other thin and hair-like as in *Comasphaeridium*.

Other spinose acritarchs are much less common. Perhaps the most distinctive is a previously undescribed very large acritarch with a vesicle 400 μm wide and numerous thick frequently branched processes up to 60 μm long. Amongst the other spinose forms are some in which the spines have thickened tips, another with broad-based spines like those of *Comasphaeridium*, and a third with blunt-tipped spines. There is also a form with short, branched spines possibly referable to *Gorgonisphaeridium*. Acritarchs up to more than 300 μm wide with short, funnel-shaped processes that open into the vesicles are present in low abundance. We treat these as a new, very large species of the genus *Skiagia*. A rare and completely new form has vesicles 100 μm wide with short, broad, pipe-like processes (Fig. 3*f*).

Several of these genera have previously only been recognized in Cambrian and younger deposits[17–20], although the forms we have discovered are very much larger than their Palaeozoic equivalents. This assemblage is distinctive and different at least at the specific level from younger examples. It is a matter of taxonomic judgement as to whether to include these newly discovered very large acritarchs in genera previously defined for much smaller forms; we have chosen to do so because in all respects other than size our specimens fit the generic diagnoses. Some of the Pertatataka acritarchs also resemble large spinose forms such as *Cymatiosphaeroides* and *Trachyhystrichosphaera* that are rare components of older Late Proterozoic assemblages[21].

Many examples of Ediacarian acritarch assemblages have been described and almost without exception they consist of unornamented spheroidal forms (leiosphaerids) often accom-

panied by macroscopic algae (vendotaenids). A recently described example is that of the Arcoona Quartzite Member, a correlative on the Stuart Shelf of South Australia of the middle Pertatataka Formation of central Australia[7]. However, the new discoveries in the Doushantou Formation of the Yangtse Platform[6,8] and the upper Pertatataka Formation indicate that there was an assemblage of diverse and complex plankters at this time. We consider that there are at least two possible reasons why this assemblage has not been recognized previously: (1) it was not as readily preserved as older and younger assemblages; (2) it lived in an off-shore marine environment that is poorly represented in the Ediacarian geological record. Evidence for the first explanation is the preservation of the assemblage in cherts of the Doushantou Formation[6] but not in interbedded shales. Cherts are well known to be an exceptionally effective medium for the preservation of microfossils, but acritarchs are usually found in shales and siltstones as well as in cherts. Second, few turbidites of definite Ediacarian age seem to have been searched for acritarchs. 'Proterozoic sequences which have been micropalaeontologically investigated so far usually represent shallow marine depositional conditions'[1]. The environment of deposition of the Doushantou Formation is poorly known; pseudomorphs of gypsum are reported from dolomite in the lower part of the formation and ooids from the upper part, suggesting shallow water to emergent environments. The acritarchs come from cherts in flat-laminated silty dolomites in the middle part of the formation, which has been interpreted as having been deposited in a quiet, relatively deep marine environment[22]. The occurrences in the Pertatataka Formation might be the result of unique preservational circumstances, but they certainly suggest that more attention to turbidites is justified.

Previous authors have postulated a sharp decrease in the diversity of the plankton at the time of the widespread pre-Ediacarian glaciation, with no subsequent diversification until Early Cambrian times. It is now necessary to suggest an earlier radiation, at least in off-shore environments, or to question the reality of the postulated decrease in diversity. In addition, there may well have been an extinction event, late in the Ediacarian: the Ediacarian assemblage is very distinctive and different from all younger assemblages, even though we have chosen to place some of the new species in Palaeozoic genera. Many individual Ediacarian acritarchs are some two orders of magnitude greater in volume than comparable forms of Cambrian age. The Proterozoic history of the plankton is still very poorly known and caution is obviously necessary, but our observations do seem to indicate a previously unrecognized extinction event.

Evolution of seed dormancy

Gene Mapes*, Gar W. Rothwell* & M. T. Haworth†

* Department of Botany, and † Department of Zoological and Biomedical Science, Ohio University, Athens, Ohio 45701, USA

Palaeozoic fossil conifer cones bearing mature seeds with well developed cotyledonary embryos have been recovered from Permo-Carboniferous strata of North America. These are the most ancient embryos ever discovered within gymnosperm seeds[1,2]. In contrast to the pteridophytic ancestors of seed plants and other major groups of Palaeozoic gymnosperms[3,4], these embryos indicate that there was a significant delay between fertilization and seed germination in the earliest conifers. We suspect that this post-zygotic quiescence may be a first step in the evolution of seed dormancy.

Although gymnosperm ovules from Palaeozoic sediments sometimes contain well preserved gametophyte tissue[5,6], embryos are exceedingly rare[1,2]. Among the hypotheses attempting to account for the paucity of embryos are two that propose that the post-zygotic development in the earliest gymnosperms occurred as a rapid and continuous sequence[3,4]. Modern, and presumably ancient, pteridophytic reproduction is characterized by continuous development from spore germination through to fertilization, embryogeny and sporeling growth[7,8], but the embryos of most modern seed plants have a quiescent period before seed germination and seedling establishment. Moreover, many seeds remain dormant until a physical or physiological barrier has been overcome[9,10]. Dormancy is more common in flowering plants than in gymnosperms, but some degree of quiescence characterizes living seed plants in virtually all the main climatic zones[11–14]. Both mechanisms coordinate seed germination and seedling establishment with favourable environmental conditions.

This report of well developed embryos in Palaeozoic conifer seeds may provide evidence for the evolution of quiescence. The seeds are preserved within the cone of a walchian conifer (Fig. 1*a*) from limestone deposits of either the uppermost Pennsylvanian or lowermost Permian, near Hamilton, Kansas[15,16]. Mature ovules and seeds are 5.5–7 mm long with a well developed integument (Figs 1*a* and 2) and an open micropyle (Fig. 2). The nucellus is thin and contains a large megaspore membrane. Distally the nucellus forms a prominent pollen chamber with a differentiated apical beak (Fig. 2).

Among the 34 seeds present in the Hamilton cone there are cellular megagametophytes in six, and well developed embryos (Figs 1*b* and 2) in four. These numbers are consistent with the low percentage of mature seeds which typically develop in normal cones of modern conifers[17,18]. The fossil seeds show no evidence of larval or fungal damage, and their range of structural variation is consistent with normal developmental variation among healthy seeds of gymnosperms[19,20]. In the Hamilton seeds, cellular gametophyte tissue is preserved in the centre of the megaspore interior. It is unzoned and forms an elongated ellipse with an irregular periphery.

The most mature embryo (Figs 1*b* and 2) is about 2.5 mm long and slender. There are about six cotyledons surrounding the epicotyl, and they are tightly appressed to one another (Figs 1 *b* and 2). The radicle lies adjacent to the pollen chamber, with the cotyledons extending towards the chalaza (Fig. 2). Tracheid maturation is incomplete, but there is a slender zone differentiated at the centre of the embryo (Fig. 1*b*) that may represent procambium. As in modern conifer seeds, the embryo is separated from the gametophyte tissue by a narrow, well defined corrosion cavity (Fig. 1*b*). Large cells at the tip of the radicle seem to be similar to the suspensor tissue of extant conifer seeds[19].

These are the most ancient seeds known to contain cotyledonary embryos, and they are evidence that the embryogeny

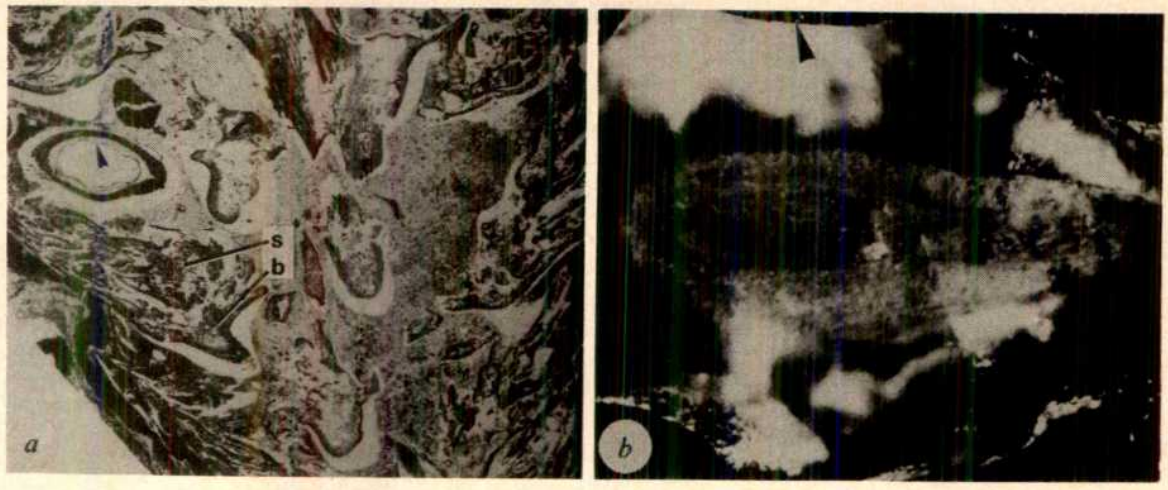

Fig. 1 Walchian conifer cone, bearing seeds with cotyledonary embryos. *a*, Nonmedian longitudinal section of cone showing bracts, fertile shoots and seed (*B*, bract; *S*, shoot) (cone M1613, BL number 32×5); *b*, Reflected light view into the seed cavity of seed in *a*. Embryo with cotyledons at left and radicle at right within cellular megagametophyte tissue (×55). Arrows in *a* and *b* indicate comparable positions on megaspore membrane.

and the bipolar growth of modern gymnosperms characterized primitive Palaeozoic conifers. They also indicate that quiescence before seed germination may have initiated the evolution of seed dormancy. Perhaps more significantly, these seeds provide insight into the selection pressures and developmental mechanisms that could have been associated with the evolution of seed dormancy. Like those of pteridophytes, embryos of the most primitive gymnosperms (including conifer ancestors) presumably had continuous development from the zygote to seedling establishment[3,4]. In the relatively moist lowlands inhabited by the most ancient gymnosperms[21] environmental conditions were probably conducive to seedling establishment most of the time, and immediate germination of seeds probably did not pose a significant reduction in fitness. Immediate germination also would dramatically reduce the probability of seeds with well developed embryos becoming fossilized. But in environments which are more arid or only periodically moist, unregulated germination would lead to the death of a large percentage of seedlings. Under such conditions, delay of seed germination until the onset of the appropriate environmental conditions could impart a significant selective advantage.

As we have suggested here, conifers may have been the most ancient seed plants to display quiescence before seed germination, a possible adaptation for coordinating seed germination with intermittent wetness. We envisage that quiescence, together with specialized features of the vegetative organs, may have dramatically increased physiological tolerance to water stress. The first occurrence of quiescence in these ancient conifers is concordant with the initial establishment of extensive plant communities on relatively dry extra-basinal slopes[23,24] and provides evidence that the origin of seed dormancy contributed to a phenotypic breakthrough[24,25] that facilitated colonization of previously unforested habitats. This emphasizes the role of evolutionary ecology in significantly increasing the numbers and diversity of Palaeozoic conifers as major drying trends produced widespread aridity in the Permian.

Benign familial neonatal convulsions linked to genetic markers on chromosome 20

Recurrent seizures, commonly known as epilepsies, occur in 1.7% of the general population by age 40[1]. The factors that initiate or underlie seizures are not well understood, but trauma, infectious disease and genetics have been implicated. An understanding of the molecular basis of seizures would shed light on the basic mechanisms of neuronal homeostasis and allow new therapeutic strategies to be explored. Here, we report the mapping of an epilepsy gene to a specific chromosomal region, on the basis of cosegregation of two closely-linked DNA markers with a form of epilepsy known as benign familial neonatal convulsions (BFNC[2], #12120 in ref. 3). The linked markers confirm the genetic basis and autosomal dominant inheritance of this trait, and localize the gene causing BFNC in this family to the long arm of chromosome 20. This regional placement is the first step towards the isolation of a gene involved in neuronal activity in the human brain.

The segregation pattern of BFNC has indicated an autosomal dominant mode of inheritance with high penetrance. Including the original description of this type of seizure by Rett and Teubel in 1964[4], 24 separate pedigrees have been identified[5–13]. Diagnosis of BFNC is based on inheritance, the exclusion of other causes for neonatal seizures, and the developmental pattern of the seizures, which typically start within the first week of life and end spontaneously by six months of age. Subsequent neurological and intellectual development is normal, although a minority (about 10%) of individuals have seizures later in life[5].

We undertook a genetic linkage study of a large, four-generation family (Fig. 1) that included 19 individuals who had documented neonatal or infantile seizures and had met the specific diagnostic criteria for BFNC[14]. Because accurate phenotypic characterization of family members is critical for the success of this approach, the results of laboratory tests for other possible causes of neonatal convulsions were examined for recent generations; all were negative[14]. Pyridoxine dependency was ruled out as the cause of seizures in this family because of the dominant mode of inheritance, the ability of standard anticonvulsants to control the seizures and the absence of mental retardation.

Linkage analysis was performed with the program LINKAGE[15]. We assumed autosomal dominant inheritance of a BFNC gene with a penetrance of 0.9. This conservative assumption of high but incomplete penetrance is supported by published accounts of four families in which an unaffected person has an affected child and also an affected sibling or parent, and by the estimated segregation ratio of 42% in 208 siblings and offspring of probands in 17 BFNC families[8,10,16,17]. Two polymorphic DNA marker loci, CMM6 (D20S19, ref. 18) and RMR6 (D20S20, ref. 19), were found to be tightly linked to the disease locus, giving maximum lod scores (log likelihood ratios) of 3.12 ($\theta = 0.003$) for RMR6 and 2.87 ($\theta = 0.039$) for CMM6; the score for RMR6 corresponds to a likelihood ratio of >1,000/1 in favour of linkage (Table 1).

Joint analysis of the inheritance pattern of the three loci greatly increased our confidence that the two markers are linked to the BFNC gene. In our panel of 59 reference families[20], CMM6 and RMR6 had a maximum lod score at a recombination frequency of 1.6%; when a recombination fraction of 0.016 was assumed for the interval between the two markers in joint analysis with the BFNC locus, the likelihood ratio supporting linkage of the BFNC gene to the two marker loci increased to >500,000/1 (lod score of 5.64, Table 1). The total number of markers tested was 96, and therefore significance for linkage would require a maximum lod score of a least 5.0 (ref. 21). As there are no obligate recombinants in this family we were unable to order the disease locus with respect to the two markers. Because recombinants might be found in a larger sample,

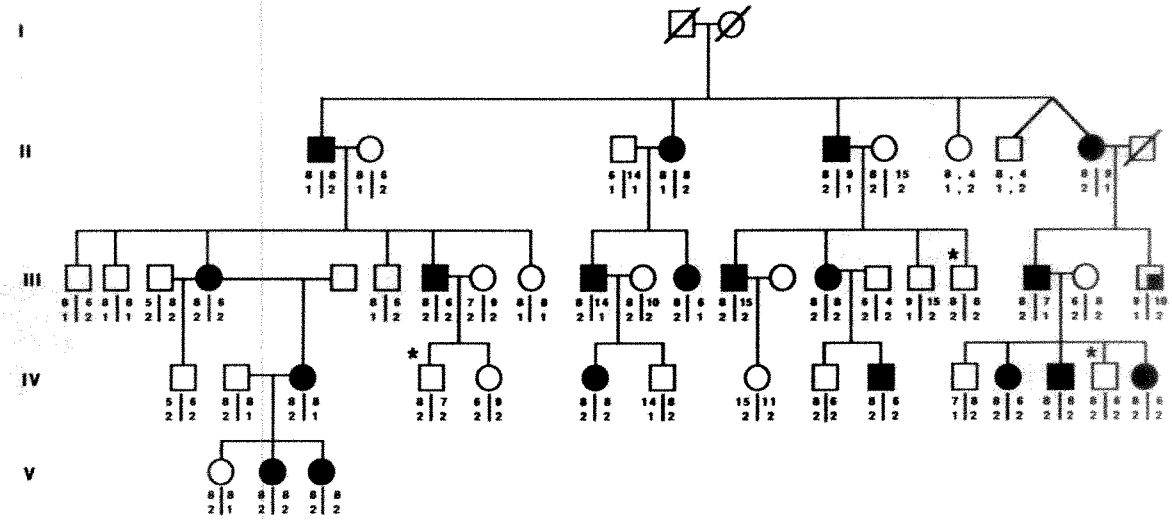

Fig. 1 BFNC pedigree; individuals diagnosed as having the characteristic pattern of seizures are represented by filled circles (females) or squares (males). An individual in generation III with febrile seizures, represented by a filled lower right quadrant, was considered phenotypically unknown for purposes of linkage analysis because his clinical pattern was not typical of BFNC. Under each genotyped individual, alleles are listed for the markers CMM6 (upper) and RMR6 (lower). For the marker locus defined by the probe pCMM6, the restriction enzyme *Taq*I revealed 10 distinct alleles within this family, ranging in size from 2.3 to 6.0 kilobases (kb)[18]. The same enzyme revealed a two-allele polymorphism with the probe pRMR6, with fragment sizes of 2.3 and 2.6 kb[19]. The alleles from the two markers were haplotyped in all except the two individuals in generation II whose allele numbers are separated by commas rather than by a vertical line. Asterisks denote members predicted to possess the mutant gene on the basis of inherited marker alleles, but whose medical records do not indicate the BFNC phenotype.

Table 1 Lod scores (multipoint and pairwise) between BFNC and three DNA markers in a five-generation pedigree

Marker locus	Lod score at recombination fraction of					
	0.00	0.05	0.10	0.20	0.30	0.40
CMM6-RMR6	5.64	5.50	5.20	4.20	2.90	1.40
RMR6	3.12	3.05	2.88	2.32	1.57	0.69
CMM6	2.87	2.92	2.83	2.36	1.63	0.76
MS1-27	−9.11	−3.51	−2.33	−1.12	−0.49	−0.15

Lod scores have been calculated with penetrance = 0.9. When penetrance was varied from 0.70–0.95, maximum lod scores ranged from 5.98–5.02.

however, a confidence interval with boundaries defined by a tenfold decrease in likelihood (the 1-lod confidence interval[22]) must be considered. This boundary for the BFNC gene is found at a recombination frequency of 15% on either side of the two tightly linked markers.

The two DNA marker loci were mapped to chromosome 20 by linkage in reference families with a third DNA marker locus, MS1-27 (D20S4, ref. 23). The MS1-27 locus has been physically mapped to human chromosome 20 using somatic cell hybrids[24], and *in situ* hybridization has confirmed that chromosomal assignment and provided independent, subregional localization of the MS1-27 locus to 20q13.2 (ref. 25). The CMM6 locus gave a lod score of 4.41 with the MS1-27 locus at a recombination frequency of 32.6%, establishing linkage.

We conclude that a mutation at a single genetic locus, located on the long arm of chromosome 20, strongly predisposes individuals in this family to benign neonatal convulsions. Although no obligate recombinants are evident in Fig. 1, the three unaffected individuals indicated by asterisks would be inferred in the linkage analysis to carry the mutation. Without additional information, we cannot determine whether these three subjects reflect recombination events that have occurred between the seizure locus and the marker loci, or reduced penetrance of the BFNC allele.

The next step will be to identify candidate genes from the region of chromosome 20 that seems to harbour the BFNC mutation. Genes that could be considered probable candidates on the basis of their expected physiological role can now be critically tested by determining whether they map to the same region as BFNC; those that map elsewhere can be excluded. For example, a potential candidate for the BFNC mutation might have been the gene encoding glutamate decarboxylase, an enzyme that converts glutamate to the neurotransmitter inhibitor gamma aminobutyric acid; but the glutamate decarboxylase gene is known to reside on chromosome 2[26].

Our observation of genetic linkage not only defines a location, but also confirms the single-gene origin of BFNC in one family. There are few clinical grounds for suspecting that different mutant genes are responsible for BFNC in other families, but they do include an impression that the development of non-febrile seizures after six months of age may be restricted to certain pedigrees. The issue of genetic heterogeneity can be resolved by testing additional families with the two markers described here. Attention then can be directed towards a search for the gene and an explanation for the distinctive developmental pattern of seizures in the BFNC syndrome.

The authors wish to acknowledge the technical assistance of M. Hoff, C. Martin, R. Myers, B. Ogden and T. Sears, and to thank I. Bjerre and J. Zonana for their interest in initiating the collection of family material for later tests of heterogeneity. I. Leppik, W. A. Hauser and S. S. Rich provided helpful discussions. R. Foltz edited the manuscript. This work was supported in part by a grant from the NIH-NINCDS to the Comprehensive Epilepsy Program, University of Minnesota. R. W. and J.-M.L. are Investigators at the Howard Hughes Medical Institute.

Arginine vasopressin enhances pH_i regulation in the presence of HCO_3^- by stimulating three acid-base transport systems

Michael B. Ganz*, Gregory Boyarsky, R. Bernd Sterzel & Walter F. Boron†

* Department of Medicine, Section of Nephrology and Department of Cellular and Molecular Physiology, Yale University School of Medicine, New Haven, Connecticut 06511, USA

Growth factors raise intracellular pH (pH_i) by stimulating Na^+/H^+ exchange in the absence of HCO_3^- (refs 1–4). In mutant cells that lack the Na^+/H^+ exchange activity, this alkalinization does not occur, and the cells do not proliferate without artificial elevation of pH_i[5,6]. It has therefore been widely suggested that an early pH_i increase is a necessary signal for mitogenesis. In the presence of HCO_3^- however, growth factors fail to raise pH_i in A431 cells[7], renal mesangial cells[8] and 3T3 fibroblasts[9]. In mesangial cells, arginine vasopressin (AVP) raises pH_i in the absence of HCO_3^-, but lowers it when HCO_3^- is present; growth is stimulated under both conditions[8]. We report here that, in the presence of HCO_3^-, AVP stimulates two potent HCO_3^- transporters, as well as the Na^+/H^+ exchanger. These are the Na^+-dependent and Na^+-independent Cl^-/HCO_3^- exchangers. Our results indicate that AVP causes acidification in the presence of HCO_3^- because, at the resting pH_i, it stimulates Na^+-independent Cl^-/HCO_3^- exchange (which lowers pH_i) more than it stimulates the sum of Na^+/H^+ exchange and Na^+-dependent Cl^-/HCO_3^- exchange (both of which raise pH_i). The stimulation of three acid-base transporters by the growth factor AVP greatly enhances the ability of the cell to regulate pH_i.

We examined the effect of AVP in the presence of HCO_3^- on the two acid-extruding transporters previously identified in mesangial cells[10,11]: the Na^+/H^+ exchanger and the Na^+-dependent Cl^-/HCO_3^- exchanger. Figure 1*a* illustrates the effect of AVP on the ability of cells to recover from an acute intracellular acid load imposed by an NH_4^+/NH_3 prepulse[12]. The application

† To whom correspondence should be addressed.

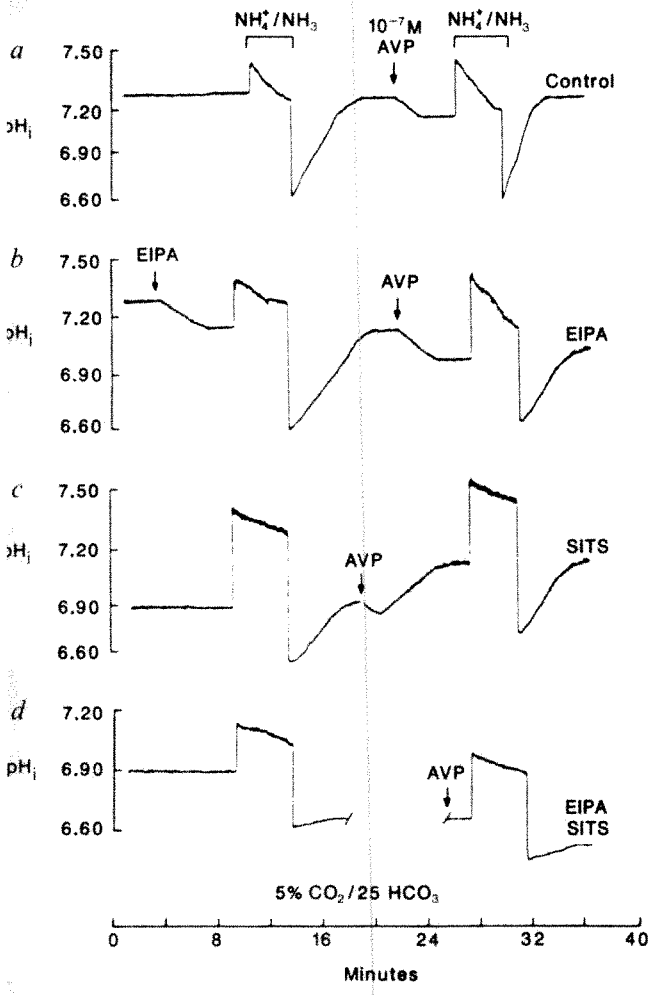

Fig. 1 Effect of 10^{-7} M AVP on the recovery of pH_i from an NH_4^+-induced acid load. For each of the four protocols, the cells were acid-loaded twice by applying and then withdrawing a solution containing 20 mM NH_4^+ (standard HCO_3^- solution (see below) with 20 mM NH_4^+ replacing 20 mM Na^+), first in the absence and then in the presence of AVP. We verified that, in the absence of AVP, the pH_i recovery rates from two consecutive NH_4^+ pulses were within 7±6% (NS) of each other (data not shown). *a*, Control in absence of EIPA and SITS ($n = 14$). *b*, With EIPA ($n = 14$). EIPA (50 μM) was added at the time indicated by the arrow, and was present thereafter. *c*, With SITS ($n = 20$). Because the fluorescence of SITS interferes with that of BCECF (see Methods), SITS was applied to the mesangial cells for 1 hour before the experiment and then washed off vigorously. Addition of AVP to the SITS-pretreated cells produces the pH_i response normally seen in the absence of HCO_3^-, a transient acidification followed by a sustained alkalinization[8]. Thus, the sustained acidification normally produced by AVP in HCO_3^- (*a*) requires a SITS-sensitive transporter. *d*, EIPA plus SITS ($n = 14$). Cells were preincubated for 1 hour in SITS and then washed as in (*c*). EIPA (50 μM) was applied during dye loading and was present thereafter. After EIPA/SITS treatment, the acid extrusion is so slow that pH_i fails to recover beyond ~6.7, and AVP failed to stimulate this slow pH_i recovery.

Methods. Mesangial cells were isolated from glomeruli of young male rats, characterized and maintained in culture as previously described[15]. MCs (passage 2-5) were grown on glass cover slips in mesangial cell growth medium consisting of DMEM plus 20% FCS, 5 μg ml^{-1} insulin, 10 mM L-glutamine, 400 ng ml^{-1} penicillin, 500 ng ml^{-1} streptomycin and 25 mM HCO_3^-. Mesangial cells were rendered quiescent by reducing FCS to 0.5% for 48 h before the pH_i experiments. They were then dye-loaded[8,16] with 10 μM of the acetoxy methylester of BCECF (2,7 biscarboxylethyl-5 (6)-carboxyfluorescein) from a 10 mM stock in DMSO for 20 min at 37 °C. The cover slip with cells was placed in a thermostatically controlled cuvette (37 °C) in a Perkin-Elmer LS-5B spectrofluorometer. We alternately excited the dye at 440 and 500 nm, and measured the fluorescence emission at 530 nm. The BCECF fluorescence excitation ratio was calibrated using the high-K^+/nigericin technique[8,17]. All experiments were performed in CO_2/HCO_3^- solutions. The standard HCO_3^- solution contained (in mM): Na^+, 145; K^+, 5.0; Ca^{2+}, 1.8; Mg^{2+}, 1.0; Cl^-, 122; HCO_3^-, 25; SO_4^{2-}, 1.0; phosphate, 1.0; and glucose, 10, and was equilibrated with 5% CO_2/95% O_2 at pH 7.40. EIPA was a gift of Dr Burckhard (Frankfurt, FRG).

and subsequent removal of 20 mM NH_4^+ causes pH_i to decrease rapidly. The intracellular pH recovers from this acid load because of the activity of the ethyl isopropylamiloride (EIPA)-sensitive Na^+/H^+ exchanger, which accounts for about one-third of acid extrusion[10], and the SITS-sensitive Na^+-dependent Cl^-/HCO_3^- exchanger, which accounts for about two-thirds[11] (see Table 1 legend). After application of 10^{-7} M AVP, pH_i falls slowly as previously described[8], and recovery from an NH_4^+-induced acid load is substantially faster. In 14 experiments, AVP increased the mean rate of pH_i recovery ($d(pH_i)/dt$), at $pH_i = 6.60$, from 77.6 to 145.2×10^{-4} pH units $second^{-1}$ ($P < 0.001$). The total buffering power (β_{total}) was 22.5 and 23.7 mM per pH unit in the presence and absence of AVP respectively. Thus, the net acid-extrusion rate ($J_{ext} = d(pH_i)/dt \times \beta_{total}$) increased from 183 to 326 μM s^{-1} (see Table 1).

To determine the proportion of the increased J_{ext} that is due to stimulation of Na^+/H^+ exchange, we repeated the experiment in Fig. 1*a*, but blocked Na^+/H^+ exchange with 50 μM EIPA (Fig. 1*b*). Application of EIPA causes a sustained pH_i decrease, indicating that Na^+/H^+ exchange is active in the presence of HCO_3^-. EIPA also slows the pH_i recovery from NH_4^+-induced acid loads, both in the absence and presence of AVP. Table 1 includes a comparison of results of experiments such as those in Fig. 1*a* and *b*. In the absence of AVP, EIPA reduces J_{ext} from 183 to 121 μM s^{-1}, so that the EIPA-sensitive component of J_{ext} (that is, Na^+/H^+ exchange) is 62 μM s^{-1}. In the presence of AVP, EIPA reduces J_{ext} from 326 to 205 μM s^{-1}, so that the EIPA-sensitive component of J_{ext} is 121 μM s^{-1}. Thus, AVP increases Na^+/H^+ exchange activity from 62 to 121 μM s^{-1}. Nevertheless, this increment (59 μM s^{-1}) accounts for less than half the total increase in J_{ext} (142 μM s^{-1}) elicited by AVP.

We performed the experiment shown in Fig. 1*c* to determine whether stimulation of the Na^+-dependent Cl^-/HCO_3^- exchanger accounts for the rest of the AVP-elicted increase in J_{ext}. Mesangial cells were pre-incubated for 1 hour with 0.5 mM SITS, a treatment that permanently blocks both the Na^+-dependent and Na^+-independent Cl^-/HCO_3^- exchangers[10,11]. The mean initial pH_i (6.94±0.04) after SITS pretreatment was significantly lower ($P < 0.001$; $n = 20$) than for matched controls (7.30±0.03), indicating that the acid-extruding Na^+-dependent Cl^-/HCO_3^- exchanger is more active than the acid-loading Na^+-independent exchanger in the normal steady state. As shown in Fig. 1*c*, the pH_i recovery rate from an acid load is substantially slowed by SITS pretreatment, both in the absence and presence of AVP. The data are summarized in Table 1. In the absence of AVP, SITS reduces J_{ext} from 183 to 62 μM s^{-1}, so that the SITS-sensitive component of J_{ext} (HCO_3^- transport) is 121 μM s^{-1}. In the presence of AVP, SITS reduces J_{ext} from 326 to 90 μM sec^{-1}, so that the SITS-sensitive component of J_{ext} is 236 μM s^{-1}. Thus, AVP nearly doubles HCO_3^--dependent acid extrusion, from 121 to 236 μM s^{-1}. This underestimates the stimulation of Na^+-dependent Cl^-/HCO_3^- exchange, because SITS pretreatment also blocks the Na^+-independent Cl^-/HCO_3^- exchanger.

If the AVP-induced increase in J_{ext} is due to the dual stimulation of Na^+/H^+ exchange and Na^+-dependent Cl^-/HCO_3^- exchange, then the application of both EIPA and SITS would block the effect of AVP. Cells preincubated with SITS and then exposed to EIPA exhibit little recovery from an acid load, with or without AVP (Fig. 1*d*). In six other experiments (data not shown) we blocked Na^+-dependent Cl^-/HCO_3^- exchange by pretreating cells for 1 hour in a medium lacking chloride, and blocked Na^+/H^+ exchange with EIPA. The results were identical to those shown in Fig. 1*d*. Because the SITS-sensitive component of AVP-stimulated acid extrusion is also Cl^- dependent, it is not mediated by the introduction of a new Cl^--independent mechanism, such as Na^+/HCO_3^- cotransport[13].

Because AVP stimulates both acid extruders, it could lower pH_i (see Fig. 1*a*) only if an acid-loading mechanism were

Table 1 Effect of EIPA and SITS on acid extrusion rate J_{ext} after a 20 mM NH_4^+ prepulse J_{ext} ($\mu M\ s^{-1}$)

	Control	EIPA	SITS	EIPA-sensitive (Na^+/H^+ exchange)	SITS-sensitive (HCO_3^- transport)	Acid-loading
−AVP	183 ± 4	121 ± 2	62 ± 2	62	121	0
+AVP	326 ± 12	205 ± 10	90 ± 3	121	236	31
AVP-dep.	142 ± 8			59	115	31
% Stimulation	78			95	95	

Fluxes were calculated as the product of $d(pH_i)/dt$ and β_{total} ($\beta_{total} = \beta_{HCO_3^-} + \beta_{non\text{-}HCO_3^-}$). Values of $d(pH_i)/dt$ were determined at pH_i 6.6 $\beta_{non\text{-}HCO_3^-}$, 13.4 mM per pH unit in the presence and 14.6 mM per pH unit in the absence of AVP ($n = 10$), was measured by briefly exposing mesangial cells to 10 mM NH_4^+ in the absence of Na^+ and HCO_3^-. $\beta_{HCO_3^-}$ was 9.1 mM per pH unit at pH_i 6.6. AVP increases the total J_{ext} by 142 instead of the expected 174 $\mu M\ s^{-1}$ (59 + 115 $\mu M\ s^{-1}$). This implies that AVP not only stimulates the two acid extruders, but also increase EIPA/SITS-insensitive acid loading to 31 $\mu M\ s^{-1}$, whereas in the absence of AVP there is no discrepancy. Thus, the growth factor substantially increases background acid-loading. SITS is 4-acetamido-4′-isothiocyanostilbene-2,2′-disulphonate, DIDS is 4,4′-diisothiocyanostilbene-2,2′-disulphonate.

stimulated even more. To determine whether AVP enhances Na^+-independent Cl^-/HCO_3^- exchange, we determined the Cl^-/HCO_3^- exchange rate from the pH_i increase induced by acute removal of external Cl^- (ref. 11). As shown in Fig. 2*a*, Cl^- removal reverses the exchanger, producing an HCO_3^- influx that raises pH_i. This alkalinization is DIDS-sensitive (see Table 1 legend), and is larger and faster in the presence of AVP. AVP increased Na^+-independent Cl^-/HCO_3^- exchange by 129%, increasing the DIDS-sensitive J_{ext} from 313 to 717 $\mu M\ s^{-1}$ (Table 2). The Na^+-dependent Cl^-/HCO_3^- exchanger, which is relatively inactive at pH_i values at or above normal, does not contribute to the pH_i increase elicited by Cl^- removal. In the absence of Na^+, AVP increased the DIDS-sensitive alkalinization induced by Cl^- removal by 112% ($n = 14$), close to the stimulation observed in the presence of Na^+ (data not shown).

Table 2 Effect of DIDS on equivalent net influx of HCO_3^- (J_{ext}) induced by Cl^- removal

	J_{ext} ($\mu M\ s^{-1}$)		
	Control	DIDS	DIDS-sensitive (HCO_3^- transport)
−AVP	333 ± 30	20 ± 1	313 ± 20
+AVP	780 ± 40	63 ± 3	717 ± 40
AVP-dep.	447 ± 3	43 ± 4	404 ± 13
% Stimulation	134 ± 14		129 ± 17

Fluxes calculated as in Table 1, but at pH_i 7.5. $\beta_{HCO_3^-}$ was 72.5 mM per pH unit at pH_i 7.5.

An alternative assay for Na^+-independent Cl^-/HCO_3^- exchange is to acutely load the cells with alkali and monitor the rate at which pH_i returns to normal. We alkali-loaded the cells by applying and then withdrawing a solution buffered to pH 7.4 with 10% CO_2/50 mM HCO_3^-. The introduction of this solution caused a sustained pH_i increase (Fig. 2*b*); this alkalinization was absent in cells pretreated with SITS (data not shown). When the mesangial cells were returned to 5% CO_2/25 mM HCO_3^-, pH_i rapidly increased because of CO_2 efflux), representing an acute alkali load. The subsequent recovery to the original pH_i is probably due to Na^+-independent Cl^-/HCO_3^- exchange, in that the equivalent HCO_3^- efflux (J_{load}) is blocked by more than 90% by either DIDS or Cl^- removal (Fig. 2*b* and Table 3). The Na^+-dependent Cl^-/HCO_3^- exchanger does not contribute to this pH_i decline: this transporter is normally an acid extruder, and it is virtually inactive at high pH_i[14]. AVP strongly stimulates the DIDS-sensitive/Cl^--dependent pH_i recovery from an alkali load (Fig. 2*c*). The DIDS-sensitive component of J_{load} (Table 3) is increased from 568 to 1,385 $\mu M\ s^{-1}$, a stimulation of 143%. The DIDS-insensitive and Cl^--independent components of the pH_i recovery are not significantly affected by AVP. Thus, Cl^-/HCO_3^- exchange is stimulated by more than 100% by AVP. Because AVP produces a fall o steady-state pH_i in control conditions, its effect in the physiologi cal pH_i range must be to increase the amount of acid-loadin by Na^+-independent Cl^-/HCO_3^- exchange more than th amount of acid extrusion by the other two transporters.

The growth factor-induced increase in pH_i is not observed i the presence of HCO_3^- despite suggestions that it may be

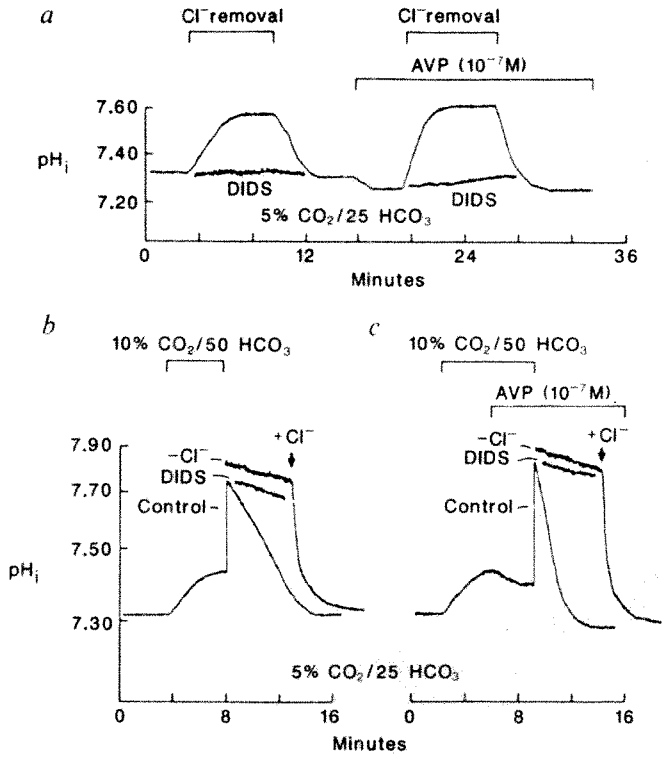

Fig. 2 Effect of 10^{-7} M AVP on Na^+-independent Cl^-/HCO_3^- exchange. *a*, Cl^-/HCO_3^- exchange assessed by Cl^- removal (Cl^- replaced by aspartate) and readdition ($n = 16$). Separate experiments were performed in 50 μM DIDS, which does not interfere with BCECF fluorescence ($n = 16$). *b*, Cl^-/HCO_3^- exchange assessed by pH_i recovery from acute alkali load in the absence of AVP. The alkali load was imposed by applying and withdrawing 10% CO_2/50 mM HCO_3^- (standard HCO_3^- solution, with 25 mM extra HCO_3^- replacing 25 mM Cl^-). The 10% CO_2/50 mM HCO_3^- solution caused pH_i to increase by 0.12 ± 0.03 ($P < 0.01$). The experiment was performed under control conditions ($n = 12$), in the presence of 50 μM DIDS ($n = 12$), and with Cl^- replaced with aspartate ($n = 12$). *c*, Cl^-/HCO_3^- exchange assessed by pH_i recovery from acute alkali load in the presence of AVP. As in (*b*), the experiment was performed under control conditions ($n = 12$), in the presence of 50 μM DIDS ($n = 12$), and in the absence of Cl^- ($n = 12$).

% Stimulation	140 ± 11			143

Fluxes calculated as in Table 1, but at pH 7.7. $\beta_{HCO_3^-}$ was 114.9 mM per pH unit at pH_i 7.7.

crucial mitogenic signal. It could be advantageous for an activated cell to maintain a steady-state pH_i close to the unactivated level given the sensitivity to pH of nearly all cellular processes. Such a steady-state pH_i is achieved when processes that acid-load the cell (for example Na^+-independent Cl^-/HCO_3^- exchange) balance those that alkali-load it (for example, Na^+/H^+) and Na^+-dependent Cl^-/HCO_3^- exchange). It would also be advantageous however, for the activated cell to be able to recover more rapidly from acid and alkali loads. The requirements for both a near-normal steady-state pH_i and enhanced pH_i regulation can only be met if increases in acid loading and acid extrusion by the growth factor are comparable. This is precisely the response of the mesangial cell to AVP: application of the growth factor causes only a small decrease in steady-state pH_i, but enormous increases in the rate at which the cell recovers from both acid (Fig. 1*a*) and alkali loads (Fig. 2*c*). This effect of AVP on pH_i does not seem to be an isolated event, as we have found eight other growth factors that also produce only a small pH_i decrease in the presence of HCO_3^- (data not shown). Thus, an important physiological effect of the growth factor is to maintain a near-normal pH_i while stimulating several acid-base transporters.

A pentapeptide as minimal antigenic determinant for MHC class I-restricted T lymphocytes

Matthias J. Reddehase*, Jonathan B. Rothbard† & Ulrich H. Koszinowski‡

Peptides that are antigenic for T lymphocytes are ligands for two receptors, the class I or II glycoproteins that are encoded by genes in the major histocompatibility complex, and the idiotypic α/β chain T-cell antigen receptor[1–9]. That a peptide must bind to an MHC molecule to interact with a T-cell antigen receptor is the molecular basis of the MHC restriction of antigen-recognition by T lymphocytes[10,11]. In such a trimolecular interaction the amino-acid sequence of the peptide must specify the contact with both receptors: agretope residues bind to the MHC receptor and epitope residues bind to the T-cell antigen receptor[12,13]. From a compilation of known antigenic peptides, two algorithms have been proposed to predict antigenic sites in proteins. One algorithm uses linear motifs in the sequence[14], whereas the other considers peptide conformation and predicts antigenicity for amphipathic α-helices[15,16]. We report here that a systematic delimitation of an antigenic site precisely identifies a predicted pentapeptide motif as the minimal antigenic determinant presented by a class I MHC molecule and recognized by a cytolytic T lymphocyte clone.

Synthetic peptides have been derived from the amino-acid sequence of pp89, an immediate-early (IE) phase regulatory protein of murine cytomegalovirus[17–20]. The 19-mer P(161–179) contained within its 595 residues[18] is an antigenic sequence[21]. This sequence H_2N-[161]GRLMYDMYPHFMPTNLGPS[179]-COOH (one-letter code) contains the predicted motif HFMPT[14]. By screening a series of related peptides that had been reduced in length from both terminals (not all shown), we found that the nonapeptide YPHFMPTNL represents the optimal antigenic peptide (Fig. 1 and Table 1) for the cytolytic T lymphocyte (CTL) IE1 clone[22,23]. Even though binding of peptides to class I molecules has not yet been demonstrated directly, the selective recognition on L/L^d cells implies that the L^d molecule is the

Dose-response titrations of peptides give the peptide molarities in solution required for detectable target formation (detection limit) and for optimal target formation (detection saturation). The concentration ranges are compiled from at least 3 and up to 12 independent experiments.

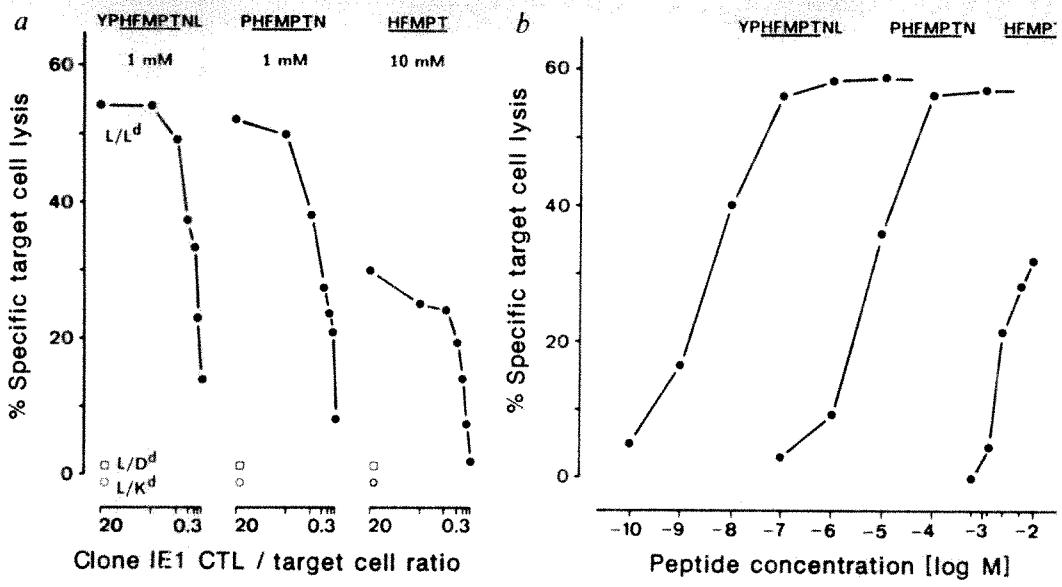

Fig. 1 Cytolytic assays demonstrating L^d-restricted recognition of peptides by CTL clone IE1 (*a*), and dose-response titrations of peptides (*b*). Each value in the peptide titrations represents the lysis determined from the plateau of a complete effector-to-target titration graph at a ratio of 20, and each value of % specific lysis is the mean of four replicate determinations.

Methods. Cytolytic effector cells: The murine (BALB/c strain; MHC^d) CTL line IE1.13-IL was derived from clone IE1 by recloning[22,23]. Clone IE1 expresses an α/β (Vβ6) TCR/CD3 complex and displays the surface phenotype $CD4^-CD5^-CD8^+Thy\text{-}1^+$. L fibroblast transfectants: L/L^d cells were derived from L cells by transfection with the L^d gene, and L/D^d and L/K^d transfectants were provided by M. Cochet and J. P. Abastado (Institut Pasteur). Surface expression of the L^d, D^d and K^d molecules was confirmed by cytofluorography with monoclonal antibodies. Synthetic peptides: Peptides were synthesized by using the Barany-Merrifield solid-phase technique on an Applied Biosystems Peptide Synthesizer, purified preparatively and analysed as described previously[13]. Preparation of target cells and cytolytic assay: Target cells were labelled at 37 °C for 1 h with $Na_2[^{51}Cr]O_4$. The radioactive cells were then distributed in aliquots of 10^5 cells and incubated in 0.2 ml for a further 1 h at 27 °C with peptides at defined molarities (1 M corresponds to 10^{15} peptide molecules per cell) dissolved in RPMI 1640 culture medium supplemented with 2% of FCS. The highest peptide concentration tested was 10^{-2} M. This limit was imposed by the solubility of the peptides. After washing to remove excess peptide and ^{51}Cr, a standard 3-h cytolytic assay was performed at 37 °C with 1,000 target cells and graded numbers of clone IE1 CTL. Competition assays: The ability of peptides to compete with the optimal antigenic nonapeptide YPHFMPTNL was tested in two ways. Either the concentration of the antigenic peptide was kept constant at 10^{-7} M and the competitor peptide titrated up to 10^{-4} M, or the concentration of the competitor peptide was kept constant at 10^{-4} M and the antigenic peptide was titrated from 10^{-5} to 10^{-10} M. In both cases the L/L^d target cells were pre-incubated for 30 min with the competitor peptide before the antigenic peptide was added.

receptor involved in the interaction with the T-cell antigen receptor (TCR) of clone IE1 for the family of peptides tested (Fig. 1*a*). Titration of the nonapeptide YPHFMPTNL, the heptapeptide PHFMPTN, and the pentapeptide HFMPT resulted in dose-response saturation curves showing thousandfold differences in antigenic potency (Fig. 1*b*). The data refer to a one-hour incubation of target cells with peptide. Differences in antigenic potency are also reflected by the time needed for optimal target formation; five minutes is long enough to prepare an optimal nonapeptide target, which is in line with data for a high-affinity peptide[24], whereas plateau lysis could be achieved with the pentapeptide only when the peptide pulse was prolonged to two hours or more (not shown). Because clone IE1 does not discriminate between nonapeptide and pentapeptide target once the target is formed, the limiting step is apparently the association between the peptide ligand and its MHC receptor on the target-cell surface. We therefore conclude that HFMPT forms the antigenic core of the peptides by comprising both the complete epitope for the TCR of clone IE1 and an agretope that is adequate, but not optimal for specification of the interaction with L^d.

The deletion of Tyr1 (Y) from peptide YPHFMPTNL diminished and the deletion of Leu 9 (L) destroyed the antigenicity, and the resulting octapeptides PHFMPTNL and YPHFMPTN both also failed to compete with YPHFMPTNL (Table 1). According to the currently used theorem for classifying residues as T-cell contact residues or as MHC-molecule contact residues[12], Tyr 1 and Leu 9 would have been interpreted as residues contacting the MHC molecule. This conclusion, however, was proven incorrect by the findings that PHFMPTN, which lacks both residues, was $>10^3$-fold more antigenic than PHFMPTNL (Table 1) and could not be competed by a 10^3-fold excess of YPHFMPTN (not shown), although both octapeptides include the heptapeptide sequence entirely. Results compiled in Table 1 follow a consistent pattern from the pentameric cor motif up to the nonapeptide size, in that symmetric addition of residues improved the antigenicity, whereas addition o residues at either end had a negative effect.

This communication adds new aspects to the current understanding of the MHC molecule-peptide-TCR interaction. The first aspect concerns the minimal length of antigenic peptides Until now, the shortest peptides reported as antigenic were heptapeptides presented by MHC class II molecules[25,26]. A recent study described a nonapeptide presented by an MHC class I molecule as minimal antigenic peptide of the glycoprotein of LCMV[27]. It should be emphasized that in our example systematic shortening from both termini was critical for the identification of the pentapeptide as the minimal antigenic peptide. Since the sequence of this pentapeptide is a predicted pentameric motif, and as most motifs are tetrameric[14], recognition even of tetrapeptides may be possible.

The second aspect concerns the classification of epitope and agretope residues. For the hen egg-white lysozyme peptide (52-61), Allen *et al.*[12] defined residues as MHC-antigen contact residues when a substitution led to the loss of both antigenicity and the ability to compete with the unmodified antigenic peptide. With this approach and proposing a helical conformation, agretope residues were segregated from epitope residues. From a set of overlapping peptides, Sette *et al.*[28] predicted a heptameric core in a planar conformation for the ovalbumin peptide (323-339). In contrast to these examples, we have positively identified the motif HFMPT as an antigenic core in pp89 peptides by demonstrating a direct antigenicity of the pentapeptide HFMPT. The important implication is that residues whose deletion causes loss of both antigenic potency and competitive ability are not necessarily agretope residues in the classical sense of MHC-receptor binding sites. We propose that residues flanking an antigenic core motif can affect the antigenic potency positively

or negatively by their influence on peptide conformation.

We thank Drs U. Weber and H. Kalbacher of the Physiologisch-chemisches Institut der Universität Tübingen for preparation of some of the peptides, and Dr Margarita Del Val for critical reading of the manuscript. The technical assistance of Irene Huber and the secretarial help of Sabine Grau is gratefully acknowledged. This work was supported by the Deutsche Forschungsgemeinschaft.

Class I cross-restricted T cells reveal low responder allele due to processing of viral antigen

Helen C. Bodmer, Frances M. Gotch & Andrew J. McMichael

Institute for Molecular Medicine, John Radcliffe Hospital, Oxford OX3 9DU, UK

Cytotoxic T lymphocytes (CTL) recognize protein antigens which have been processed by the target cell and then presented in association with the relevant class I molecule of the major histocompatibility complex (MHC)[1]. Short synthetic peptides, which are able to associate directly with target cells[1], may substitute for these processed fragments in stimulating antigen-specific CTL responses. Using this approach, a dominant HLA-A2-restricted epitope has previously been mapped to residues 58–68 of influenza A virus matrix protein[2]. Here we report HLA-A2-restricted CTL which are also able to recognize this short synthetic peptide in association with HLA-Aw69, but which fail to recognize HLA-Aw69 expressing cells infected with influenza A virus. Furthermore, individuals possessing HLA-Aw69 who respond to influenza A virus, do not respond to M58–68. These results imply that the low response to this epitope on infection of HLA-Aw69 individuals with influenza A is due to failure of the naturally processed product of matrix protein to associate with Aw69.

Individuals who express the common HLA-A2 variant, HLA-A2.1 (HLA-A*0202 as defined in ref. 3), and who can mount a cytotoxic response to influenza infected target cells, following *in vitro* stimulation with virus have been shown, in all cases tested to date, to possess CTL that specifically recognize synthetic peptides representing residues 56–68 of the matrix protein[4]. Individuals who have other variants of A2, or the closely related allele HLA-Aw69, which differs by six amino acids from A2*0202 (listed in Table 1)[5], did not respond to this region of matrix protein[4].

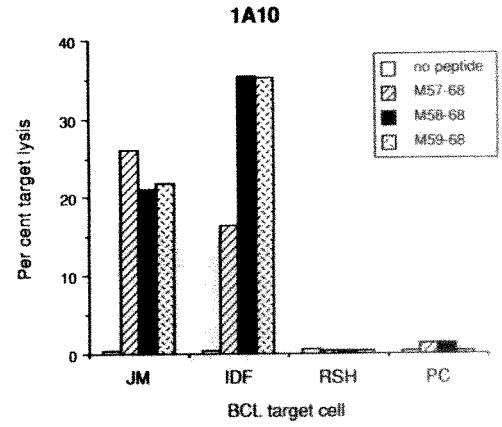

Fig. 1 CTL are cross-restricted, recognizing peptide on both autologous and Aw69-expressing target cells. Recognition by CTL clone 1A10 from the donor JM (A2, 2; B15, 51; DR4, 4) of peptides M57–58, M58–68, and M59–68 of influenza matrix protein on autologous BCL target cells (JM), three HLA-mismatched BCL, IDF (A26, w69; B18, 38; DR11, 11), RSH (A68, 68; B42, 42; DR3, 3) and PC (A3, 24; B37, 62; DR6, 6). $K/T = 1.5$, peptides present throughout assay 10 μM.
Methods. CTL clone 1A10 was derived from a parent line from the donor, JM. Peripheral blood lymphocytes were separated from whole blood, stimulated initially with A/X31 virus (grown and stored as previously described[18]) and maintained in culture by repeated stimulations with peptide M57–68, as previously described[4]. CTL were cloned by selection of CD8 positive cells (labelled with B941 antibody from Dr C. Mawas, and fluorescein-labelled anti-mouse immunoglobulin) using an Ortho Cytofluorograf cell sorter, into 96-well plates containing 10^4 irradiated BCL (pretreated with 50 μM M57–68) and IL-2 10 U ml^{-1} (Cetus Corp.) in RPMI containing 10% fetal calf serum. Monoclonality was indicated by the presence of a single β-chain gene rearrangement on Southern blotting (data not shown). Cytotoxic activity was assessed by incubating EBV-transformed lymphoblastoid cells (BCL), labelled with ^{51}Cr, with CTL and diluted peptide (where appropriate) for 4 h in round-bottomed 96-well plates. Per cent target lysis was calculated from the formula $(E - M/D - M) \times 100$ where E = experimental ^{51}Cr release, M = release in presence of culture medium (always <18%) and D = release by 5% Triton X-100. For details of the peptides see legend to Fig. 3.

We made several CTL lines and clones from a single HLA-A2 expressing individual, JM, some of which were able to recognize matrix peptide 56–68 in association with HLA-Aw69 as well as A2, although they were otherwise HLA-restricted (Fig. 2). CTL clone 1A10 was able to recognize the short synthetic peptides M57–68, M58–68 and M59–68 in association with both the autologous (JM) HLA-A2-expressing EBV-transformed B lymphoblastoid cell line (BCL), and a BCL expressing Aw69 which did not share any HLA alleles with JM (Fig. 1), but did not recognize two other HLA mismatched BCL in the presence of these peptides.

Although these matrix-specific A2-restricted CTL were able to recognize Aw69-expressing target cells in the presence of synthetic peptide, a discrepancy between recognition of A2 and Aw69 BCL was seen following A/X31 virus infection of the target cells (Fig. 2). Both autologous and A2-matched BCL were recognized following pretreatment with the peptide, or infection with influenza virus (Fig. 2*a*, *e*). In contrast Aw69-expressing BCL were very poorly recognized following virus infection, although they were well recognized after peptide treatment (Fig. 2*b*, *c*, *f*). In addition, virus-specific polyclonal CTL from an Aw69-expressing donor were unable to recognize the synthetic peptide M58–68 (Fig. 2*d*). Even with repeated stimulation of these latter CTL with M58–68 *in vitro*, we were unable to obtain a response from either of two Aw69-expressing (HLA identical)

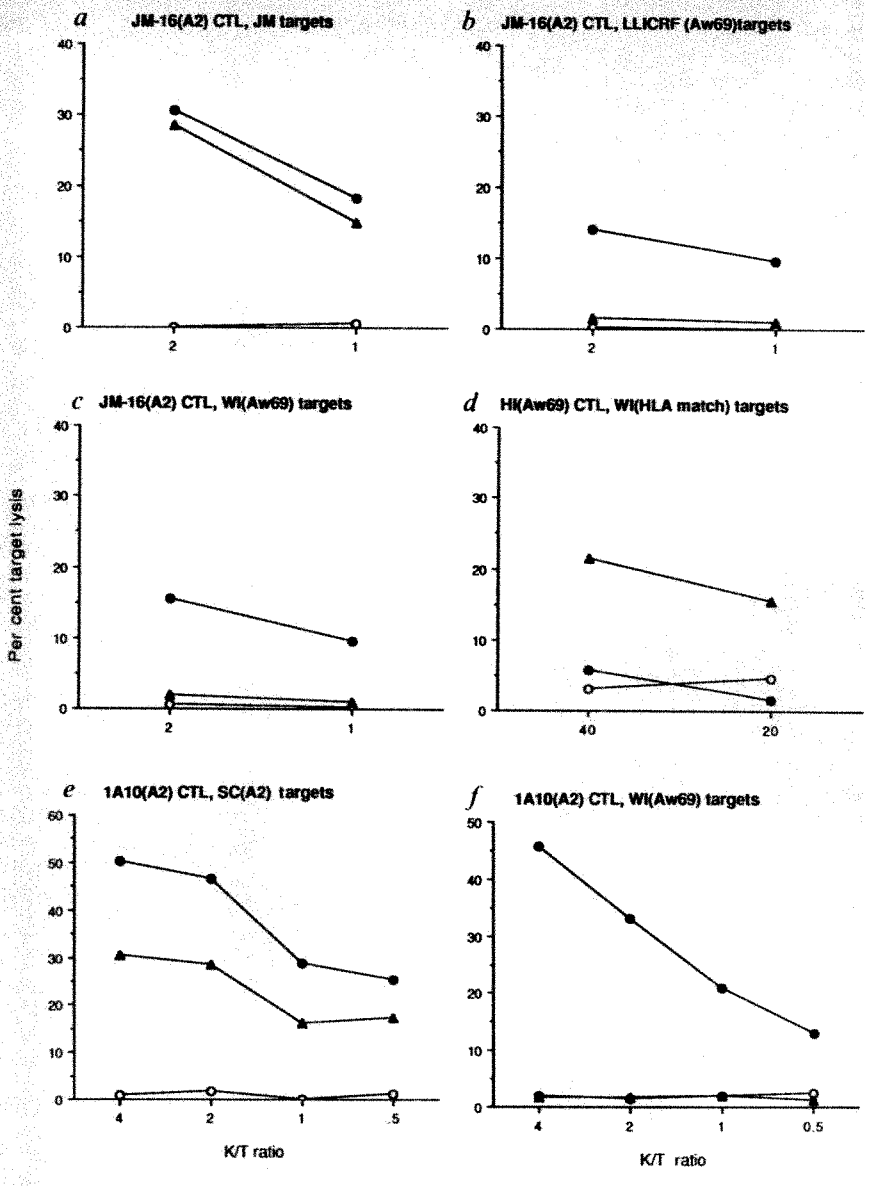

Fig. 2 HLA-Aw69-expressing BCL can present peptide, but not virus to A2-restricted matrix specific CTL, whereas an Aw69-expressing donor is able to respond to virus, but not matrix peptide. Polyclonal CTL line JM-16 was assayed for recognition of autologous BCL (*a*), or Aw69-expressing BCL LLICRF (A1, w69; B8, 35; DR10, 17) (*b*) or WI (Aw68, w69; B22, 51; DR2, 13) (*c*); target cells (10^4 per well), were either untreated (open circles), pretreated with 50 μM M58–68 (closed circles) or infected with A/X31 (closed triangles). Polyclonal CTL from donor HI (HLA-identical brother to WI) were assayed for recognition of WI target cells (*d*). In a separate experiment, the A2-restricted CTL clone, 1A10 (derived as in Fig. 1), was assayed for recognition of a BCL matched only through A2, (SC: A2, 2; B27, 27; DR2, 2) (*e*), or the Aw69-expressing BCL, WI (*f*).

Methods. JM-16 was derived as described in the legend to Fig. 1. Polyclonal CTL from donor HI were prepared by stimulating peripheral blood lymphocytes with A/X31 virus in culture for 7 days, as previously described[4]. The ^{51}Cr-release assay, was performed as for Fig. 1 except that BCL target cells were preincubated for 1 h with either medium, peptide or A/X31 virus, washed, and then rested in 1 ml medium at 37 °C for 3 h before ^{51}Cr-labelling, and addition to the assay.

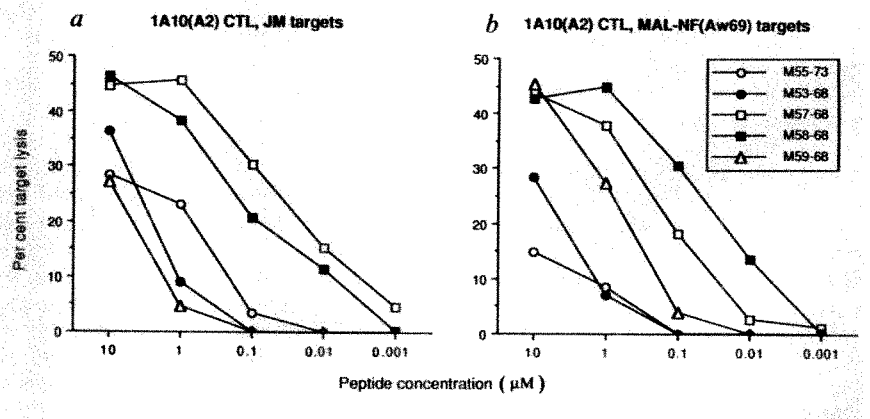

Fig. 3 The pattern of peptide recognition varies depending on whether the target cell expresses A2 or Aw69. CTL clone 1A10 ($K/T = 2$) was assayed for recognition of peptides of varying lengths in association with autologous BCL (*a*) or a BCL expressing Aw69 (MAL-NF: A1, w69; B35, 57; DR10, 17) (*b*) using 10^4 target cells per well. Non-specific lysis, that is in the absence of peptides, was 0% for both targets.

Methods. Influenza A virus matrix peptides M55–73 (leu-thr-lys-gly-ile-leu-gly-phe-val-phe-thr-leu-thr-val-pro-ser-glu-arg-gly); M53–68 (ser-pro-...) M55–68, M57–68, M58–68 and M59–68 were synthesized and donated by Dr J. Rothbard. The ^{51}Cr-release assay was performed as for Fig. 1.

donors. Thus, although Aw69 was able to present the synthetic peptide to CTL, Aw69 donors were non-responders to this epitope.

It is possible that patterns of immunodominance in a T-cell response may be influenced by other MHC molecules[5] or by other background genes[6]. But Aw69 target cells with different MHC types were all poor presenters to the A2-restricted CTL following virus infection (an example is shown in Fig. 2*b*). Therefore we propose that the Aw69 molecule itself, although binding the synthetic peptide well, may associate poorly with a naturally produced fragment. Peptide M58–68 is the optimum length for maximal target lysis by matrix-specific CTL restricted through HLA-A2 and cross-restricted through Aw69. There is, however, no evidence that this is the actual length of peptide produced when whole matrix protein is processed by a cell. We therefore assayed for killing of A2 or Aw69 targets using a

Table 1 Amino-acid differences between the sequences of HLA-A*0202 and HLA-Aw69

Position	A*0202	Aw69	Location†
9	Phe	Tyr	β-sheet, in
62	Gly	Arg	α-helix, up
63	Glu	Asn	α-helix, in
66	Lys	Asn	α-helix, in
70	His	Gln	α-helix, in
74	His	Asp	α-helix, in

† All amino-acid differences are in the α_1 domain, orientation is indicated, either pointing into the purative peptide binding site (in), or pointing towards the T-cell receptor (up), according to the crystal structure determined by Bjorkman *et al*[8,9].

number of peptides of varying lengths from this region (Fig. 3). The dose response curves of recognition by the CTL clone 1A10 of peptide M58–68 were very similar for both A2- (autologous) and Aw69-expressing target cells (Fig. 3). But recognition of the shorter peptide, M59–68 was more efficient on the Aw69 target, whereas recognition of the longer peptides, particularly M55–73, was approximately tenfold less efficient. This decreased efficiency may be sufficient to account for the low response if natural peptides are present in low concentrations.

HLA-Aw69, a rare allele, is the result of a natural exon shuffle between HLA-A2 and HLA-Aw68 (ref. 7) with the α_1 domain from Aw68 and the α_2 and α_3 domains from A2. Although there are only six amino-acid differences between Aw69 and A2 (listed in Table 1), reference to the crystal structure of A2, as defined by Bjorkman *et al*[8,9], suggests that these occur in areas likely to be important for either peptide binding or direct recognition of the MHC molecule by the T-cell receptor. Cross-restriction for recognition of foreign antigen by class I-restricted T cells has been reported infrequently. Human HLA-Aw69 restricted Epstein-Barr virus-specific CTL were able to recognize Aw68 (sharing the α_1 domain), but not A2-expressing BCL[10]. In mice, an exchange of the exons coding for the α_1 and α_2 domains of H-2 L^d and D^d maintained epitopes recognized by CTL specific for influenza or Sendai virus but not vesicular stomatitis virus[11]. Other reports of exon shuffles between the α_1 and α_2 domains have not identified cross-restricted CTL[12–14].

Cross-restricted CTL recognizing cyanogen bromide fragments of ovalbumin on target cells expressing three different H-2 types have been generated by priming *in vitro*[15,16] but these T cells were unable to recognize target cells expressing a transfected ovalbumin gene. A similar result was found with MHC class II-restricted T-cell clones, produced by priming mice with peptide *in vitro* in that the clones responded on processing and presentation of the native molecule[17]. In both these cases, the T-cell responses were generated against peptides that were not epitopes when the animals were primed with the native proteins. Here, we show that HLA-Aw69 can present a synthetic peptide to A2-restricted CTL, induced by natural infection, even though Aw69 is a non-responder allele to the native virus antigen. All of these results imply that the processing system limits the complexity of naturally induced T-cell immune responses.

We thank Dr N. Carter for operating the cell sorter, Dr A. Ting for HLA typing, Dr J. Rothbard for the peptides, Dr H. Festenstein for the cell line IDF, CETUS Corporation for recombinant IL-2 and Dr J. Bodmer for the cell lines LLICRF and MAL-NF. H.C.B. is in receipt of a Medical Research Council training fellowship. This work was supported by the MRC.

Characterization of the yeast *HSP60* gene coding for a mitochondrial assembly factor

Donald S. Reading*, Richard L. Hallberg* & Alan M. Myers†‡

Departments of Zoology* and Biochemistry and Biophysics†, Iowa State University, Ames, Iowa 50011, USA

The hsp60 protein isolated from the protozoan *Tetrahymena thermophila* is induced in response to heat stress and is a member of an immunologically conserved family represented in *Escherichia coli* and in mitochondria of plants and animals[1,2]. We report here the cloning and characterization of a nuclear gene, *HSP60*, which codes for the hsp60 homologue from the yeast *Saccharomyces cerevisiae*. Nucleotide sequence analysis revealed that yeast hsp60 is related to the groEL protein of *E. coli*[3–6] and the RUBISCO-binding protein (RBP) of chloroplasts[7]. *HSP60* was found to be the genetic locus of the conditional-lethal mutation described by Cheng *et al.*[8], which at non-permissive temperature is defective in the assembly of several different multisubunit complexes in mitochondria. These data are consistent with the hypothesis that the groEL-related proteins serve an evolutionarily conserved function as accessory factors facilitating the folding and/or association of individual subunits of multimeric protein complexes[7,9–14].

Polyclonal antiserum raised against purified *T. thermophila* hsp60 (ref. 1) was used to isolate a segment of the yeast *HSP60* gene by screening an expression library of genomic DNA fragments ligated into the λ-phage vector λgt11 (ref. 15). Analysis of a 3.0 kilobase (kb) yeast DNA fragment present in one positive clone revealed an open reading frame coding for a protein homologous to both groEL and RBP. We used this DNA as a hybridization probe to isolate an overlapping segment of the yeast genome which contained the entire *HSP60* coding sequence (Fig. 1).

The sequence of a 1.8-kb region containing *HSP60* is presented in Fig. 3, along with the derived amino-acid sequence. The *HSP60* gene codes for a polypeptide of 572 amino acids (relative molecular mass (M_r) 60,830) which is similar to both groEL and RBP (Fig. 4). Based on our previous finding that the hsp60 family of proteins is structurally and immunologically similar to groEL[2], we have defined this open reading frame as the yeast *HSP60* gene. Northern hybridization analyses showed that *HSP60* is transcribed into a mRNA of ~1.9 kb, commensurate with the estimated 64,000 (64K) M_r of hsp60 (Fig. 2). This mRNA is induced 2–3-fold above basal levels when cells are heat-stressed, in agreement with the heat-shock inducibility of hsp60 (refs 1, 2) (Fig. 2). Increasing the copy number of *HSP60* by transformation with the multicopy plasmid YEpHSP60 (Fig. 1) results in higher concentration of immunoreactive material in mitochondria (Fig. 2), providing further evidence for the identity of this gene.

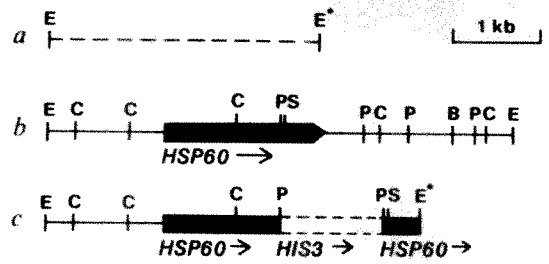

Fig. 1 Restriction maps of *HSP60* and *hsp60::HIS3*. *a*, The dotted line indicates the region of yeast genomic DNA isolated from a λgt11 clone which reacts with polyclonal antiserum raised against hsp60 purified from *Tetrahymena*[1]. The *Eco*RI site designated E* was inserted as a linker during construction of the library. *b*, restriction map of the genomic DNA fragment containing the region depicted in *a*. The black bar indicates the coding region of *HSP60* as determined by nucleotide sequence analysis, with the direction of transcription indicated by the arrow. Plasmid YEpHSP60 is comprised of this 5.3-kb *Eco*RI fragment cloned in the 2μ circle-based shuttle vector YEp352 (ref. 20). *c*, Restriction map of the null allele *hsp60::HIS3*. Black bars indicate the coding regions of *HSP60*, and dotted lines indicate a *HIS3*-containing fragment which interrupts *HSP60* by insertion at the *Pst*I site. The positions of restriction enzyme recognition sites are indicated for *Eco*RI (E), *Bcl*I (C), *Pst*I (P), *Sal*I (S) and *Bam*HI (B).

Methods. A library of yeast genomic DNA fragments in λgt11 (ref. 15) was screened with a polyclonal antiserum reactive with hsp60 (ref. 1). From 300,000 library recombinants screened, a single positive plaque was isolated which upon repurification gave only positive clones. The positive recombinant contained three *Eco*RI fragments within the λ arms, one of which hybridized to a heat-shock-inducible mRNA. This 3.0-kb fragment is depicted in *a*. Nucleotide sequence analysis of the ends of the 3.0-kb fragment revealed an open reading frame homologous to *groEL* which continued through the site marked E* in the 5′–3′ direction. Therefore, we used the 3.0-kb fragment as a hybridization probe to isolate an overlapping genomic fragment containing the entire *HSP60* gene. Southern hybridization analysis showed that the 3.0-kb fragment isolated from λgt11 was derived from a genomic *Eco*RI fragment of ~5 kb. A library of *Eco*RI fragments with a size of ~5 kb was preapred in the 'phagemid' vector pUC118 (ref. 21) and screened with the 3.0-kb fragment. Positive clones contained the 5.3-kb *Eco*RI fragment shown in *b*. Nucleotide sequence analysis (Fig. 3) revealed the location of *HSP60*. To construct *hsp60::HIS3* the 3.0-kb *Eco*RI fragment in *a* was cloned into the plasmid vector YEp352E, a derivative of YEp352 from which the *Pvu*II fragment containing the partial *lac* operon and multiple cloning site was removed and replaced with an *Eco*RI linker. The recombinant plasmid was linearized at the unique *Pst*I site within *HSP60* and ligated to a 1.15-kb fragment of yeast DNA containing the wild-type *HIS3* gene[22]. One of the *Pst*I sites delimiting this fragment is located downstream of the *HIS3* coding region[22], whereas the other *Pst*I site is derived from the pUC18 multiple cloning site. The linear *Eco*RI fragment shown in *c* was excised from YEp352E and used to transform the *his3⁻/his3⁻* diploid a/αW03 to histidine independence[23]. Southern hybridization analysis of chromosomal DNA verified that the His⁺ transformants had integrated the disrupted allele at the homologous site in one chromosome, and were of the genetic constitution *HSP60/hsp60::HIS3* (data not shown).

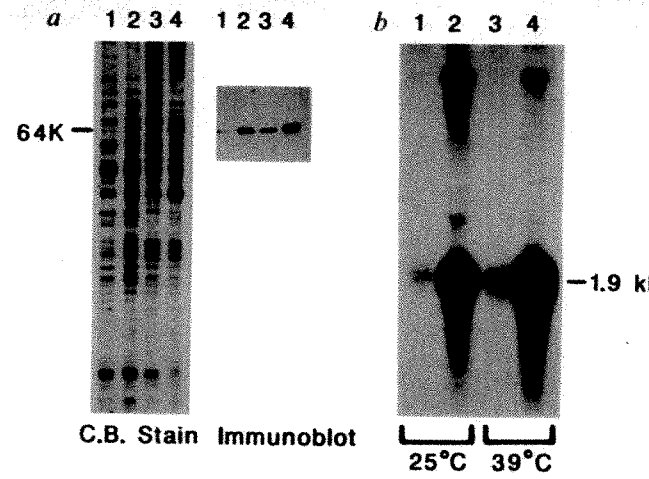

Fig. 2 *a*, Immunoblot analysis of cells containing single or multiple copies of *HSP60*. Haploid strain aW303 (lanes 1, 3) or the same strain transformed with YEpHSP60 (lanes 2, 4) were grown to mid-log phase at 30 °C. Sixty micrograms of total protein extracts[26] (lanes 1, 2) or purified mitochondria[27] (lanes 3, 4) were run in duplicate SDS-polyacrylamide gels. Proteins in one gel were stained with Coomassie blue, whereas those in the second gel were transferred to nitrocellulose paper and probed with hsp60-reactive antiserum as previously described[1]. Raising the copy number of *HSP60* by including the gene on a multi-copy plasmid increases the cellular level of hsp60-specific immunoreactive protein. Relative molecular mass standards included on the stained gel (not shown) showed the immunoreactive material to be of M_r 64K, in agreement with our previous analyses[1,2]. Thus, there is a discrepancy between the apparent M_r of hsp60 determined by polyacrylamide gel electrophoresis and the value predicted by the nucleotide sequence of the gene (61 K including the putative mitochondrial targeting peptide). *b*, Steady state levels of *HSP60* mRNA in normal and heat-stressed conditions. Strain aW303 (lanes 1, 3) or the same strain transformed with YEpHSP60 (lanes 2, 4) were grown to mid-log phase at 25 °C. The cultures were then divided and grown for a further 2 hours either at 25 °C (lanes 1, 2) or 39 °C (lanes 3, 4). Total nucleic acids were extracted[28], denatured with glyoxal[29], and separated by agarose gel electrophoresis. Nucleic acids were transferred to nitrocellulose filters and analysed by Northern blotting, using the 3.0-kb fragment shown in Fig. 1*a* as a radiolabelled probe. The probe hybridizes to a single RNA band of 1.9 kb (RNA relative-molecular mass standards not shown). The concentration of this mRNA is two to three times higher in the heat-shocked cells than in the non-stressed control. Raising the copy number *HSP60* increases the steady-state level of the 1.9-kb mRNA at 25 °C, and heat-shock induction is again observed. The high M_r band seen in lanes 2 and 4 is due to hybridization of the probe to DNA.

Comparison of the *HSP60* and *groEL* products reveals 54 per cent amino-acid identity, given five small insertion/deletions, whereas comparison with RBP reveals 43 per cent identity including four insertion/deletions (Fig. 4). Regions of similarity are distributed evenly throughout the lengths of the proteins; one exception occurs at the carboxyl terminus, where the repeated Gly-Gly-Met motif is conserved in both hsp60 and groEL, but not in RBP. Hsp60 contains an amino-terminal extension of ~22 amino acids which is not represented in two other members of this gene family. This sequence is characteristic of most mitochondrial targeting peptides[16] in that it contains five basic and no acidic residues, and contains a total of six hydroxylated residues. The presence of this targeting sequence is consistent with the mitochondrial location of hsp60 (refs 1, 2).

One-step gene disruption[17] was used to construct an allele of *HSP60* which is inactive because of insertion of the *HIS3* gene (Fig. 1). The diploid strain a/αW303∇HSP60 was constructed with one wild-type allele and one null allele designated *hsp60::HIS3*. This strain is homozygous *his3⁻*, so the wild-type and null alleles of *HSP60* can be scored by histidine auxotrophy and prototrophy, respectively. Following dissection of tetrads derived from a/αW303∇HSP60, only two of the four meiotic products from each ascus formed colonies on non-selective medium; replica plating revealed that all surviving progeny required histidine and thus had received the wild-type allele. Because no haploid cells containing *hsp60::HIS3* form colonies, we conclude that *HSP60* is essential for cell viability in yeast. Cells were grown at 30 °C, thus the requirement for *HSP60* is not limited to conditions of heat stress.

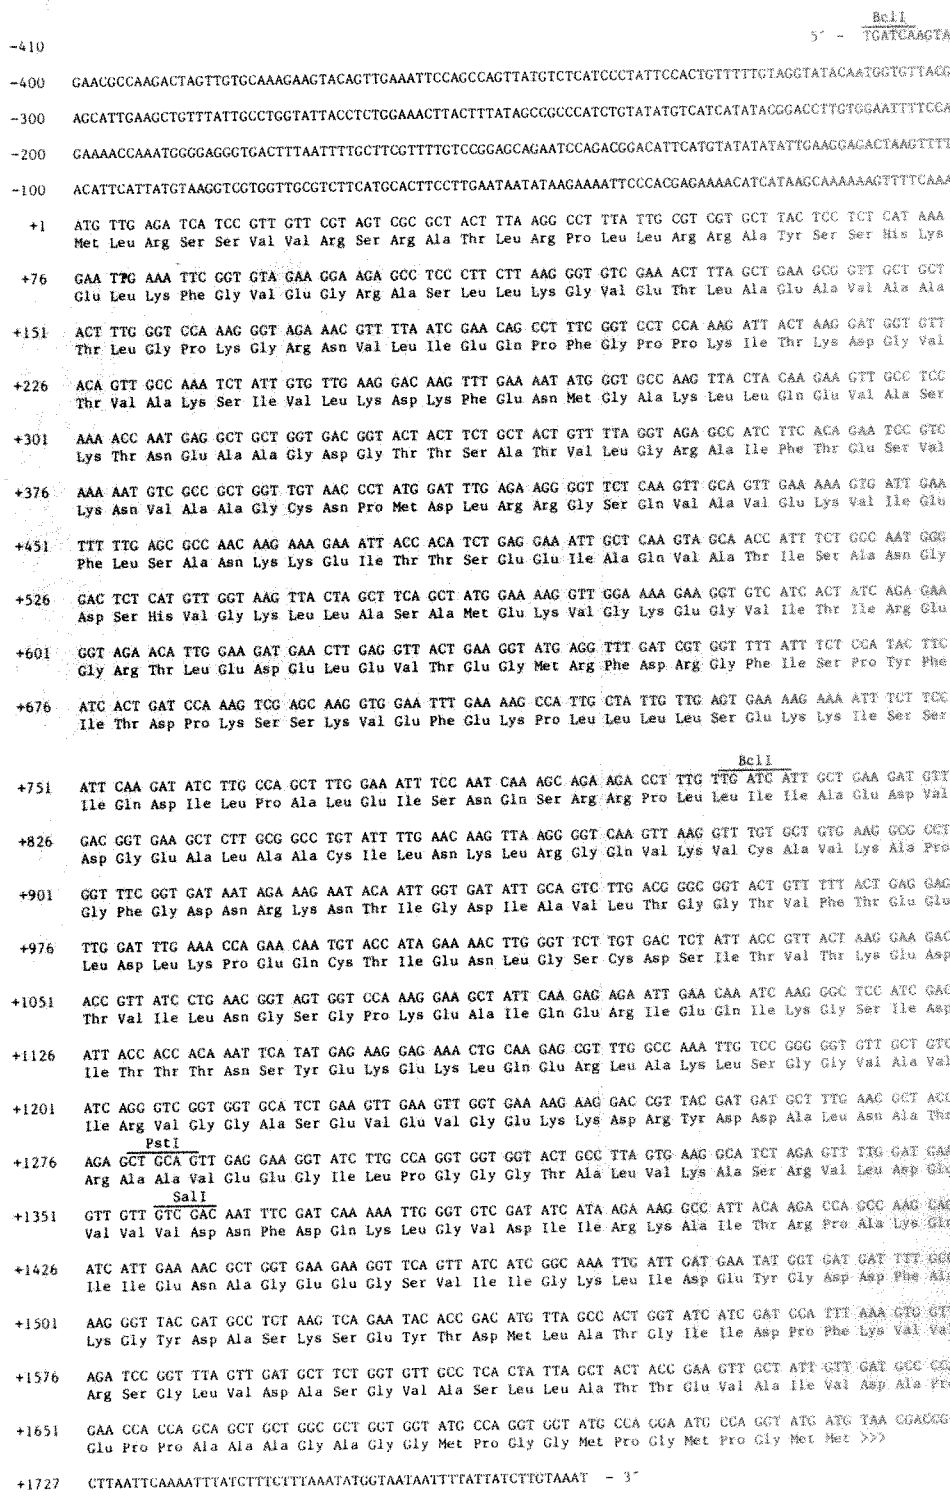

Fig. 3 Nucleotide sequence of the *S. cerevisiae* gene *HSP60*. The predicted amino-acid sequence of the hsp60 protein is indicated. The locations of *Bcl*I, *Pst*I and *Sal*I recognition sites are indicated for reference to Fig. 1.

Methods. The primary source of DNA for sequence analysis was the 5.3-kb *Eco*RI fragment shown in Fig. 1. Segments of this fragment were subcloned into pUC118 or pUC119 and sequenced by the chain-termination method[24]. Subfragments for sequence analysis were generated by exonucleolytic digestion with *Bal*31 and recloned into pUC vectors. The sequences of both DNA strands were determined, and all restriction sites used for subcloning were crossed.

Cheng *et al.*[8] have described a conditional-lethal mutation of yeast, *ts143*, which at non-permissive temperature prevents assembly of multimeric enzymes within mitochondria. To determine whether this assembly defect was due to alteration of hsp60 we tested for allelism between *ts143* and *hsp60::HIS3*. Complementation of the two mutations was assayed directly in dipolids as follows. The *ura3*$^-$/*ura3*$^-$ diploid a/αW303∇HSP60 was transformed with YEpHSP60; in subsequent manipulations the presence of extrachromosomal *HSP60* is marked by the *URA3* gene of the plasmid. Tetrad dissection gave haploids containing either functional *HSP60* or the null allele *hsp60::HIS3*, along with extrachromosomal YEpHSP60. Each type of haploid was mated to a strain containing *ts143* and diploids were selected by complementation of auxotrophies. As expected, the *HSP60/ts143* diploid frequently lost YEpHSP60 during mitotic growth, and these uracil-requiring segregants were viable at non-permissive temperature. In contrast, 100 per cent of mitotic segregants from a *hsp60::HIS3/ts143* diploid grown at non-permissive temperature were uracil prototrophs and thus contained extrachromosomal copies of *HSP60*. Therefore, *hsp60::HIS3* and *ts143* do not complement one another and, by definition, are located in the same genetic element. Using a different genetic approach Cheng *et al.*[8] independently have shown that *ts143* is an allele of *HSP60*.

Hsp60 is the second member of the heat-shock regulon shown to be required for biogenesis of mitochondrial enzymes; hsp70 proteins were recently shown to provide an 'unfolding' function necessary for translocation into both mitochondria and the

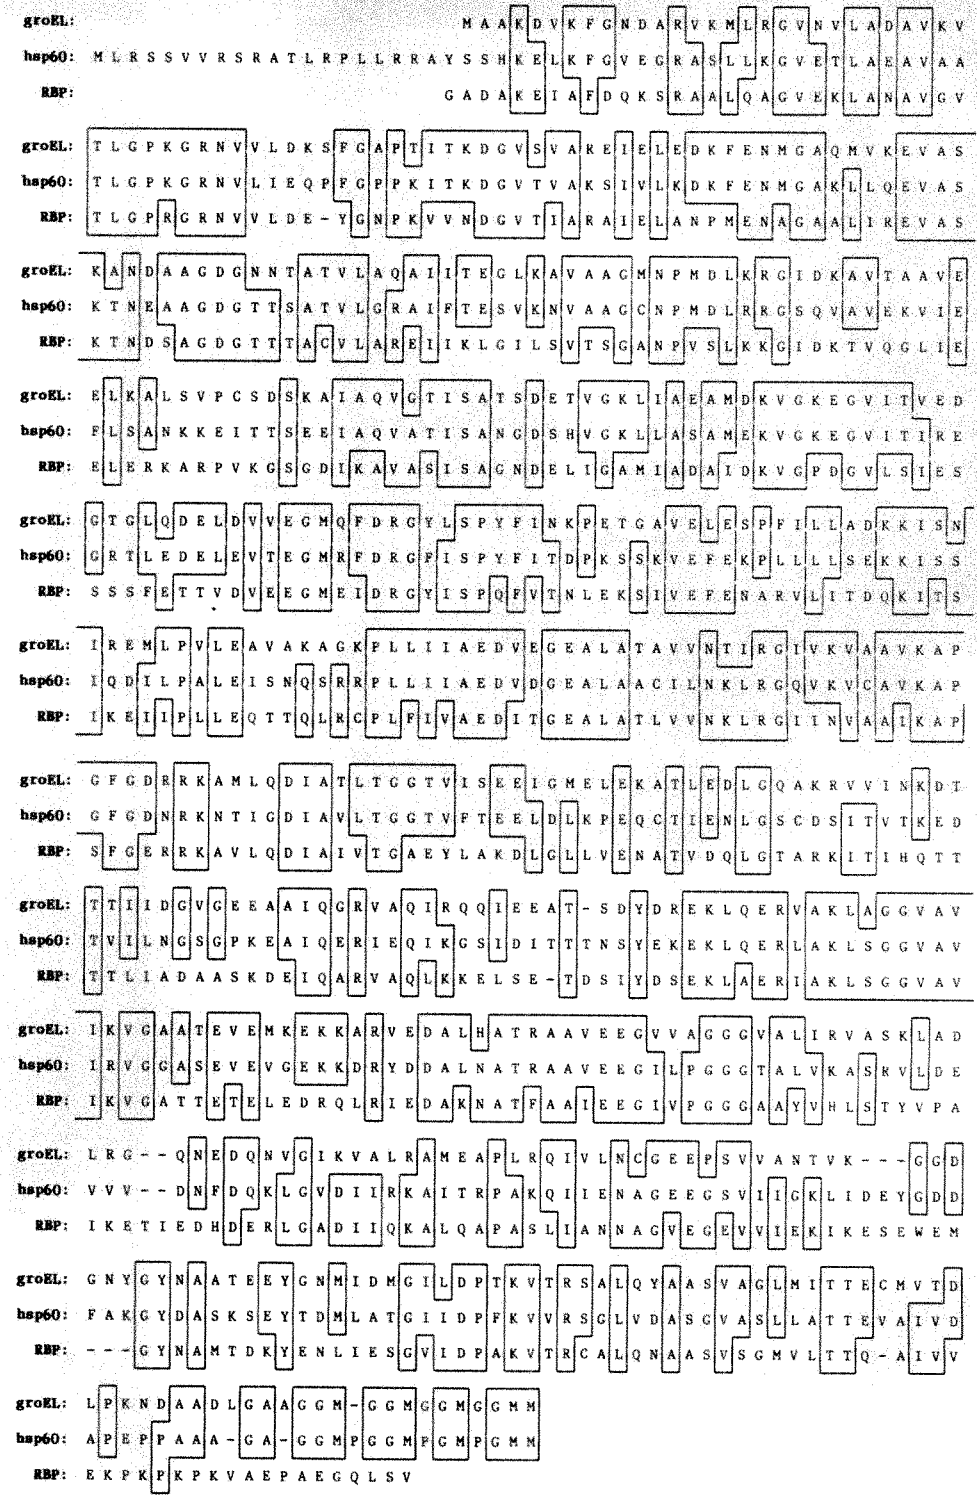

Fig. 4 Primary sequence alignment of yeast mitochondrial hsp60 with *E. coli* groEL and wheat RBP. The predicted amino-acid sequence of the *HSP60* gene product was aligned with the predicted sequences of the groEL and RBP proteins[7] using the MFALGO program[25]. Residues shared between hsp60 and either groEL or RBP are boxed.

lumen of the endoplasmic reticulum[18,19]. Thus, proteins with the ability to influence higher-order structure of various mitochondrial polypeptides are located on both sides of the organelle membrane. The accumulating evidence suggests that such 'unfoldase/refoldase' proteins are widely distributed in prokaryotic and eukaryotic cells.

We thank A. Horwich for supplying the *ts143* strain α143-3A and for communicating results before publication, and E. Hallberg for technical assistance. This research was supported by the NIH, the Department of Energy and the NSF.

Thyroid hormone (T3) binds to a nuclear receptor protein which egulates gene expression by binding to specific DNA sequences ear hormone-responsive genes[1]. Proteins encoded by two cellular roto-oncogenes, c-*erb*A α and β, bind T3[2,3] and can act as unctional T3 receptors[4,5]. In rats, alternative splicing of the -gene transcript generates at least two distinct protein products, ermed r-erbAα1 and r-erbAα2[5-7]. Although these proteins bind o the same DNA sequence, r-erbAα2 does not bind T3. We show ere that expression of r-erbAα2 inhibits the T3-dependent induc- ive effect of either r-erbAβ or r-erbAα1 on expression of a T3-responsive test gene. Alternative splicing of the *erb*Aα tran- cript thus generates products with opposing biological activities, uggesting a novel mechanism for the modulation of hormonal esponsiveness.

The structures of the r-erbAβ, r-erbAα1 and r-erbAα2 proteins studied here are shown schematically in Fig. 1. The human choriocarcinoma cell line JEG-3 was chosen to assess the biological activity of these proteins using contransfections of appropriate expression vectors with a T3-responsive test plasmid. As is the case with COS[4,8] and HeLa[5] cells, the addition of functional T3 receptors to JEG-3 cells by transient transfection results in a gain of hormonal responsiveness.

In the test plasmid pTK14AA, two tandem copies of a modified version of the rat growth hormone (rGH)T3-response element (TRE)[4,8] are inserted just upstream of the herpes simplex virus thymidine kinase (TK) promoter in a chloramphenicol acetyltransferase (CAT) vector[9]. As an internal control, all cotransfections also included pTKGH, in which the TK promoter directs expression of human growth hormone (hGH)[10]. Neither CAT nor hGH expression was affected by T3 when JEG-3 cells were cotransfected with just these two plasmids. CAT expression was, however, specifically induced by about 10-fold by T3 if cotransfections also included either of the r-erbA expression vectors pCDMβ or pCDMα1 (Fig. 2).

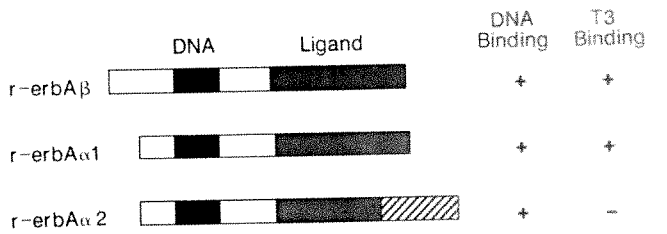

Fig. 1 Schematic representation of r-erbAα1, r-erbAα2 and r-erbAβ deduced protein sequences. DNA- and hormone-binding domains are assigned on the basis of sequence similarities with steroid receptors, and DNA- and T3-binding capacities are indicated. r-erbAα1 contains 410 amino acids, r-erbAα2 contains 492 and r-erbAβ contains 461. r-erbAα1 and r-erbAα2 are identical in their first 370 amino acids, but then diverge completely. The N-terminal regions of r-erbAα1 and r-erbAβ show no apparent similarity, whereas the putative DNA- and ligand-binding domains show 88% and 82% amino-acid identity, respectively. The βcDNA used here has been described previously[4]. The α1 cDNA used[6] is essentially identical to one isolated from rat brain[20]. The α2 cDNA used[6] is essentially identical to cDNAs isolated from rat heart[5] or brain[7], that encode proteins that do not bind T3 or its analogues. The *in vitro* translated products of all three rat erbA proteins bind specifically to the rGH TRE[5,6,21] which is also bound by T3 receptors partially purified from rat liver[22,23]. r-erbAα2 is very similar to proteins encoded by cDNAs isolated from human testis[24] and other tissues[25] which, however, are reported to bind T3. This discrepancy in hormone binding may be a consequence of several amino-acid differences in the C-terminal extensions of the rat and human proteins[26].

Cotransfection with the α2 expression vector pCDMα2 did not have a strong effect on either of the TK promoter plasmids, with or without T3. The vector pCDMα2 did, however, have a striking inhibitory effect on T3-induced expression when cotransfected with pCDMβ. Cotransfection of 5 μg pCDMα2 with 1 μg pCDMβ reduced CAT expression in the presence of T3 to nearly basal levels. α2 was a somewhat less potent inhibitor of the T3 response conferred by α1: addition of 5 μg pCDMα2 to 1 μg pCDMα1 lowered CAT expression in the presence of T3 by about 50%. A T3 dose-response study showed that the inhibitory effect of α2 was not due to an alteration in the affinity of the active T3 receptors for T3. Similar inhibitory effects of pCDMα2 were also observed in transfections of CV-1 cells.

pCDMα2 had no effect on the expression of a test plasmid analogous to pTK14AA but containing a mutant TRE. pCDMα2 also did not inhibit dexamethasone induction of a mouse mammary tumour virus promoter/CAT test plasmid when cotransfected with a glucocorticoid receptor expression vector. Thus, the inhibitory effect of α2 requires a functional TRE, and is specific for the T3 receptor.

As measured by T3 binding capacity, levels of receptor expression directed by pCDMβ and pCDMα1 were similar, and were not affected by cotransfection with pCDMα2. Nuclei of populations of JEG-3 cells transfected with either pCDM or pCDMα2 bound 9.8 fmol T3 per 100 μg DNA, confirming the inability of r-erbAα2 translated *in vitro* to bind T3[5-7]. In transfections with pCDMα1, T3 binding increased to 25.1 fmol per 100 μg DNA, and this level was unaltered by cotransfection with a fivefold excess of pCDMα2 (24.6 fmol T3 per 100 μg DNA). Nuclear T3 binding following transfection with pCDMβ was 21.3 fmol per 100 μg DNA, and 21.8 fmol per 100 μg DNA when cotransfected with a fivefold excess of pCDMα2. Assuming that <10% of the cells are transfected, these results indicate that T3 receptor levels increase by more than 20-fold in cells transfected with either pCDMβ or pCDMα1.

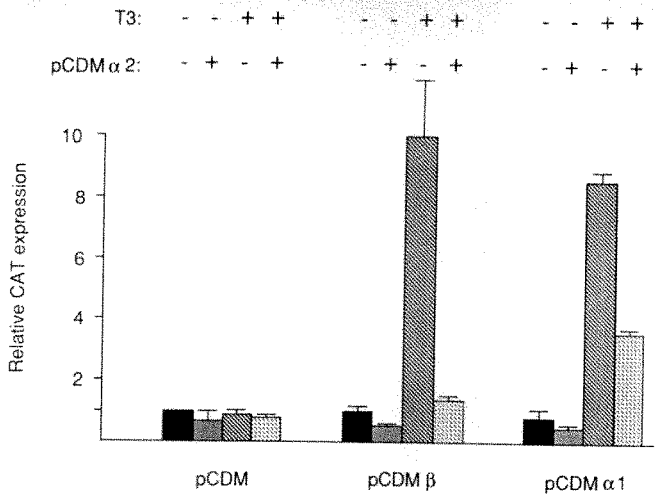

Fig. 2 r-erbAα2 inhibits T3 induction mediated by r-erbAβ or r-erbAα1. JEG-3 cells were cotransfected using $CaPO_4$ as described[4], with both 4 μg pTK14AA and 2 μg pTKGH, plus either the mammalian expression vector pCDM[27] or the indicated combinations of its r-erbA expressing derivatives. Northern blots showed that JEG-3 cells express a low level of both α1- and β-type mRNAs, but no α2-type mRNA, and confirmed that transfected cells contained levels of CDM-derived α2-mRNA comparable to the levels of CDM-derived β-mRNA present in cells transfected with pCDMβ. As observed with COS[4,8] and HeLa[5] cells, the endogenous JEG-3 receptors have no apparent effect on the activity of hormone-responsive test promoters. As results with pituitary cells suggest a correlation between the magnitude of the T3 response and receptor number[8], the lack of T3 effect may simply be a consequence of the low level of endogenous receptors. Transfections included 1 μg pCDMβ or pCDMα1, with or without 5 μg pCDMα2. pCDM was added where necessary to achieve a total of 6 μg of pCDM-based plasmids per transfection. pCDMβ is a derivative of a previously described r-erbAβ expression vector[4] containing a deletion removing all upstream AUG codons preceding the open reading frame. pCDMα1 contains a 1,799-base pair (bp) fragment beginning 13 bp upstream of the r-erbAα1[11] open reading frame, and pCDMα2 contains a 1,947-bp fragment starting at the same position and including the r-erbAα2[6] open reading frame. pTK14AA is a derivative of the CAT expression vector pUTKAT3 (ref. 9), and contains two tandem copies of a modified version of the T3 response element from the rGH gene[4,8] inserted just upstream of the TK promoter. In the internal control plasmid pTKGH[10], the TK promoter directs human growth hormone (hGH) expression. Relative CAT expression is presented in comparison to that measured in cells cotransfected with pTK14AA, pTKGH and pCDM (no *erb*A-expressing plasmids) and cultured in the absence of T3, arbitrarily defined as 1. To facilitate comparison between transfections, expression was normalized by dividing CAT activities by hGH levels as previously described[4,8,22,28].

Methods. Cells were cultured in DMEM with 10% fetal bovine serum. To measure hormone response, individual $CaPO_4$ precipitates were split into equal parts and used to transfect two plates, which were then cultured in media containing either 10% fetal bovine serum depleted of T3 using charcoal, or the same media supplemented with 5 nM T3. All such media were also supplemented with 100 nM dexamethasone. Growth of JEG-3 cells is not affected by these changes in T3 levels. After two days, CAT activity was measured in cell lysates and hGH levels were measured in media, as previously described[4]. hGH expression was essentially independent of T3 or cotransfected *erb*A plasmids, with typical concentrations ranging from 10–40 ng hGH per 100 μl media, although there was, on average, a slight decrease (approximately 30%) in hGH expression by cells transfected with functional receptors and cultured in the presence of T3. Chloramphenicol acetylation was between 1–5% for cells cultured −T3, and dilutions were made when necessary to maintain acetylation <50% for +T3 cultures. The results are the mean ±s.e.m. for three separate experiments, each consisting of transfections of two pairs of plates for all combinations of *erb*A-expressing plasmids.

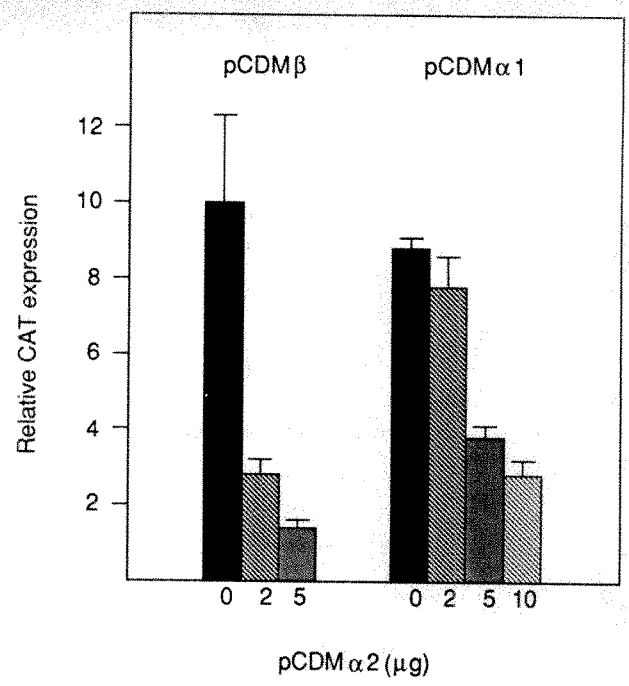

Fig. 3 pCDMα2 inhibits T3-induced CAT expression in a dose-related way. JEG-3 cells were cotransfected with 4 μg pTK14AA, 2 μg pTKGH, 1 μg of either pCDMβ or pCDMα1, and the indicated amounts of pCDMα2. Results represent relative CAT expression of cells cultured in the presence of 5 nM T3, in comparison with CAT expression of cells cotransfected with CDM alone in the absence of hormone. The experimental protocol was as described for Fig. 2.

In a dose-response study, a twofold excess of pCDMα2 ove pCDMβ decreased T3-induced CAT expression by approxi mately 70%, but higher doses of pCDMα2 were required fo similar inhibition of pCDMα1 (Fig. 3). Thus, β is more sensitiv than α1 to the inhibitory effect of α2.

To determine whether α2 had an inhibitory effect in T responsive cells, the GH4C1 rat pituitary cell line was cotransfec ted with two different rGH promoter test plasmids and increasin doses of pCDMα2. GH4C1 cells express functional T3 recep tors, and contain r-erbAα1, r-erbAβ and r-erbAα2 mRNAs[6,11] Increasing amounts of pCDMα2 strongly inhibited the relative T3 induction of the test plasmid prGH14A[8], containing the modified rGH TRE inserted upstream of the rGH promoter. As expected, prGH16A[8], which contains a deletion specifically removing the TRE, did not respond to T3 in the presence o absence of cotransfected pCDMα2.

We conclude that r-erbAα2 can inhibit T3 responses generatec by r-erbAβ and r-erbAα1. Several mechanisms could accoun for this effect: α2 could compete with the functional receptors for binding to the TRE, or could bind to the functional receptors to form inactive heterodimers or hetero-oligomers, or could compete for binding to some accessory factor required for receptor function. Given the range of ligands for the hormone receptor superfamily[12], it is interesting to speculate that the inhibitory effect of α2 could be modulated by binding of an unidentified ligand.

One specific biological role for the variant r-erbAα2 protein is suggested by the large amount of α2 mRNA in adult rat brain[6]. Although that organ has significant levels of T3 receptors, it does not respond to the hormone as judged by classic criteria[13–15]. Thus, high levels of α2 may interfere with T3 effects on expression of some genes in the brain.

Inhibition of hormone action by a splicing variant of a receptor is a novel way to modulate response. Opposing effects on gene expression have also been observed for alternatively spliced

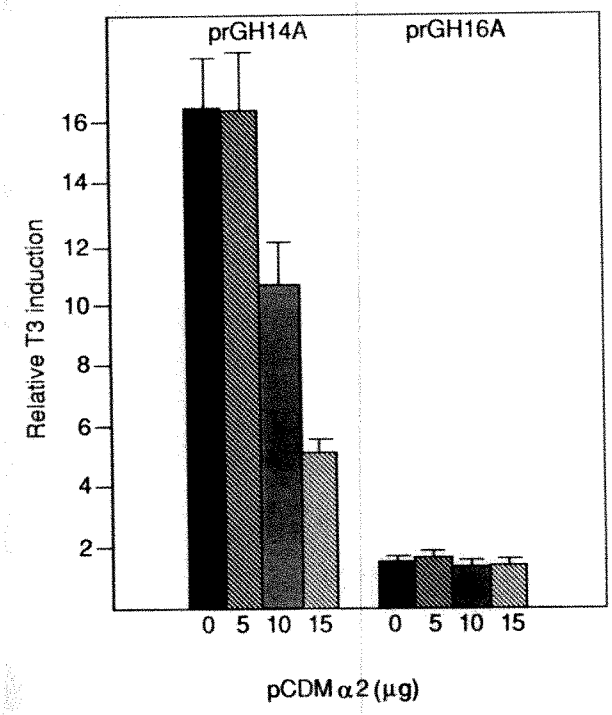

Fig. 4 pCDMα2 inhibits the activity of the endogenous T3 receptors in rat pituitary cells. GH4C1 cells were transfected using $CaPO_4$ as described[22], with 5 μg of the CAT expressing test plasmid, 3 μg of the hGH-expressing internal control plasmid, and the indicated amounts of pCDMα2. In all transfections pCDM was added as necessary to make a total of 15 μg of CDM derived plasmid per plate. Results are expressed as relative T3 induction, determined with prGH14A or pRGH16A cotransfected with pCDM, in the presence and absence of T3. prGH14A and prGH16A have been described[12] and are, respectively, derivatives of the minimal rGH promoter vector pRGH137 (refs 22, 28) containing oligonucleotide inserts of either the modified rGH TRE[4] or an inactive deletion mutant[8]. Cells were incubated and CAT and hGH were assayed as described in the Fig. 2 legend, except that the medium was Ham's F10.

products of viral genes[16,17], and recent results suggest that alternative splicing may generate diversity in the CTF/NF-1 (CCAAT-binding transcription factors/nuclear factor I) class of mammalian transcription factors[18,19]. Expression of transcription factors with different functions by alternative splicing may be an important general regulatory mechanism.

We thank Robert Warne and John Harney for help with transfections. This work was supported in part by a grant from Hoechst AG to Massachusetts General Hospital. G.A.B. is supported by Physician Scientist Award from the NIH.

Prolonged activation of *jun* and collagenase genes by tumour necrosis factor-α

David A. Brenner*, Maureen O'Hara*, Peter Angel†, Mario Chojkier* & Michael Karin†

Departments of Medicine* and Pharmacology†, University of California at San Diego, School of Medicine and VA Medical Center, La Jolla, California 92093, USA

Tumour necrosis factor-α (TNF-α) is secreted by macrophages in response to inflammation, infection and cancer[1]. Sublethal doses of recombinant TNF-α to rats causes cachexia, anaemia and inflammation[2]. TNF-α plays a major part in tissue inflammation[3] and remodelling[4] by stimulating production of collagenase. Cellular responses to TNF-α are initiated by binding to high-affinity cell surface receptors[5,6]. TNF-α then profoundly affects gene regulation, stimulating the *fos*, *myc*, interleukin-1 and interleukin-6 genes[7–9] and inhibiting the type I collagen gene[10]. Here we demonstrate that TNF-α also stimulates collagenase gene transcription; this stimulation is mediated by an element of the gene that is responsive to the transcription factor AP-1, the major component of which (jun/AP-1) is encoded by the *jun* gene; and that TNF-α stimulates prolonged activation of *jun* gene expression. This prolonged induction of *jun* contrasts with its transient activation by the phorbol ester TPA and provides a physiological example of the ability of jun/AP-1 to stimulate its own transcription[11]. This may be a key mechanism for mediating at least some of the biological effects of TNF-α.

Addition of TNF-α to confluent human fibroblasts causes specific induction of collagenase messenger RNA (Fig. 1*a*). In these cells TNF-α does not stimulate incorporation of [^{3}H]thymidine[10], which enables us to dissociate stimulation of gene expression from a mitogenic effect. Collagenase mRNA can also be induced by TPA (12-*O*-tetradecanoylphorbol-13-acetate)[12], but not by other effectors of signal transduction, including Ca^{2+} ionophores, cyclic AMP, prostaglandins or arachidonic acid (data not shown).

Inhibition of protein synthesis (95%) by cycloheximide (0.1 mM) blocks the induction of collagenase mRNA by TNF-α (Fig. 1*b*, lane 3). By itself cycloheximide leads to low-level induction, probably by stabilizing collagenase mRNA (Fig. 1*b*, lane 4) and is not toxic to the cells. Thus *de novo* protein synthesis appears to be required for prolonged activation of collagenase gene expression by TNF-α. Transcriptional run-off assays using isolated nuclei indicate that TNF-α increases collagenase gene transcription fourfold, but that it has no effect on activity of the constitutively expressed α-tubulin gene (Fig. 1*c*). This increased collagenase gene transcription therefore apparently accounts for induction of collagenase mRNA by TNF-α.

Chimaeric plasmids containing segments of the collagenase 5′ flanking region ligated to the chloramphenicol transferase (*CAT*) gene were used to identify the TNF-α-responsive *cis*-acting element. CAT activity was first assayed in HepG2 cells, which are efficiently transfected[12] and respond to TNF-α[13]. TNF-α stimulates expression of constructs containing collagenase sequences from −1,200 to +63 or from −517 to +63

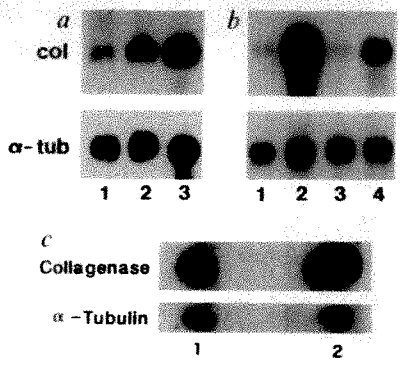

Fig. 1 Analysis of the effects of TNF-α on collagenase gene expression. *a*, Confluent primary human AF2 fibroblast cultures were incubated with human recombinant TNF-α (AmGen) (0.6 nM) for 0, 6 or 24 h (lanes 1, 2 and 3 respectively). Blots of RNA extracted from these cells were hybridized to radiolabelled complementary DNA probes of human fibroblast collagenase[12] (col) or human α-tubulin (α-tub)[33]. *b*, Confluent AF2 cultures were incubated for 24 h with no additions (lane 1); TNF-α (0.6 nM) (lane 2); TNF-α (0.6 nM) plus cycloheximide (0.1 mM) (lane 3), and cycloheximide alone (0.1 mM) (lane 4) before extraction of total cellular RNA. *c*, Nuclear run-off transcription analysis of TNF-α-stimulated collagenase gene expression in human fibroblast cultures. AF2 fibroblasts were grown to confluence in roller bottles and incubated either without (1) or with (2) TNF-α (0.6 nM) for 24 h. Nuclei were isolated and *in vitro* run-off transcription performed as previously described[9,34]. The ^{32}P radiolabelled nuclear RNA was extracted and hybridized to purified cDNAs that were slot-blotted on to nitrocellulose filters.

Methods. Human fetal AF2 fibroblasts were cultured under an atmosphere of 5% CO_2/95% air in Dulbecco's minimal essential medium (DMEM) containing 10% fetal calf serum. Cells were plated at a density of 9×10^5/P-100 dish and subjected to the various treatments after 6 days. Total cellular RNA was extracted[10]. Purified fragments of collagenase[12] and tubulin[33] cDNAs were radiolabelled with α-^{32}P-dCTP using random-primer synthesis to a specific activity of $\sim1\times10^9$ c.p.m. per μg DNA. Northern blots and slot blots on nylon filters have been described previously[10]. Slot-blot autoradiographs were quantitized by a scanning laser densitometer interfaced with an integrator.

(Fig. 2*a*); these sequences contain the TPA-responsive element (TRE) of the collagenase gene, consisting of eight base pairs (−73 to −65) constituting a binding site for transcription factor AP-1 (refs 12 and 14). TNF-α enhances the activity of constructs containing one or five copies of the TRE upstream of the herpes simplex virus-tk promoter (1×TRE-CAT, 5×TRE-CAT) by threefold and seventeenfold respectively. Neither TNF-α nor TPA stimulates the activity of tk-CAT or of Δ-72 TRE-CAT, which contains a point mutation that interferes with the binding of AP-1 to the TRE[14]. Stimulation of 5×TRE-CAT activity by TNF-α results from increased production of correctly initiated CAT mRNA (Fig. 2*c*). We confirmed these results in primary human fibroblasts, which are physiologically more relevant, but also more refractory to transfection[15]. TNF-α and TPA also stimulate CAT activity from 5×TRE-CAT, but not from tk-CAT (Fig. 2*b*), as expected. Therefore an intact AP-1 recognition sequence is necessary and sufficient for induction of CAT activity by both TNF-α and TPA in either HepG2 cells or primary human fibroblasts.

As induction of collagenase by TNF-α is dependent on *de novo* protein synthesis, we investigated whether this is associated with activation of the *jun* gene that encodes the main component of purified AP-1 known as jun/AP-1 (refs 16–18). Incubating fibroblasts with TNF-α results in prolonged induction of *jun* mRNA lasting at least six hours (Fig. 3*a*). However, the effect of TNF-α on *jun* transcription is reversible, and by 24 hours *jun* mRNA returns to its basal level (data not shown). In contrast, TPA treatment results in a more transient increase in the *jun* mRNA level, with maximum stimulation after 1 h

(*a*) CAT activity in HepG2 cells

Construct	Control	TPA	TNF-α

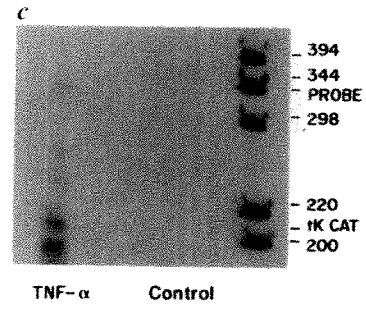

Fig. 2 Stimulation of genes containing collagenase gene segments by TNF-α. The effect of TPA and TNF-α on the chloramphenicol acetyl transferase activity of transiently transfected HepG2 cells (*a*) or AF2 primary human fibroblasts (*b*). Supercoiled plasmids (tk-CAT, −1,200/+63 collagenase-CAT, −517/+63 collagenase-CAT, 5×TRE-CAT, and Δ-72 TRE-CAT) were introduced into HepG2 cells[12] and into primary human fibroblasts using the Chen-Okayama method[15]. The cells were then incubated for 13 h either with no additions, or with TPA (20 ng ml^{-1}) or TNF-α (0.6 nM), and assayed for CAT activity[12,35]. CAT activity is expressed as per cent acetylation of chloramphenicol and represents the mean of triplicate experiments. *c*, RNase protection analysis of collagenase-CAT mRNA. HepG2 cells were transfected with 5×TRE-CAT and incubated with no additions (control) or with TNF-α (0.6 nM). Isolated total RNA (20 μg) was hybridized with 5×10^5 c.p.m. radiolabelled SP6 RNA probe[36] and digested with RNases[14]. Size markers (in base pairs) are shown to the right.

(Fig. 3*a*). Induction of *jun* mRNA by TNF-α is not blocked by cycloheximide (Fig. 3*b*), implying it does not require *de novo* protein synthesis.

As the fos protein interacts with jun/AP-1 to form a more effective transcriptional activator operating through the AP-1 binding site[18,19], we determined the effect of TNF-α on *fos* mRNA levels in these cultured fibroblasts. TNF-α or TPA ellicit a rapid and transient induction of *fos* mRNA, with virtually no *fos* mRNA being detectable by 2 h (Fig. 3*a*). The increase in *jun* and *fos* mRNA is paralleled by an increase in immunoprecipitable jun/AP-1 and fos protein synthesis (data not shown). Therefore, TNF-α stimulates the expression of both *fos* and *jun* genes, whose products interact to stimulate transcription of AP-1-responsive genes.

Most of the known effects of phorbol esters, including stimulation of gene transcription, are mediated by activation of protein kinase C (PKC)[20–22]. Activated PKC associates in a Ca^{2+}-independent manner with the plasma membrane to phosphorylate membrane proteins[21]. Two independent PKC assays demonstrated that plasma membrane-PKC activity is stimulated by incubating the fibroblasts with either TPA or TNF-α (Fig. 4). In addition, the PKC inhibitor H7 (ref. 23) inhibits induction of collagenase mRNA by either TPA or TNF-α. But prolonged coincubation with TNF-α and H7 is associated with some cel-

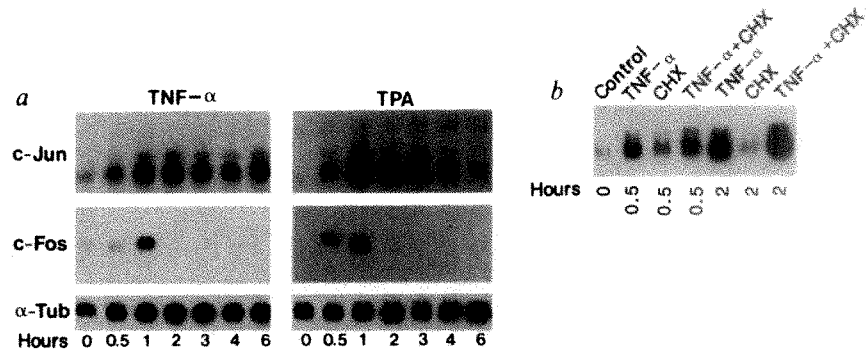

Fig. 3 Northern blot analysis of the effects of TNF-α and TPA on *jun* and *fos* expression. *a*, Confluent AF2 cultures were incubated with TNF-α (0.6 nM) or TPA (20 ng ml^{-1}) for 0, 0.5, 1, 2, 3, 4 or 6 h after which total cellular RNA was extracted. Blots of RNA from these cells were hybridized to radiolabelled *jun*[14] or α-tubulin[33] cDNA probes. *b*, Confluent AF2 cultures were incubated either with no additions (control) with TNF-α (0.6 nM), with cycloheximide (CHX; 0.1 mM) or with TNF-α (0.6 nM) plus cycloheximide (0.1 mM) for 0, 0.5 or 2 h. RNA blots were hybridized to a *jun* cDNA probe.

lular toxicity (data not shown). We conclude that like TPA, TNF-α activates PKC which in turn may result in increased AP-1 activity and induction of AP-1-responsive genes.

Epidermal growth factor[24] and serum[25] have been shown to cause transient induction of *jun* mRNA in immortal cells undergoing mitosis, which differs from the prolonged activation of gene expression in quiescent primary human fibroblast cultures shown here. Such cells are likely to reflect one of the natural targets for TNF-α action. The stimulation of *jun* and collagenase gene expression by TNF-α is prolonged in comparison to the more transient effect of TPA[11,26]. On the other hand, the kinetics of *fos* activation by both agents are identical. It is possible that TNF-α does not lead to subsequent down-regulation of PKC as rapidly as TPA (ref. 22). The *jun* gene product stimulates the transcription of its own gene through an AP-1 binding site in the *jun* promoter[11]; under certain circumstances, this positive autoregulatory mechanism could lead to subsequent prolonged stimulation of *jun* expression. It has been proposed that the autostimulatory activity of the *jun* gene plays a key part in converting transient signals generated by occupied cell surface receptors to long-lasting effects on cellular gene expression[22,27,28], a proposition which is supported by our results.

An apparent paradox is that a 'tumour necrosis factor' stimulates the expression of proto-oncogenes. In reality, TNF-α has a variety of effects on cell proliferation, including to act as a growth factor for normal fibroblasts[29] in both normal[30] and transformed[31] B cells. Bacterial extracts, such as *Bacillus Calmette-Guerin* cell-wall preparations, that stimulate TNF-α production can actually enhance tumour growth[32]. Perhaps these proliferative responses result from the stimulation of proto-oncogene expression by TNF-α.

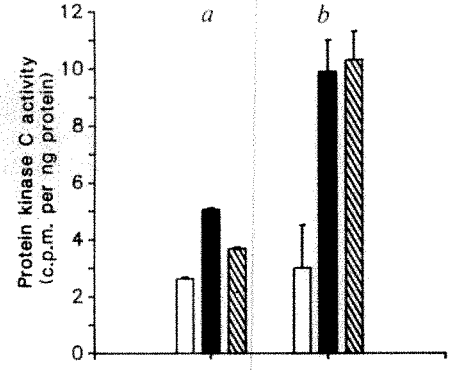

Fig. 4 Stimulation of protein kinase C activity in human fibroblast plasma membranes. Confluent AF2 cultures were incubated with no additions (control; open bars), with TPA (filled bars) or TNF-α (cross-hatched bars). Two different assays demonstrated specific activation of PKC based on its requirement for phospholipids (*a*) or its inhibition by H7 (*b*).

Methods. Confluent AF2 cells (5.6×10^6) were incubated in DMEM containing 10% fetal calf serum for 30 min at 37 °C with no additions (control) or with either TPA (20 ng ml^{-1}) or TNF-α (1.2 nM). Cells were lysed and the plasma membrane fraction purified by centrifugation at 100,000*g*. PKC was extracted from plasma membrane in 20 mM Tris, *p*H 7.5, 0.33 M sucrose, 0.5 mM EGTA, 2 mM EDTA, 2 mM PMSF and 1% NP40 and its activity determined using histone III-S as a substrate for phosphorylation[20,22]. *a*, Specific PKC activity represents ^{32}P c.p.m. incorporated into histone in the presence of phospholipids (0.9 mM diolein and 0.5 mg ml^{-1} phosphatidyl serine), minus that incorporated in their absence. *b*, Specific PKC activity represents ^{32}P c.p.m. incorporated into histone in the presence of phospholipids alone, minus that incorporated after the addition of the PKC inhibitor H7. Values represent mean ±s.e.; $P < 0.02$ for TPA and TNF-α compared with control values.

Involvement of the 'leucine zipper' region in the oligomerization and transforming activity of human c-myc protein

Chi V. Dang, Maura McGuire, Michael Buckmire & William M. F. Lee*

Hematology Division, Department of Medicine, Johns Hopkins University School of Medicine, Baltimore, Maryland 21205, USA
* Department of Radiation Oncology and Medicine, Cancer Research Institute, University of California, San Francisco, California 94143, USA

c-Myc plays a part in the regulation of important cellular processes such as growth, differentiation and neoplastic transformation[1–3]. Although c-*myc* gene structure and expression are well characterized[1–3], the function and biochemical properties of the protein are less well understood[4–6]. Human c-myc is a 439-amino acid phosphoprotein which binds DNA *in vitro* and belongs to a discrete subset of nuclear proteins[1–3]. Using the human c-*myc* mutants generated by linker-insertion and deletion mutagenesis, we have defined regions of the protein that are important for its transforming activities[7] and its nuclear localization[8]. Here, we show that human c-myc exists as an oligomer *in vitro* and use mutant proteins to localize the oligomerization domain to a carboxyl-terminal peptide containing the 'leucine zipper' motif. The 'leucine zipper' describes a structure found in a number of DNA-binding proteins that contains leucines occurring at intervals of every seventh amino acid in a region predicted to be α-helical[9]. The 'leucine zipper' might mediate dimerization by intermolecular interdigitation of the leucine side-chains. We show that a c-myc mutant, which is inactive but can oligomerize, dominantly inhibits the cotransforming activity with wild-type c-myc of rat embryo cells, whereas inactive mutants which cannot oligomerize properly because of deletions in the oligomerization domain are recessive.

To study the characteristics of c-myc, we used bacterially synthesized wild-type and mutant human c-myc in the pOTSmyc plasmid and its derivatives, produced by subcloning c-*myc* fragments containing mutations into the pOTS vector[10] (a gift from R. Watt and A. Shatzman of Smith, Kline and French). Deletion mutants are designated 'D' followed by the positions of the deleted codons. Highly purified wild-type c-myc behaves in gel filtration chromatography as a protein of relative molecular mass (M_r) 200,000 (200K) (Stokes' radius, 4.7 nm) (Fig. 1*a*). The sedimentation coefficient of c-myc is estimated to be 10.5 S by velocity sedimentation in 10–30% glycerol gradients (data not shown). The derived native relative molecular mass of c-myc is 213K, which is consistent with a tetramer[11] (Table 1). The oligomerization of c-myc was also studied by chemical cross-linking (Fig. 1*c*). The dominant cross-linked species has an estimated M_r of 200K by SDS-PAGE, which is also consistent

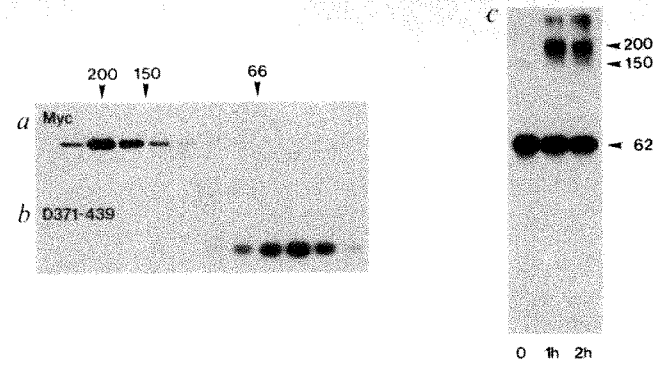

Fig. 1 Immunoblots of fractions from gel filtration chromatography of wild-type and mutant c-myc recombinant proteins. M_r values (K) for marker proteins are shown above the panels *a* and *b*: aldolase (200K), yeast alcohol dehydrogenase (150K) and bovine serum albumin (66K). *a*, The purified wild-type c-myc 62K polypeptide elutes as an oligomer of M_r 200K, whereas a mutant 52K polypeptide that is deleted from amino acids 371–439 is monomeric (*b*). *c*, Immunoblot of glutaraldehyde-cross-linked products of purified c-myc protein. M_rs of polypeptides are shown on the right (K) and incubation times (hours) at the bottom.
Methods. Mutant c-*myc* complementary DNAs in the pOTS vector were generated by subcloning *Bst*EII–*Hin*dIII fragments of mutant c-*myc* cDNAs[7] into a modified pOTSmyc vector. Recombinant wild-type and mutant c-myc protein were purified as described[16]. Protein samples (150 μl) were eluted with TBS at 6.0 ml h^{-1} at 4 °C in a 0.9 × 30 cm Sephacryl S300 (Pharmacia) column. Polypeptides in column fractions (0.5 ml) were immunoblotted after SDS-PAGE[18,19] and visualized with rabbit anti-recombinant-c-myc antibody and ^{125}I-labelled protein A. M_rs of polypeptides were estimated from prestained protein markers (Biorad). *c*, A 0.75 μM solution of purified c-myc protein was incubated with 0.005% glutaraldehyde in 75 mM sodium phosphate buffer, pH 7.0, at 20 °C. Samples were removed at different times, electrophoresed on SDS-polyacrylamide gels and immunoblotted.

Table 1 Estimated M_r and subunit structure of wild-type and mutant c-myc proteins and of staphylococcal protein A/c-myc fusions

Protein*	*s* (S)†	R_s (nm)‡	Native M_r§	Subunit M_r§	Structure
c-myc	10.5	4.7	213,000	62,000	tetramer
D106–143	8.5	4.5	169,000	54,000	tetramer
D371–412	6.2	4.0	107,000	55,000	dimer
D414–433	4.0	3.2	55,000	54,000	monomer
PA[372–439] myc	4.3	4.6	85,000	35,000	dimer
PA[262–326] myc	2.2	3.5	33,000	35,000	monomer
Protein A‖	2.1	5.0	45,000	45,000	monomer

* c-myc mutants are designated 'D' followed by position numbers of the deleted amino acids. Using the one-letter code, the carboxyl-terminal c-myc 72 amino acids are as follows, with the leucines in heptad repeat underlined: 369-ELKRSFFALRDQIPELENNEKAPKVVILKKATAYILSVQAEEQKLISEEDLLRKRREQLKAKLEQLRNSCA. The 'leucine zipper' region includes leucines at residues 413, 420, 427 and 434. Protein A/c-myc fusion proteins are designated by the positions of the included c-myc amino acids in brackets.

† Sedimentation coefficients are estimated from peak fractions of 10–30% glycerol gradients in TBS (10 mM Tris-HCl, pH7, 150 mM NaCl).

‡Stokes' radii.

§ Native M_rs are estimated from the sedimentation coefficients and Stokes' radii using standard hydrodynamic equations[11]. Subunit M_rs are estimated from SDS-polyacrylamide gels (note that c-myc migrates slowly and has a predicted M_r of 49K).

‖ Values are from ref. 13.

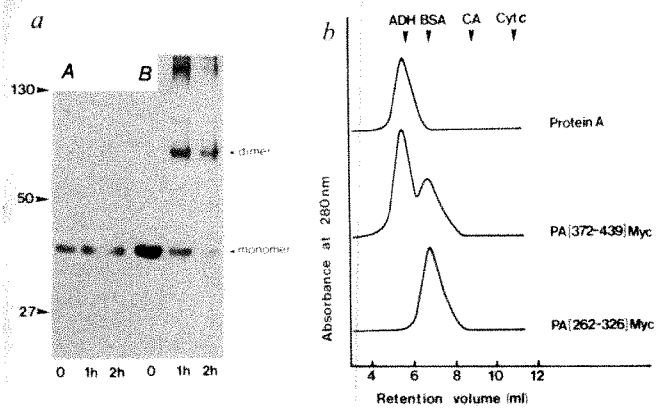

Fig. 2 *a*, Immunoblots of glutaraldehyde-cross-linked products of staphylococcal protein A/c-myc fusion proteins. The included c-myc amino acids are *A*, 262–326, *B*, 372–439. Incubation times are shown below the panels and protein size markers to the left (K). *b*, FPLC gel filtration chromatography of purified protein A/myc fusion proteins using a Superose 12 column (column volume, 25 ml). Positions of marker proteins eluting in order of decreasing Stokes' radius are given at the top: yeast alcohol dehydrogenase (ADH; R_s 4.5 nm); bovine serum albumin (BSA; R_s, 3.5 nm); bovine erythrocyte carbonic anhydrase (CA; R_s, 2.4 nm) and cytochrome *c* (Cytc; R_s, 1.7 nm).
Methods *a*, The fusion genes were constructed using the pRIT2T protein A bacterial expression vector and the fusion proteins were purified as described[12,20]. Purified proteins (1 μM) were treated with glutaraldehyde as in Fig. 1*c*. *b*, Protein samples of 200 μl (1–2 mg ml^{-1}) were injected and eluted with TBS at a flow rate of 0.5 ml min^{-1} (20 °C). Fraction volume was 0.5 ml.

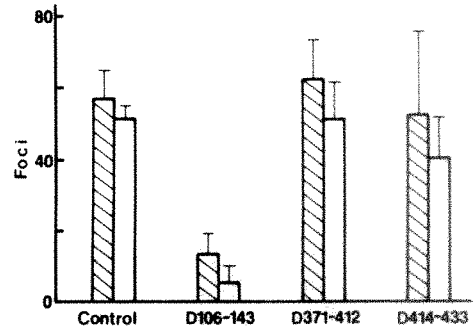

Fig. 3 Effects of defective c-myc mutants on the wild-type c-myc cotransformation activity of rat embryo cells. Rat embryo cells were transfected with EJ*ras* (10 μg) and wild-type c-*myc* (10 μg, cross-hatched; 3 μg, open) plasmids in the absence (control) or presence of various mutant c-*myc* (10 μg) plasmids[7]. The mean numbers of foci per 10^6 transfected rat embryo cells from three separate experiments are given as vertical bars with vertical lines at the top of the bars depicting standard deviations. Mutant c-*myc* plasmids alone do not cotransform rat enbryo cells with EJ*ras* (ref. 7).

with a tetrameric form; minor species migrating with M_r 150K and $M_r > 250$K are also present. The unreacted subunit runs at 62K. Thus by three independent methods, we have found that human c-myc exists as an oligomer *in vitro*.

To test whether loss of the c-myc carboxy-terminal region containing the 'leucine zipper' motif (see Table 1 footnote) prevents oligomerization, we determined the native M_rs of c-myc mutants that are deleted in this region. A mutant protein (D371–439) that is deleted at the C-terminal by 69 residues behaves as a monomeric protein of M_r 50K by gel filtration (Fig. 1*b*). To analyse this region further, we examined the gel filtration characteristics of mutant myc containing smaller deletions. D371–412 yields a 55K protein which has an M_r of slightly less than 150K in the native form, indicating the presence of dimers (Table 1). D414–433 totally disrupts the 'leucine zipper' motif and behaves as a monomeric protein with native $M_r = 55$K (Table 1). As a control, deletion of residues 106–143 (another region required for myc transforming activity[7]) does not affect oligomerization (Table 1). These gel filtration results were confirmed by velocity sedimentation. The intact D371–412 protein sediments at 6.2 S, indicative of a dimer form (Table 1), whereas D414–433 sediments at 4.0 S, indicating that monomers are present (Table 1). Thus, both our gel filtration and velocity sedimentation results indicate that disruption of the 'leucine zipper' motif generates monomeric proteins, whereas disruption of the amino-acid region 371–412, which does not involve the 'leucine zipper', still permits dimerization of myc.

If C-terminal myc amino acids are involved in oligomerization, this region might behave as a discrete functional domain. Therefore we constructed genes that fuse the 28K N-terminal region of staphylococcal protein A to regions of human myc to determine whether the C-terminal c-myc region could promote oligomerization of the hybrid protein[12]. Proteins with c-myc amino acids 262–326 or 372–439 fused to protein A were purified to >95% homogeneity. These proteins are designated PA followed by the included c-myc amino acids in brackets. Cross-linking of these fusion proteins using glutaraldehyde indicates that c-myc amino acids 262–326 do not mediate dimerization of the fusion protein (Fig. 2*a*, panel *A*). In contrast, the fusion protein containing the c-myc 'leucine zipper' yields dimers and oligomers after cross-linking (Fig. 2*a*, panel *B*). We further showed that this region of c-myc promotes oligomerization by subjecting the purified proteins to fast protein liquid chromatography (FPLC) (Fig. 2*b*). Purified protein A (45K) is an asymmetric monomeric molecule with a Stokes' radius of 5.0 nm, in agreement with our observation[13] (Fig. 2*b*). The fusion protein containing the 28K N-terminal segment of protein A and the 'leucine zipper' (PA[372–439]myc) displays two peaks which are consistent with the presence of both dimers and monomers (Fig. 2*b*). The fusion protein containing c-myc amino acids 262–326 exists exclusively as a monomer and elutes at the same position as the smaller monomeric peak of PA[372–439]myc. To confirm the subunit composition of these fusion proteins, native M_rs were estimated from Stokes' radii and sedimentation coefficients (Table 1). These results indicate that the 68 amino acids at the C-terminal of myc can mediate dimerization.

If functional c-myc is multimeric *in vivo*, then an inactive c-myc derivative or *trans*-dominant negative mutant[14] capable of interacting with wild-type polypeptide chains will be inhibitory if it causes the formation of non-functional multimers. We assessed the effects of various inactive c-myc mutants on the ability of wild-type c-myc to cotransform normal rat embryo cells with EJ-*ras* (ref. 7). Inactive mutants that are oligomerization-defective, namely D371–412 and D414–433, are recessive. But the D106–143 mutant, which lacks transforming activity but preserves the oligomerization domain, can dominantly inhibit the transforming activity of wild-type c-myc (Fig. 3). These observations support the *in vivo* significance of c-myc oligomerization and are consistent with a previous report that v-myc is oligomeric in cellular extracts[15]. Although our *in vitro* data indicate the possible existence of c-myc homo-oligomers *in vivo*, the *in vivo* c-myc oligomers could be not dimers or tetramers, but complexed with other proteins like c-jun/c-fos[16,17] for example.

In summary, we have demonstrated that c-myc synthesized in bacteria exists in oligomeric form and that oligomerization depends on the integrity of a C-terminal region containing the 'leucine zipper' motif[9]. When this region is fused to monomeric

protein A, the hybrid protein dimerizes. Another c-myc region containing amino acids 370–384 may play a part in c-myc oligomerization, because its deletion prevents tetramerization but not dimerization. As we have not performed a point mutation analysis on the 'leucine zipper', our results imply, but do not stringently prove, that the leucine repeat is the critical feature in oligomerization. The integrity of the 'leucine zipper' seems to be essential *in vivo*, as it is required for transforming activity[7] and as a defective c-myc mutant with an intact oligomerization domain behaves as a dominant negative mutant. Such a negative mutant provides a new tool to impede the activity of wild-type c-myc.

This study was supported by Biomedical Research (C.V.D.), the American Cancer Society Institutional Research (C.V.D.) and by the NIH (W.M.F.L.). W.M.F.L. holds an American Cancer Society junior faculty research award. C.V.D. is a Hubert and Anne E. Rogers Scholar and W. M. Keck Foundation clinician scientist. C.V.D. thanks J. L. Spivak and J. D. Stobo for their support, W. Landschulz and S. L. McKnight for discussion and P. Agre for use of the FPLC system.

The *Drosophila* fushi tarazu polypeptide is a DNA-binding transcriptional activator in yeast cells

V. Danial Fitzpatrick & C. James Ingles

Banting and Best Department of Medical Research, University of Toronto, Toronto, Ontario M5G 1L6, Canada

Many of the regulatory genes controlling the developmental pattern of segmentation during embryonic development in *Drosophila melanogaster*[1–3] encode nuclear proteins containing either homoeobox or 'zinc-finger' domains with putative[4–6] or demonstrated[7,8] sequence-specific DNA-binding properties. One of these *Drosophila* homoeobox-containing proteins is encoded by the *fushi tarazu* (*ftz*) gene. The expression of *ftz* is spatially restricted during embryogenesis[9–11] and the ftz polypeptide has an important role in different stages of development[12,13]. To determine whether the ftz polypeptide is a sequence-specific DNA-binding activator of transcription, we expressed portions of ftz as fusions with the yeast transcription factor GAL4 in yeast cells. Chimaeric GAL4/ftz proteins, like GAL4 itself, activated the transcription of a GAL4-dependent reporter gene. With reporter constructs containing *Drosophila*-derived chromosomal DNA sequences as transcriptional elements, the ftz polypeptide acted as a sequence-specific DNA-binding transcriptional activator. In *Drosophila*, the ftz product may therefore be a positive regulator of transcription.

b

Transcriptional activator	Transcriptional activity (β-gal units)	
	pDF5	pDF6
G/ftz$^{3-413}$	135	0.7
GAL4/ftz$^{3-413}$	103	0.5
GAL4/ftz$^{\Delta 274-302}$	0.7	<0.5
GAL4	<0.5	<0.5

Fig. 2 Consensus binding sites for ftz in *Drosophila* act as a ftz-dependent UAS element in yeast cells. Transcription of β-galactosidase reporter constructs containing either six tandem repeats (NP6) of a consensus ftz-binding site[8] in *Drosophila* (pDF5) or lacking any UAS element (pDF6) was used to assess transcriptional activation by G/ftz$^{3-413}$, GAL4/ftz$^{3-413}$, the homoeobox deletion mutant GAL4/ftz$^{\Delta 274-302}$, or GAL4 itself. *a*, Reporter constructs. *b*, Transcriptional activation.
Methods. The β-galactosidase reporter construct pDF5 containing six tandem copies of the consensus ftz-binding site TCAATTAAATGA[8] is a derivative of the 2μ *URA3* yeast plasmid pLR1Δ20 (ref. 29), in which the UAS_G DNA between the unique *Sma*1 (S) and *Xho*1(X) sites was replaced by a *Sma*1–*Sal*1 fragment from an M13mp18 clone containing the consensus ftz-binding sites. The UAS_G DNA between the *Sma*1 and *Xho*1 sites was deleted in construction of pDF6. DNA for these reporter constructs and the indicated GAL4 derivatives was used to transform the yeast strain YM709 (*Δgal80 Δgal4 ade2-101 lys2-801 his3-200 met trp tyr can1*) and β-galactosidase assays of yeast cell extracts were performed after growth on minimal medium (0.67% yeast nitrogen base without amino acids, 2% glucose) supplemented with the appropriate amino acids. The *G/ftz*$^{3-413}$ construct which expresses a chimaeric GAL4/ftz polypeptide containing amino acids 1–10 of GAL4 and amino acids 3–413 of ftz was made by introducing a 10-base pair *Eco*R1 linker at the blunted *Sph*1 site in *GAL4* DNA in the plasmid pMA235 (ref. 14) and then cloning *ftz* cDNA with *Eco*R1 linkers between the two *Eco*R1 sites of this pMA235 derivative. The non-ftz amino acids encoded at the GAL4/ftz junction of this construct are: MKLLSSIEQAEFGDP-T(3)-ftz.

To assess the transcriptional activity of ftz in yeast cells, we tested whether there were any domains within the ftz polypeptide that could functionally replace the acidic transcriptional activation domains[14] of GAL4. To do this, we fused the coding sequences of the DNA-binding domain of GAL4 (amino acids 1–147) to cDNA sequences encoding all but the N-terminal methionine and alanine residues of the ftz polypeptide. The resulting GAL4/ftz$^{3-413}$ chimaera, like similar fos and myc chimaeras[15], was almost as effective as GAL4 itself in activating transcription in yeast cells of a reporter construct containing GAL4-dependent upstream activating sequence (UAS_G) fused to β-galactosidase coding sequences (Fig. 1*a*). To map independent DNA-binding and transcriptional activation domains in the ftz polypeptide, we assessed the ability of GAL4/ftz constructs containing deletions in the ftz coding sequence to activate transcription of the same reporter gene (Fig. 1*a*). The transcriptional activation function was reduced in cells expressing deletion clones lacking the N-terminal 222 amino acids (GAL4/ftz$^{223-413}$) or C-terminal 141 amino acids (GAL4/ftz$^{3-272}$) of the ftz polypeptide and was eliminated by more extensive deletions removing the N-terminal 272 amino acids (GAL4/ftz$^{273-413}$) or the C-terminal 192 amino acids (GAL4/ftz$^{3-221}$). The inactive derivatives were not unstable poly-

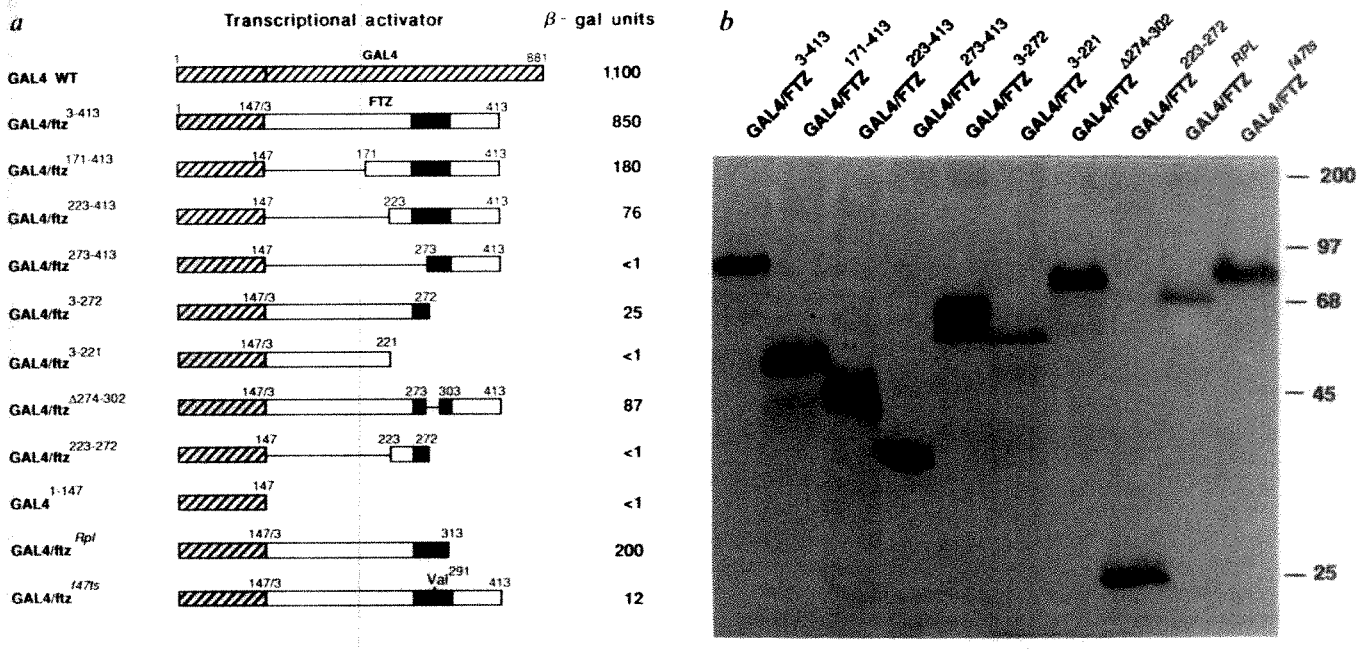

Fig. 1 *a*, UAS_G-dependent transcriptional activation by GAL4/ftz chimaeras. The ability of various GAL4/ftz chimaeric polypeptides expressed in yeast cells to activate transcription was assessed by quantitating β-galactosidase activity present in extracts of yeast cells containing a GAL4-dependent (UAS_G) β-galactosidase reporter gene. The activation of transcription by wild-type GAL4 (GAL4 WT) has been compared with that by GAL4/ftz chimaeras containing amino acids 1–147 of GAL4 and the indicated amino acids of the ftz polypeptide. The filled box denotes the homoeodomain, the hatched boxes are GAL4 sequences. *b*, Immunodetection of GAL4/ftz polypeptides present in yeast cell extracts. Relative molecular masses are shown on the right, in thousands.

Methods. Wild-type *GAL4* DNA was introduced into yeast cells on the yeast plasmid pMA210 (ref. 14). The GAL4/ftz chimaeras were constructed by cloning *ftz* cDNA fragments originating from the plasmid pGEMf1 (ref. 11) into the unique *Eco*R1 site encoding amino acid 148 of GAL4 in the pMA210 derivative pMA235 (ref. 14). GAL4 and the GAL4/ftz chimaeras were therefore expressed from the *ADH1* promoter on a *HIS3* 2μ yeast vector as described[14]. The correct reading-frame fusions were achieved using an appropriately sized *Eco*R1 linker and/or by first cloning the *ftz* DNA fragments into the polylinker of pEMBL or Bluescript vectors. The amino acids (one-letter code) at the GAL4/ftz junctions were: for GAL4/ftz^{3-413}, GAL4/ftz^{3-272}, and GAL4/ftz^{3-221}, GAL4-S(147)-PEFIKEEKLTMRDP-T(3)-ftz; for GAL4/ $ftz^{171-413}$, GAL4-S(147)-PEFELGTRGSSR-V(171)-ftz; for GAL4/$ftz^{223-413}$ and GAL4/$ftz^{223-272}$, GAL4-S(147)-PEFELGTP-V(223)-ftz; for GAL4/$ftz^{273-413}$, GAL4-S(147)-PEFELGTRGSSRV-E(273)-ftz; for GAL4/ftz^{Rpl} and GAL4/ftz^{f47ts} GAL4-S(147)-PEFGDP-T(3)-ftz. Amino acids in the C-terminal extensions before the first in-frame stop codon were: for GAL4/ftz^{3-272}, L(272)-DREGVPLQ; GAL4/ftz^{3-221}, S(221)-GL; and for $GAL4^{1-147}$, S(147)-PEF. The GAL4/$ftz^{\Delta 274-302}$ construct was made by deletion of *ftz* cDNA between its *Xho*1 and *Bgl*II sites. DNA of the GAL4 and GAL4/ftz constructs was used to transform the yeast strain YM709::RY171 (*Δgal80 Δgal4 ade2-101 lys2-801 his3-200 met trp tyr can1*) which contains a single copy of the GAL1/lacZ reporter RY171 (ref. 26) integrated at the *URA3* locus. The ability of the chimaeric constructs to stimulate expression of the reporter gene was quantitated by assessing β-galactosidase activity in the yeast cell extracts[27] after growth at 30 °C in minimal medium (0.67% yeast nitrogen base without amino acids, 2% raffinose) supplemented with the appropriate amino acids. The GAL4/ftz^{f47ts} strain was grown at 19 °C. For immunodetection of GAL4/ftz polypeptides, protein extracts were prepared as described[28] from 5 ml yeast cells grown to mid log-phase. Equivalent aliquots of each protein preparation were fractionated on an 11% polyacrylamide-SDS gel, and electrophoretically transferred on to nitrocellulose. The GAL4/ftz polypeptides were detected with a polyclonal anti-ftz antibody[11] and an alkaline phosphatase-coupled second antibody preparation (Bio-rad).

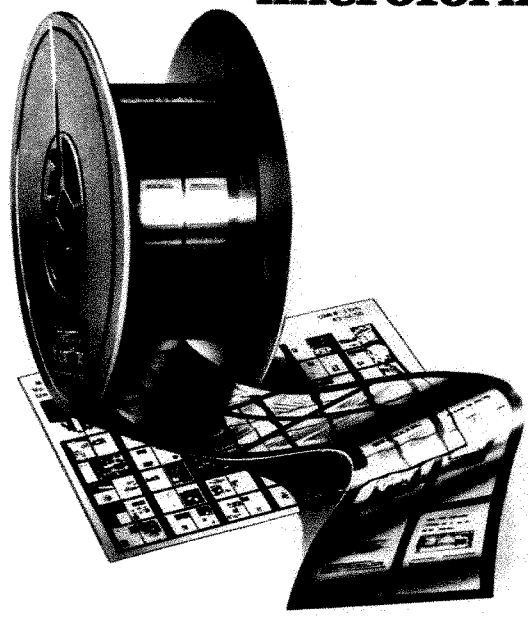
peptides in yeast; each of these different GAL4/ftz chimaeric polypeptides could be detected in extracts of yeast cells with a polyclonal anti-ftz antibody[11] (Fig. 1*b*). The transcriptional activity seen with the GAL4/ftz chimaeras with either N- or C-terminal deletions of ftz coding sequences indicated that an activation domain of the ftz polypeptide might reside between amino acids 223 and 272. A GAL4/ftz fusion containing only this small domain (GAL4/$ftz^{223-272}$) did not activate transcription however. Perhaps the transcriptional activation domain of ftz is not just a short array of contiguous amino acids as it is in GAL4 (ref. 14) and GCN4 (ref. 16).

If the ftz polypeptide is a transcriptional activator in *Drosophila*, then mutations that affect ftz function in *Drosophila* might be expected to alter the transcriptional activity of ftz in yeast. The dominant allele *Rpl* in *Drosophila* encodes a ftz polypeptide truncated at its C-terminus[4]. *Rpl* causes patchy transformations of the posterior third thoracic segment into the posterior second thoracic segment[17]. In yeast cells the GAL4/ftz^{Rpl} chimaeric polypeptide had about 25% of the transcription-activating potential of the wild-type GAL4/ftz chimaera (Fig. 1*a*). This observation is consistent with the suggestion[17] that a weakened ftz^{Rpl} polypeptide may be sufficient to define parasegmental boundaries but not sufficient to activate genes of the bithorax complex properly. We also assessed the effects in yeast of a second ftz mutation. The temperature-sensitive ftz^{f47ts} allele encodes a single alanine to valine change within the homoeodomain of the ftz polypeptide[4]. In yeast cells the chimaeric GAL4/ftz^{f47ts} polypeptide was a weak activator of transcription at high temperatures (30 °C or 37 °C; data not shown) and, somewhat unexpectedly, also at low temperatures (19 °C; Fig. 1*a*). As the ftz^{f47ts} polypeptide does function at permissive temperatures in *Drosophila* embryos, it may be stabilized by interaction with other *Drosophila* transcription factors that are not present in yeast cells.

To determine whether the ftz polypeptide could also provide sequence-specific DNA-binding activity in yeast cells, we introduced into yeast cells a β-galactosidase reporter construct that contained six tandem repeats of a *Drosophila* ftz-binding chromosomal sequence[8] as a transcriptional element (Fig. 2*a*). The results of β-galactosidase assays using this reporter con-

struct in yeast cells expressing GAL4/ftz$^{3-413}$, or a second GAL4ftz chimaera (G/ftz$^{3-413}$) containing only the N-terminal 10 amino acids of GAL4, or GAL4 are shown in Fig. 2*b*. This oligomer of consensus ftz-binding sites functioned as a ftz-dependent UAS, with GAL4/ftz$^{3-413}$ and with the G/ftz$^{3-413}$ construct. Furthermore, the integrity of the homoeobox was necessary for this transcriptional activity. The deletion construct GAL4/ftz$^{\Delta 274-302}$ which lacks 29 amino acids in the homoeobox, including its putative helix–turn–helix motif, did not activate transcription of this reporter gene. Nevertheless, this construct did provide some transcriptional activation function when UAS_G-dependent activity was monitored (Fig. 1*a*).

We have exploited the species interchangeablity of transcription factors[18–22] to establish that a *Drosophila* homoeodomain-containing regulator of embryonic development can act as a positive activator of transcription. That the transcriptional activation domains of GAL4 can be replaced by *ftz* sequences implies that GAL4 and ftz may stimulate transcription by a similar mechanism, perhaps by contacting RNA polymerase II (ref. 23) or the TATA-box factor[24] directly. Our deletion analyses (Fig. 1*a*) however, did not define any short acidic activation regions in the ftz polypeptide such as those in GAL4[14]. Transcriptional activation by the ftz polypeptide may therefore depend more on the overall secondary and tertiary structure of ftz, or on its post-translational phosphorylation[11]. In preliminary experiments (V.D.F., H. M. Krause and C.J.I., unpublished observations) we have shown that the ftz polypeptide is also highly phosphorylated when it is expressed in yeast cells. These observations raise the possibility[25] that phosphorylation of serine and threonine residues may create acidic transcriptional activation domains in transcription factors such as ftz. The differential phosphorylation of ftz during *Drosophila* embryogenesis could be a fine-tuning mechanism for its potential as a transcriptional activator.



We thank Henry Krause and Jacqueline Segall for helpful suggestions, Henry Krause and Walter Gehring, Jun Ma and Mark Ptashne, Alan Laughon and Robert West for DNA, and Claude Desplans for the consensus ftz-binding element. This work was supported by grants from the MRC of Canada, the National Cancer Institute of Canada, and a grant from the NIH to the BIONET Resource. V.D.F. holds an MRC of Canada Studentship.

Note added in proof: two recent reports have demonstrated transcriptional activation by *Drosophila* homoeobox proteins[30,31].

Computer-analysed 2-D electrophoresis

I.R. Krauss, P.J. Collins and S.H. Blose

service is now available for analysing 2-dimensional gels and comparing them to existing databases, roadening the number of laboratories which can study protein expression using the technique.

wo-dimensional gel electrophoresis is a owerful biochemical resolving technique at allows life science researchers to vestigate changes in cellular protein pression quantitatively. Using the propriate protein identification procdures and experimental designs, the chnique can be exploited to capture formation on changes in genetic expreson which can be compiled into databases protein information. Powerful patternatching and data analysis software has en developed to harness and manipute the large quantity of data contained in dimensional gels, and new experimental proaches are being discovered to make e technique easier to perform.

Proteins identified by their abundance id positional coordinates serve as landarks for the computer analysis of dimensional gels. Valuable biological formation can be gleaned by exposing lls to a set of specific experimental contions and examining their biochemical sponse, provided the multitude of cellur reactions stimulated by the conditions n be deciphered. Protein databases mpiling the global changes in cellular stems brought about during development, and by exposure to drugs, growth ctors, and stress, can shed light on speci cellular biochemical mechanisms. The nstruction of such databases is becomg widespread by laboratories with scients trained to carry out 2-dimensional gel ectrophoresis, but for many labs the chnology remains inaccessible.

athways to access

t Protein Databases, Inc. we have set up tabases of protein information obtained quantitatively scanning 2-dimensional ls. The NIH 3T3 cell database contains named proteins separated using a 2-mensional gel system with an isoelectric int range of *p*I 3.5-10; our human serum otein database has 257 identified proins separated over the same range. The *cherichia coli* database contains 98 med proteins separated using an equilration gel type, and 54 identified proins separated on non-equilibrated gels.

We offer a range of levels of services for vestigators interested in protein expreson. At the most basic level, researchers ay submit biological samples to Protein atabases, Inc. for analysis, using off-the-elf sample preparation kits we have veloped for cultured cells, solubilized sue, and protein solutions.

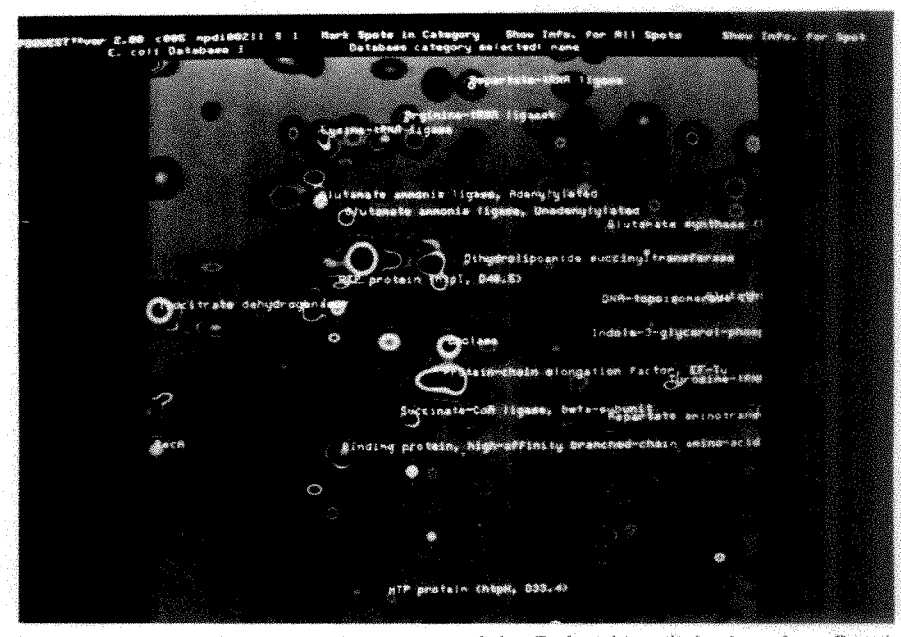

Fig. 1 Computer graphics screen showing part of the *Escherichia coli* database from Protein Databases, Inc., with several named proteins.

We perform high-resolution 2-dimensional electrophoresis, detect the proteins resolved in the gels using radioactive labels (^{3}H, ^{14}C, ^{32}P, ^{33}P, ^{35}S, or ^{125}I isotopes), silver staining, or Coomassie blue staining, and submit the gels to computer-assisted analysis by The Discovery Series™ of densitometry hardware and pattern-matching software. The software compares the experimental gels to the database for that organism and identifies co-migrating proteins with known proteins in the database.

The PDQUEST™ software in The Discovery Series™ sorts the data to locate proteins which have increased, decreased, appeared or disappeared as a result of experimental manipulation. For each sample submitted, researchers receive multiple exposed films of the gels; a 3 ft × 3 ft wall map of all protein spots matched during analysis; tables quantifying the amount of protein in each spot; histograms comparing the amount of protein in each gel; scatter plots correlating the level of protein expression between gels; and a map of the position, relative molecular masses and isoelectric points of the 300 most abundant proteins.

Post-analysis services are available for sorting the data to answer specific questions, or researchers may request copies of the spreadsheet data on disks formatted for use with either Macintosh or MS-DOS-based computers and perform their own analyses. We also offer pre-packaged services for performing phosphorylation studies, determination of partial amino acid composition, and *t* test and Mann-Whitney statistical analyses.

Researchers who perform 2-dimensional gel electrophoresis in their own laboratories can access our established databases by purchasing a sub-licence for the PDQUEST™ software and the pertinent protein database. Known proteins can be identified by comparing the 2-dimensional gels scanned and analysed with The Discovery Series™ system to proteins contained in the database. The PDQUEST™ software is available for MicroVAX, Sun and Masscomp computer systems running the UNIX operating system.

Researchers may also construct their own databases of protein information by purchasing The Discovery Series™ of hardware and software. After performing 2-dimensional electrophoresis and subjecting their gels to computer-assisted analysis, users can identify proteins of interest through a variety of biochemical means[1-3]. The most common tools used today include blotting followed by various forms of specific identification, blotting followed by direct microsequencing of proteins from 2- dimensional gels[4], 2-dimensional electrophoresis followed by deter-

mination of phospho- and glycoproteins and sub-cellular fractionation followed by 2-dimensional electrophoresis.

Protein Databases, Inc. also offers services for assisting researchers to purify and identify proteins of interest using preparative gels and blotting techniques that can provide purified protein in amounts sufficient for antibody identification or amino acid sequencing. The proteins are blotted onto either nitrocellulose or Millipore's Immobilon membranes. Blots to be used for direct microsequencing are first evaluated before the sequencing blots are prepared, and we consult with researchers to determine the feasibility of obtaining enough protein to sequence.

Genomic activity

Cellular protein databases permit the monitoring of gene activity by detecting the expression and regulation of individual proteins, and can be used to analyse the equivalent of two million base pairs of actively coding DNA. The construction of a database of protein information produces an inventory of parts which can be used to understand how the proteins work and interact. Complementary technologies such as protein sequencing and synthesis, *in vitro* and *in vivo* genetics, and gene sequencing and synthesis may be used to extract additional information.

The collected information can then be organized into broad categories: physiologic information (regulatory behaviour and function), biochemical information (metabolic and structural data), genetic information (gene mapping and the assignment of structural genes to the 2-dimensional gel map), and architectural information (location of the protein in the cell). A database with this information permits the location of genes coding for proteins of interest, and can aid in gene cloning, and the analysis of gene networks.

As science proceeds with the sequencing of various genomes — including the human genome — the elucidation of the structure and function of proteins expressed by specific genes will allow the scientific community to understand the subtle interplay of cellular systems which lead to the regulation of organisms as a whole. The major benefit of this will be to allow the modelling of the biochemical behaviour of the cell, which should permit predictions of system behaviour and new insights into various genomes. □

Marc R. Krauss, Paul J. Collins and Stephen H. Blose are at Protein Databases, Inc., 405 Oakwood Road, Huntington Station, New York 11746, USA. For more information, fill in reader service number 100.

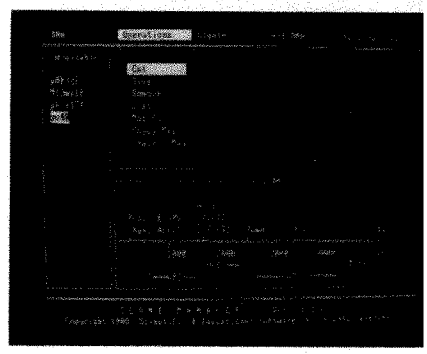
Software solutions

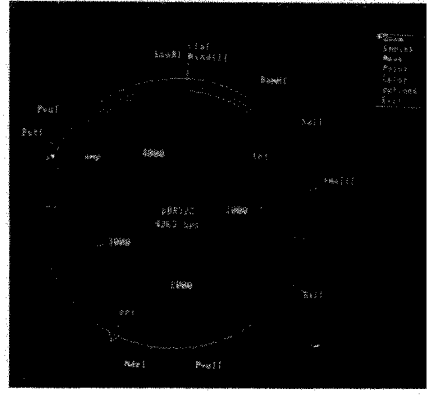
Programs for analysing chaos, keeping track of species density, wor processing mathematical expressions and teaching protein purificatic techniques are among this week's offerings.



Dynamical Systems, Inc. has a set of software packages for studying **nonlinear systems and chaos** as mathematical models or as trends in experimental data gathered in any of the physical or social sciences (*Reader Service No. 101*). Dynamical Software I — now in its fourth release version — allows users to solve differential equations using an Adams-type integrator, iterate discrete maps, create 2- and 3-dimensional colour-coded phase portraits, and compute next amplitude, 1-dimensional, time-one and circle maps. Special features include data smoothing and interpolation, random number generation, and time series embedding using the Takens method. Version two of the Dynamical Software II package performs more sophisticated analyses: the integration of delay differential equations, the generation of power spectra for Rössler Attractors, and the computation of fractal dimensions, eigenvalues and eigenvectors, and Lyapunov exponents. DS I.4 costs $250 (US), and DS II.2 costs $350 (US); both can be purchased together for $550 (US). The software runs on an IBM PC/AT/XT with a 1.2 Mbyte drive and a graphics card.

Wolfram Research is now distributing a **free program** for reading "Notebooks" generated using Stephen Wolfram's widely heralded *Mathematica* software, which contains a core of mathematical knowlege that can be used as an interactive calculational tool and as a programming language (*Reader Service No. 102*). The MathReader program is used for viewing interactive "Notebook" documents, which contain text, graphics and executable *Mathematica* commands. The "Notebooks" can serve as a medium for the exchange of technical documents or scientific results, and can be animated to form "movies" for tutorial purposes. MathReader allows users to view "Notebooks", to outline text and animate graphics, but not to edit or print documents. *Mathematica* also is now available for all 386-based MS-DOS computers, making it usable on virtually every computer system. (For a user review of *Mathematica*, see *Nature* **336**, 319-20; 1988.)

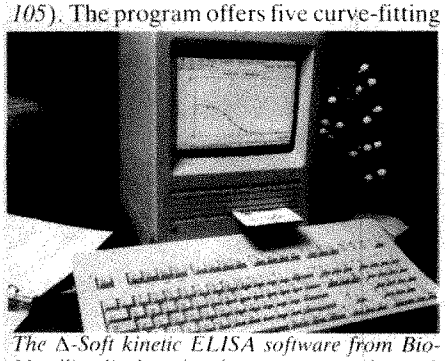
Analytical applications



Tetrad, from Oxford Mobius, stores, processes, analyses and maps **species distribution** data for naturalist studies, using a 2 × 2 km square, or tetrad, as its unit of area (*Reader Service No. 103*). The program accepts up to 200 individual or speci names for each database. Species inforr ation is stored on up to four levels in ea tetrad, which can be analysed in a combination. Distribution maps can produced directly from data files using dot-matrix printer, eliminating the ne for manual drawing or typing of data. T £74.75 (UK) Tetrad program runs IBM PCs equipped with a hard disk wi at least 1 Mbyte memory capacity.

The Clone Manager program fro Scientific & Educational Software can

The windows can be used to view linear rep sentations of the map.



used to construct circular and linear **res riction maps** of recombinant DNA mole ules (*Reader Service No. 104*). Fra ments may be cut from any molecule a combined: the program automatical recalculates the base positions of restri tion sites, genes and markers, and dra the new map. A special "PopUp" con mand opens a window on the screen show the linear map of the DNA molecu being displayed. Cut DNA fragments a spliced together using the "Ligate" fun tion: Clone Manager automatically cognizes blunt end ligations, and w relabel a fused *Bam*HI and a *Bgl*II fra

Circular plasmid map generated using Clo Manager.

ment to acknowledge the creation of a new *Sau*3A site. The program is IBM-compatible and costs $100 (US) for individual users.

BioMetallics sells its Δ-Soft software for the collection, analysis, storage, and reporting of data from endpoint and kinetic **microtitre assays** (*Reader Service No. 105*). The program offers five curve-fitting

The Δ-Soft kinetic ELISA software from BioMetallics displays the plate pattern together with the data.

options and a complete set of statistical operations. Δ-Soft can display the plate pattern simultaneously with the corresponding data, and it has a zoom function to allow users to inspect the kinetic data on individual wells more closely. The software will perform threshold screening and masking of specific wells, and will remove outliers automatically. The Macintosh-compatible program was designed for use with Molecular Devices microtitre plate readers, but can also be used with those from several other manufacturers.

The ChemResearch software from Isco, Inc. combines **HPLC gradient programming** and system control with dual-

The Isco ChemResearch software for data management and control, along with Isco HPLC hardware.

channel data acquisition and integration (*Reader Service No. 106*). The program runs on IBM PS/2 and PC-compatible computers, and the current version supports high-resolution colour graphics and the transfer of files to other applications. Data functions include real-time display and printout, integration reports and standards comparisons. ChemResearch was written for use with Isco HPLC solvent delivery systems, but it can also be adapted for use with binary gradients and with nearly any HPLC pump which has voltage or frequency inputs.

Hitachi's Spectra Calc software interfaces Hitachi scanning UV/visible, near-infrared and fluorescence spectrophotometers with IBM PCs and compatibles (*Reader Service No. 107*). The software provides an array of commands for **spectral data processing**, including a "Draw" function which allows the use of lines, arrows, boxes, icons, and different fonts and colours for the presentation of data. Hitachi says Spectra Calc's Array Basic programming language runs at speeds associated with mini-computers, and allows users to write customized software. Files created with Spectra Calc can be converted to a variety of formats, including ASCII, Lotus, DIF and J-Camp.

Axxiom Chromatography is offering a free IBM-compatible demonstration disk for its range of PC-based **chromatography data systems** to give researchers interested in the software a chance to test it out in their own laboratory (*Reader Service No. 108*). The company offers systems which can be configured for the integration of HPLC, GC, supercritical fluid chromatography, isocratic chromatography and capillary zone electrophoresis.

Scientific publishing

Vuman Computer Systems's VuWriter **word-processing software** provides full Greek, scientific and teletex character sets, and allows the construction of brackets and integral signs of any specified height (*Reader Service No. 109*). The £95 (UK) program has an on-screen overstrike facility through which complex characters can be built, and the Greek character set has diacritics for printing Western European language characters. VuWriter can now be linked to the Aldus PageMaker and the Xerox Ventura desktop publishing systems.

EndNote, released by Niles & Associates last year, automates **bibliography building** and the formatting of in-text citations (*Reader Service No. 110*). The software is a combination of a desk accessory and an applications program, and is designed to work with Microsoft Word, MacWrite and WriteNow word-processing software. EndNote can maintain searchable databases of up to 32,000 references, and users can paste citations into text as they write, without leaving the computer to search through journals. EndNote scans the finished paper and creates a bibliography of cited works at the end of the paper, in the correct styles for *Nature*, *Science* or several other leading journals. The non-copy-protected software sells for $129 (US).

Two new updates are available for the Reference Manager **bibliography management software** from Research Information Systems (*Reader Service No. 111*). Reference Manager now has a Splicer module that can splice citations located using the software directly into word processing text, through a series of cut-and-paste operations. The Splicer module requires Reference Manager 4.0 or higher, and 210 Kbytes of available RAM after loading the word-processing program. Through the Reference Update service offered by the company, users receive a weekly diskette containing current information from over 400 of the leading biological and medical journals. The updates can be searched for combinations of authors, journal names and phrases, and identified references can be printed out as lists or reprint request cards, or can be exported to Reference Manager. Reference Manager is available for IBM-compatible and Macintosh PCs.

ADVERTISEMENTS

ACTIVITY MONITOR

Automatic measurement of animal movement from the video (TV) image. For water maze (pool), open field, radial maze etc. IBM-PC compatible. Software for latency, path length, percent time moving, position preference etc. Options for rearing and social interaction.

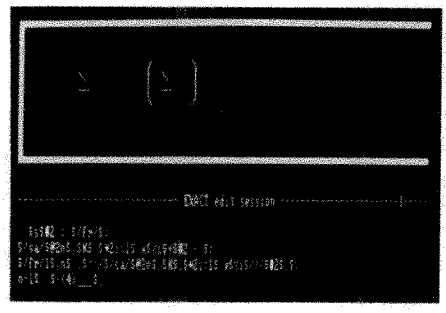
Economical Modular Tissue Culture Incubator



• **Safe** for AIDS research • **Reliable**, for In-Vitro fertilization
• **Versatile** enough for thousands of lab uses

Easy to use – Just flush with gas mixture, seal and place at approp. temp. Perform multiple experiments simultaneously w/out cross contamination. Thousands in use worldwide.

For information contact **Flow Laboratories, Ltd** or **Billups-Rothenberg, Inc.** • P.O. Box 977 Del Mar, CA 92014-0977 USA • (619) 755-3309

Reader Service No. 25

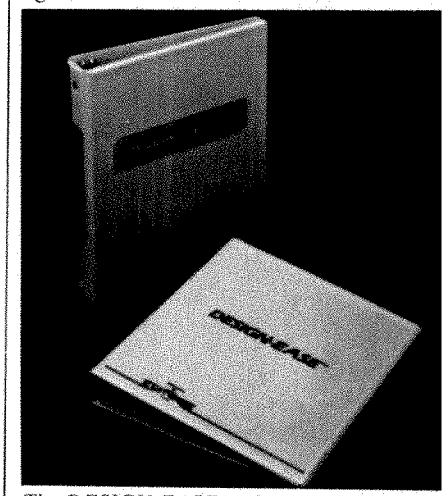
The EXACT software from Technical Support Software, Inc. is for **mathematical typesetting** using Microsoft Word, WordStar, Multimate, Displaywrite, Samna, WordPerfect versions up to 5.0, and most other PC-based word-processors (*Reader Service No. 112*). EXACT is a RAM-resident program which cooperates with the user's word-processor to create complex mathematical expressions which can be displayed on the screen as they will appear in print. Through a split-screen function, EXACT can be used to edit mathematical expressions during the drafting of documents. Radicals, fractions, brackets and tables automatically rescale when they are changed: once the equation

With the EXACT mathematical software the command string and the equation can be viewed at once.

looks correct, the user can return to the text and insert the command string for printing the equation. The $495 (US) basic IBM-compatible software ($385 (US) for academics) includes 20 fonts with over 1,000 symbols and characters, plus a font editor for creating custom symbols.

Graphing and modelling

The French company Biostructure recently launched a computer-aided engineering package for evaluating the tridimensional structure of new molecules, and visualizing and manipulating them on a high-resolution graphics screen (*Reader Service No. 113*). Biostructure's BIO-EXPLORE software combines **molecular structure prediction tools** with interactive capabilities for searching the major international protein data banks to offer insights into new drug design. Protein engineers, immunologists and molecular biologists can use BIO-EXPLORE to identify homologies in known molecules and determine active sites of new molecules without performing experiments. BIO-EXPLORE is available as a turnkey system based on a Silicon Graphics workstation, starting at $81,000 (US). The software is also available as an option on Silicon Graphics and DEC workstations.



Chemical Design offers an automated procedure for the construction of **3-dimensional models of proteins**, based on software techniques developed at Birkbeck College in London (*Reader Service No. 114*). The package predicts the 3-dimensional structure of a protein by detecting homologies in its amino acid sequence with those corresponding to known protein folding patterns. Chemical Design says the approach has been used to generate useful models of proteins which shared only 20 per cent sequence homology with the protein that suggested its structure. The software matches the protein sequences and generates a number of 3-dimensional models automatically; the predicted structures can subsequently be manipulated and evaluated using molecular mechanics and dynamics programs. According to the company, the process of alignment and initial model building typically takes less than 10 minutes on a VAX 8600 computer.

New England Software has published an **X-Y graphing utility** for technical and scientific applications which it says has the same user-friendly qualities as its award-winning Graph-in-the-Box software for making business graphs (*Reader Service No. 115*). The new ANALYTIC RAM-resident software makes 16 types of graphs based on X-Y and double-Y plotting, with a choice of linear or logarithmic scaling for up to three axes. Like its Graph-in-the-Box precursor, ANALYTIC captures data directly from the screen of any application program and instantly displays the data as a graph. The program offers high-low-close graphs, error bars, curve fitting and trend analysis; the graphs can be read against both a left and right Y-axis. The $199.95 (US) IBM-compatible ANALYTIC can be used with most desktop publishing programs, and over 200 printers and plotters.

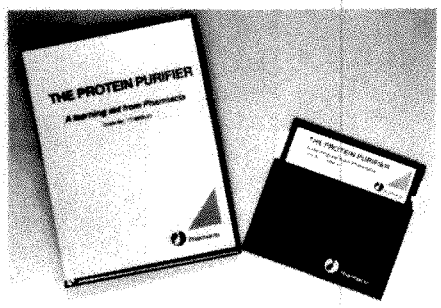
MicroMath's MINSQ package for **non-linear curve fitting and model development** can be used without data for plotting model equations, which can be optimized later to best fit data using least squares analysis (*Reader Service No. 116*). The models can be simple equations or multi-line routines that can include parametric, integral or implicit functions. Model equations can be read from a file or entered from the keyboard, then modified interactively with the built-in editor. Up to 10 data sets may be present in memory simultaneously; previous models may be recalled for further analysis or plotting. Linear parameters are identified algebraically and solved for explicitly during the model fitting process, so that by default only nonlinear parameters are defined iteratively. Subsets of data or parameters may be fitted separately before fitting the whole model, and a "fine-tuning" option allows the adjustment of step sizes and convergence criteria for difficult problems. The interactive graphics section provides facilities for zooming in on smaller regions and for annotating plots with text, lines or arrows. The non-copy-protected MINSQ requires MS-DOS 2. or greater, 512 Kbytes of compute memory and a graphics adaptor card, an costs $179 (US).

Statistics packages

Stat-Ease, Inc. is now offering site licence for its **experimental design software** pack ages, DESIGN-EASE and DESIGN

The DESIGN-EASE and DESIGN-EXPERT software packages from Stat-Ease offer statistical analysis capabilities for basic to specialized applications.

EXPERT, so that organizations can mak copies of the programs for each indivic ual's computer (*Reader Service No 117*). DESIGN-EASE uses visual graph ical techniques, and allows researchers t choose, conduct and analyse two-leve experimental designs, including fractiona factorial and Plackett-Burman designs For the advanced experimenter DESIGN-EXPERT offers response sur face and mixture design capabilities. Stat Ease says the program handles up to fiv responses simultaneously in its optimiza tion routines, and Box-Behnken an central composite designs can be con structed and analysed. Both programs ru on IBM computers and compatibles.



The SPSS Inc. **statistical data analysi** and presentation software is now availabl for the VAXstation 3100 and VAXstatio 3520/3540 computers (*Reader Service No 118*). SPSS-X offers a set of advanced stat istical procedures which are used in busi ness, government, and academic an scientific research. SPSS-Tables display presentation-quality results of analyses o summarized data in several tabular forms SPSS-Trends is a forecasting and time serie analysis option including Box-Jenkins an spectral analysis modeling techniques SPSS intends to develop SPSS-X softwar to support the DECstation 3100 this year The company has also signed an agree ment with Management Computer Inter national AB of Stockholm, Sweden t jointly develop a statistical data analysis package for the Apple Macintosh II and SE computers by mid-1989.

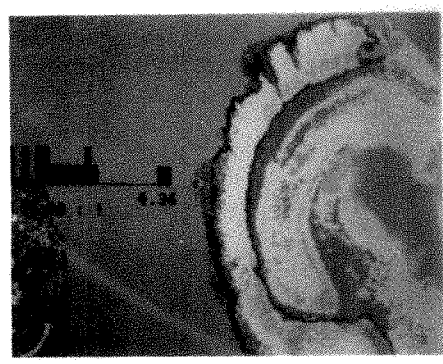
SYSTAT has just released its FASTAT **statistics and graphics package**, for the Macintosh computer (*Reader Service No. 119*). FASTAT's list of statistical feats includes one-way and multi-way tables, Chi-square, Pearson and Spearman correlations, regression, non-parametric tests, series transformation and smoothing, forecasting, principal components and common factor analysis, and travelling salesman problems. The $195 (US) software will create a sheaf of sophisticated graphs — many through only a click of the mouse — including stem-and-leaf diagrams, bubble plots, scatterplot matrices, factor-loading plots, and 2- and 3-dimensional scatterplots. MacDraw-like tools can be used to adapt and colour graphs, and scatterplot brushing tools are available for isolating and extracting cases, and "zooming in" on point clouds.

The PARVUS software package from Elsevier Scientific Software is a set of 50 programs for **multivariate statistical data analysis** (*Reader Service No. 120*). The IBM-compatible package is intended for general pattern recognition, and includes groups of programs for the explorative analysis and representation, classification and correlation of data. The programs can be divided into several functional groups: data import, data manipulation and preprocessing, methods classification, correlation analysis, target factor analysis, regression analysis, nonlinear mapping, graphical presentation, and utilities. The modular structure of PARVUS allows it to be used in a variety of ways, depending upon the application — from palaeontology to oenology. PARVUS costs $645, and comes on 15 diskettes supported by an extensive program manual.

Tutorials

The Protein Purifier from Pharmacia LKB is an IBM-based interactive program for teaching basic **protein purification techniques** (*Reader Service No. 121*). Students choose to purify one out of a starting

Pharmacia LKB's Protein Purifier tutorial program leads students through the purification process.



mixture of 20 proteins, using precipitation, gel filtration, hydrophobic interaction, chromatofocusing and other techniques. The software generates a chromatogram, showing the results of the separation, and efficiency tables to record how many man-hours per 100 units of international activity were required. Protein Purifier simulates activity tests to show active fractions, the pooling of tubes, and electrophoresis for determining the level or purity or certain physical characteristics.

Biosoft's Neurosim is a package of four programs which **simulate neural function** on an IBM PC (*Reader Service No. 122*). The user selects experimental and neurophysiological parameters, and the screen output resembles that of an oscilloscope during genuine experiments. Combinations of parameters can be saved as disk files, so instructors can set up experiments for subsequent demonstration. Any screen can be printed out on an Epson-compatible printer. Neurosim is comprised of four modules: Cable simulates passive conduction in the long length of an axon; HH simulates the Hodgkin-Huxley equations for the production of an action potential, and can be run clamped or unclamped; PSP shows the post-synaptic potentials developed by a neuron in response to various types of synaptic input; and Network simulates the rhythmic properties of a simple neural network of five neurons. The $199 (US) Neurosim package is for IBM PCs and true compatibles equipped with a graphics card.

TransTech has an educational/research package of software and plastic models for the investigation of **nuclear structure theory** using IBM-compatible computers (*Reader Service No. 123*). The software that comes with TransTech's face-centered cubic, or FCC, model package is designed to make quantitative comparisons among various nuclear structure models, and to elucidate the geometry of the solid-phase FCC model. The graphical displays emphasize the solid-phase FCC model and demonstrate how the liquid-drop, shell and cluster aspects of nuclei can simultaneously be found within the FCC model. TransTech says the package should also be useful for physicists involved in quark studies, because the FCC model is fundamentally a variant of the independent-particle model. TransTech sells the FCC package for $180 (US) or £90 (UK).

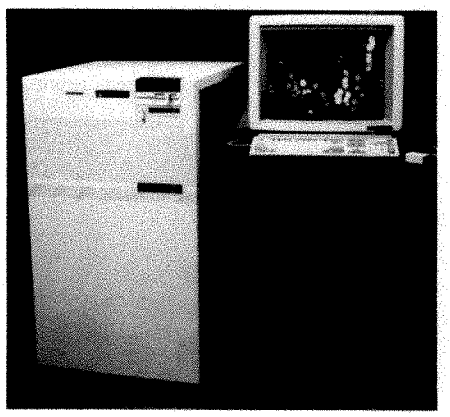
Image analysis

Sight Systems has developed a special software package for the automatic **analysis of autoradiographs** — the Image Manager (*Reader Service No. 124*). Image Manager offers an alternative to calibrating autoradiographs by comparing grey images with the reference exposures at the bottom of the film. With Image Manager, a video camera is used to capture an image of the autoradiograph, which is then digitized and stored on the system's 1,500-image capacity hard disk. When recalled

An autoradiograph of a rat brain processed using Image Manager, showing opiate receptors.

for analysis, the dosage levels of selected areas of the autoradiograph can be accurately determined. Greyscales reflected on the autoradiograph can be allocated pseudo colours on the screen for enhanced readability. Results can be graphed in several different formats, and can be transferred as ASCII files to other software packages for further analysis.

JAVA, from Jandel Scientific, is an IBM-compatible software package designed to **measure and analyse video images** from composite video sources, such as video cameras and VCRs, and pre-digitized formats, such as CAT, MRI and ultrasound (*Reader Service No. 125*). In addition to image processing, JAVA's capabilities include densitometry, morphometric analysis, automatic line and edge



The JAVA software from Jandel measures and analyses images from a variety of sources.

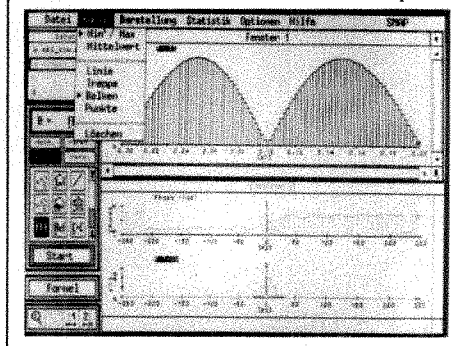
digitizing, and automatic object counting. Measurements are targeted to a 64,000-row by 16,000-column virtual worksheet which includes descriptive statistical functions and data transforms. JAVA now supports both the 640-pixel and 512-pixel versions of the Imaging Technology, Inc. PCVISION*plus* line of video digitizing boards, or frame grabbers. JAVA costs $995 (US).

The HIPS **general-use image processing package** from SharpImage Software runs under the UNIX operating system, and is compatible with VAX, MicroVAX, Sun, Apollo, Masscomp, NCR Tower, Iris and IBM AT computers (*Reader Service No. 126*). HIPS handles sequences of images in the same manner in which it processes single frames. Programs have been devel-

oped for simple image transformations, filtering, convolution, Fourier and other transform processing and edge detection. Users can also integrate their own custom routines. SharpImage says the $2,995 (US) HIPS can be adapted for use with most image display devices.

The supercomputer company Stellar has announced 30 new programs for its Stellar **graphics supercomputer**, including two new packages for image processing (*Reader Service No. 127*). Stellar says its supercomputer's dynamic 3-dimensional graphics capabilities and architecture provide powerful tools for real image processing in the fields of medical imaging, seismic modelling, remote sensing and scientific visualization. The new image processing programs are the IM Raster Toolkit from the University of Waterloo for the manipulation of raster images, and the Astronomical Image Processing System from the US National Radio Astronomy Observatory. Programs for MCAE, ECAD, computational chemistry, geophysical studies, animation and computational fluid dynamics are also available.

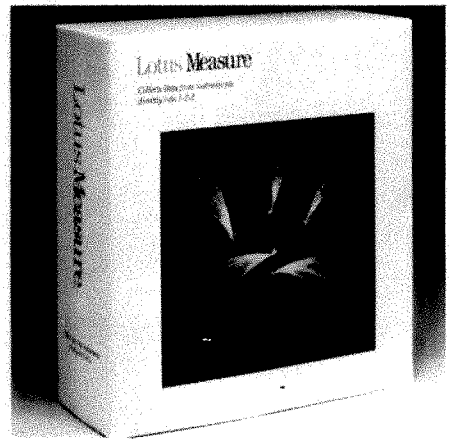
The Stellar Graphics Supercomputer has 30 new software packages.



Database data

ChromHELP, Inc. offers an **HPLC/TLC database** which allows busy chromatographers to find the latest and best separation methods without searching through piles of journals (*Reader Service No. 128*). The ChromHELP database contains over 3,000 references for the separation of over 7,000 compounds, compiled from journal articles published from 1987 to 1989. All entries include title, author, references and keywords, as well as the column size and packing, the mobile phase and flow rate, and important parameters pertaining to detection of the compound. The ChromHELP database is free to purchasers of ChromHELP, Inc. columns; others pay a nominal charge for searches and printouts.

CAIRS Information Management Systems now offers a facility for immediate updating on its CAIRS **text retrieval database** for micro-to mainframe computers (*Reader Service No.129*). Until this development, new information entered on CAIRS, or modifications of existing records, were held in a holdings file and merged with the main database at periodic intervals, usually the end of the day. With the new facility, specific text in an existing record can be changed without having to go through the update process, and exposing data which must never be changed to an update procedure.

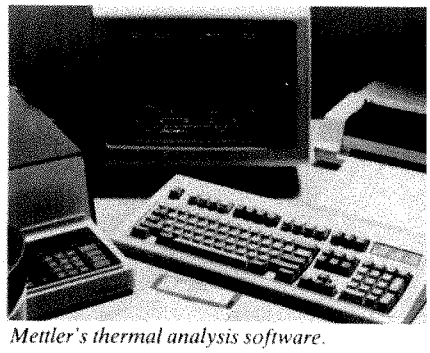


Data links

The Personal Computer Instruments-Signal Analysis Package, or PCI-SNAP, from Siemens is a **mathematical software package** for evaluating and analysing measured data from PC-based instruments (*Reader Service No. 130*). PCI-SNAP runs on any IBM-AT or XT-compatible PC with MS-DOS higher than version 2.1, and accepts data in ASCII files as well as other formats. The operation of PCI-SNAPS is graphics-oriented: the user can perform more than 100 functions and operations using the mouse, windowing, pull-down menus and graphic symbols. File management and the output of measured data is also controlled through these user interfaces.

The German version of Siemen's PCI-SNAP for the mathematical analysis of data.

The UK distributor of Lotus Measure, Industrial Data Processing Ltd, is now giving hands-on courses on how scientists and engineers can adapt the software using a PC for their own **data acquisition an analysis** applications (*Reader Service N 131*). Topics to be covered include inte facing with instruments, sensors, plug-i boards and A/D devices, real-time da analysis and display, fast Fourier tran forms, graphical presentations such trend and mimic displays, curve fitting an statistics, communicating data direct to spreadsheet, and preparation of technic data for publication. Lotus Measure co trols and monitors experiments and oth processes by sending commands to instr mentation and capturing data direct from sensors and instruments connecte through IEEE-48 bus and RS-232C seri interfaces.



Lotus Measure can be adapted for use with scientific and engineering applications.

Dedicated programs

The Gene-Master **DNA analysis prograr** for the Gene-Master DNA Workstatio from Bio-Rad prompts the user for a parameters and sequence files required i the analysis (*Reader Service No. 132*) Version 2.0 includes the Lipman-Pearso FASTN and FASTP functions for fa alignments and similarity searches DNA and protein databases. Bio-Ra says it also locates any word in GenBan or NBRF-PIR annotations in less than fiv seconds, double-checks entries for gel entered by sonic digitizer, and insert whole sequence files into another speci fied sequence to simulate genetic engin eering experiments. The program include the Staden Shotgun Handler, whic graphically displays sequence overlaps.

The TA72 GraphWare software fror Mettler supports the processing of **thermo analytical measured values and curve** determined by the Mettler TA3000 systen (*Reader Service No. 133*). The softwar allows several thermoanalytical curves t be compared and processed simultane ously. Other features include full or par tial integration over a definable range wit different baseline types, onset determina tion with tangents, and content analysi for crystallinity.

Mettler's thermal analysis software.

These notes are compiled by Carol Ezzell fro information provided by the manufacturers. T obtain further details, use the reader service car bound inside the journal. Prices quoted ar sometimes nominal, and apply only within th country indicated.

Virology

£18k inc **Greenford, Middlesex**

We are currently looking for an experienced Biochemist to join our expanding Virology Department, currently based at Greenford, but moving to our new research headquarters in Stevenage in a few years time.

You will lead a small group studying the mechanism of action of novel anti-herpes agents and developing novel anti-herpes targets.

You should have substantial experience in protein biochemistry (including a PhD or equivalent) and have specialised in enzyme kinetics, protein purification and related analytical methods.

In addition to an excellent salary and bonus scheme other benefits will include 25 days' holiday, subsidised sports, social and restaurant facilities as well as full assistance with relocation where appropriate.

Please send a c.v. or phone for an application form to Ted Smith, Senior Personnel Officer, Glaxo Group Research, Greenford Road, Greenford, Middlesex UB6 0HE. Telephone 01–422 3434, ext. 2934, quoting reference number G89035.

Glaxo Group Research

DIRECTOR
MOLECULAR GENETICS DIVISION

Children's Hospital National Medical Center of Washington, D.C. is seeking an individual to direct a newly created Molecular Genetics Division in the Department of Clinical Genetics. Candidates must have an M.D., Ph.D. or M.D./Ph.D. degrees and have previously demonstrated skill in the field of molecular genetics. The ability to supervise a rapidly growing research team and to conduct appropriate independent research is required.

Excellent salary and benefits package with tenured appointment at the Associate Professor or Professor level in the Department of Child Health and Development of George Washington University. Position available July 1, 1989. Send curriculum vitae and brief statement of research interests to:

Kenneth N. Rosenbaum, M.D.
Director, Clinical Genetics and Genetics Laboratory
CHILDREN'S HOSPITAL
NATIONAL MEDICAL CENTER
111 Michigan Ave., N.W.
Washington, DC 20010

Equal Opportunity Employer

(NW3325)A

DANA FARBER CANCER INSTITUTE
HARVARD MEDICAL SCHOOL
PROFESSOR OF PATHOLOGY

Dana Farber Cancer Institute (DFCI) and Harvard Medical School are seeking a Professor of Pathology with a primary research interest in the role of protein phosphorylation in the development of neoplasitc transformation. The candidate should be a distinguished investigator, and will become a member of the new Division of Cell and Molecular Biology at the DFCI. The successful candidate will be expected to carry out a strong basic science research program, and participate in the teaching of medical and graduate students in the fields of cell and molecular biology. Harvard University is committed to increasing representation of women and minority members among its faculty and particularly encourages applications from such candidates. Candidates should send a curriculum vitae, statement of research interests, and names of three references to **Karin E. Wetmore, Office for Faculty Affairs, Harvard Medical School, 25 Shattuck Street, A-302, Boston, MA 02115.**

Harvard Medical School and Dana Farber Cancer Institute are Affirmative Action/Equal Opportunity Employers.

(NW3316)A

Scientists

The research center of the largest pharmaceutical company in FRANCE is strengthening and diversifying its capabilities :

MEDICAL CHEMISTS

organic synthesis :
- heterocyclic
- lipid and peptide analogs

PHARMACOLOGISTS

- inflammation,
- pulmonary, diabetology,
- rheumatology,
- cardio-vascular diseases

You are scientists dedicated to the invention of new medicines with a post graduate degree and demonstrated achievement in applied research.

Some positions involve direction of a group while others offer professional development to young research scientists.

Our research center is located in the attractive western outskirts of Paris.

Adress inquiries, with a photograph to *PUBLIVAL/2019* 27, Route des Gardes - 92190 MEUDON (FRANCE) (W5873)A

BUTLER UNIVERSITY
DEAN OF THE HOLCOMB RESEARCH INSTITUTE

Butler University is seeking a Dean for The Holcomb Research Institute. The Dean will be a scholar committed to the basic aims and objectives of the Institute and to the further development and teaching programs of the University.

Holcomb Research Institute, a unit of Butler University, has an endowment of $19 million and projected revenues for 1988-1989 of $2.5 million from endowment, grants, and contracts. It is housed in a modern three-story building with 50,000 sq. ft. of research space. It is presently staffed by 41 individuals, including 10 doctoral-level investigators and 10 research assistants. The Institute is a multidisciplinary, environmental research center with programs in Water Science, Biotic Resources, and Environmental Economic and Policy Analysis.

Under the terms of the Institute's charter, the Dean will lead the Institute, whose "purpose, power and function is to engage in, promote, and finance fundamental scientific research in all fields, but especially [the environmental sciences]; to train students, undergraduate and graduate, in these fields; and to disseminate the knowledge derived from the research." The Dean will develop cooperative programs and joint appointments with appropriate University departments. He or she is expected to be a senior academic worthy of appointment to the tenured faculty of one of the University's senior colleges.

Butler is an independent, non-sectarian university with a total student population of 3,912 (full-time equivalent of 2,986), located on a 280-acre campus in a residential section of one of America's most lively and livable cities. Some 60% of the students are campus residents. Enrollment is growing, with applications for 1989-1990 showing a 30% increase over the previous year. The University's long-term plan calls for significant further expansion.

Nominations and applications for the position are presently being sought, with screening to begin April 1. Applicants should submit a letter indicating interest, curriculum vitae, and the names, addresses, and phone numbers of at least three references.

Butler is an affirmative action, equal opportunity employer. Please submit applications to:

Dean Robert A. Sandmann, Chair, HRI Search Committee, Butler University, 4600 Sunset Avenue, Indianapolis, Indiana 46208.

(NW3327)A

Professor of Biological Sciences

UEA NORWICH

(Molecular biology or microbiology)

Applications are invited for a professorial appointment in the area of molecular biology or microbiology in the School of Biological Sciences. The School is seeking to appoint a candidate with a proven research record who can lead a research sector and build on the range of expertise within it. The School has very close links with two affiliated Institutes — the John Innes Institute and the Institute of Food Research, Norwich; applicants who can further research interactions with them and can complement the expertise within them will be particularly welcomed.

The appointment is available from September 1989, and the salary will be by negotiation within the professorial salary range.

Applications (five copies), giving full particulars of age, qualifications and experience, together with the names and addresses of three persons to whom reference may be made, should be lodged with the **Registrar and Secretary, University of East Anglia, Norwich, NR4 7TJ, (tel. 0603 592208)** from whom further particulars may be obtained, not later than 17 March 1989.

The University is an equal opportunities employer. (8425)A

UNIVERSITY OF LEICESTER
DEPARTMENT OF PHARMACOLOGY AND THERAPEUTICS
Post-doctoral Research Assistant Pharmacologist/Biochemist

A post-doctoral position is available to study the interaction of endothelin and related peptides with neurone-like cells in culture at the biochemical level. This is an MRC position funded for three years on the Research Assistant 1A scale, available immediately.

The work will involve study of the binding of endothelin and related peptides, stimulation of release of neurotransmitter, and investigation of second messengers, regulation of intracellular Ca^{2+} etc. Experiments in the first instance will use cultured adrenal chromaffin cells.

Applications (with curriculum vitae and names and addresses of two referees) should be sent to: **Dr. M. R. Boarder, Department of Pharmacology and Therapeutics, University of Leicester, Medical Sciences Building, P.O. Box 138, University Road, Leicester, LE1 9HN, U.K. Telephone (0533) 522930.** (8417)A

MEDICAL RESEARCH COUNCIL
NATIONAL INSTITUTE FOR MEDICAL RESEARCH
LABORATORY OF PEPTIDE CHEMISTRY

A three year postdoctoral position is available immediately to work on the isolation, biosynthesis and cellular distribution of hormone processing enzymes. The position is suitable for organic chemists or biochemists; some experience in molecular biology and cell fractionation would be an advantage. Further information can be obtained from Dr D G Smyth (01-959-3666 ext 2171).

Salary will be in the range £12,520-£15,950 inclusive of London Allowance.

Applications including a curriculum vitae, and names of two professional referees, should be sent to **Mr C R Russell, Administrative Manager, NIMR, The Ridgeway, Mill Hill, London, NW7 1AA,** quoting job reference: 0238/PPC. Closing date for this post will be 10th March 1989.

An Equal Opportunities Employer.

MRC Medical Research Council

Post-Doctoral Research Virology and Cell Biology

The Wellcome Foundation is a recognised world leader in the discovery and development of new drugs for the treatment of AIDS. Opportunities now exist within the Department of Molecular Sciences for young post-doctoral scientists to join an expanding team engaged in research on AIDS and on AIDS related diseases.

Virologist

Molecular Biology of Retroviruses

£15,000-£20,000
Beckenham, Kent

- **The Wellcome Foundation Ltd.**
- **Major International Pharmaceutical Group**
- **Research Centre at Beckenham**
- **Annual Turnover > £1,250m**
- **An Equal Opportunity Employer**

The successful candidate will be involved in an ongoing programme to monitor the drug-sensitivity of virus isolates from patients receiving therapy for HIV infection. Attempts will also be made to generate drug-resistant variants of HIV in tissue culture and to characterise the genetic defects in those viruses. In addition the appointee will also become involved in work designed to identify suitable targets for chemotherapy and this will involve investigation of the basic replication processes of the virus.

He/she should be willing to work with HIV and already have some experience in virology/molecular biology, not necessarily with HIV itself. Knowledge of virus handling, DNA manipulation and DNA sequencing would be an advantage.

This will be a 3 year post-doctoral position. (Ref. 91/54A.)

Cell Biologist

Tissue/Organ Culture

To play a key role within a new multi-disciplinary programme of research aimed at developing better chemotherapeutic agents for the treatment of Pneumocystis carinii pneumonia, a major disease within the AIDS related Complex. This new appointee would be expected to initiate and conduct research on the development of better in vitro systems for the investigation of P.carinii. He/she would already possess some experience on the initiation of highly specialised cell, organ or parasite cultures and be interested in their application to the development of in vitro drug assays against the organism. (Ref. 91/54B.)

Willingness to collaborate effectively with an integrated team of biologists, biochemists and chemists is an essential requirement for both positions.

In addition to an attractive salary, we offer an extensive range of benefits including 5 weeks' holiday, profit share scheme, subsidised restaurant, first class sports and social facilities and pension and life assurance scheme.

Please write with full career details, quoting the appropriate reference number to: Miss S. J. McKinlay, The Wellcome Research Laboratories, Langley Court, Beckenham, Kent BR3 3BS.

Wellcome

(8451)A

University of Utrecht

The department of Geology of the Faculty of Geology and Geophysics invites applications for a position in mathematical Geology.

vac.nr. 145.109

universitair docent

(postdoctoral position in mathematical geology)

The position is a temporary one, for a maximum of four years starting as soon as possible. It will be part of the faculty's geology group, which has 18 tenured staff positions covering structural and applied geology, stratigraphy, sedimentology and paleontology.

Task: To support the development of teaching and research in the geological disciplines towards the use of quantitative methods, notably in data processing and geological modelling. Teaching is at the undergraduate and graduate level. Supervision involves mainly graduate students. A primary task is to extend data processing and geological modelling into the curriculum of geology students, and to encourage working relations in this field with the Faculties of Mathematics and Information Science. Research should be directed towards interdisciplinary projects of stratigraphers, sedimentologists, structural geologists and the geophysical groups of the Faculty, with particular emphasis on the storage and processing of large data-bases concerning the study of sedimentary basin evolution and paleoenvironments, the analyses of deformation patterns and the use of remote sensing.

Require ments:
- The candidate is expected to have a Ph.D.; and a research background in seismotectonics, with a thorough knowledge of modern seismological methods applied in studies of the earthquake source.
- Willingness to cooperate in joint research projects with members of the tectonophysics, seismology and geology (mainly structural geology/tectonics) groups.

Appoint ment: The successful applicant will appointed as "Universitair Docent" at a salary in the range Dfl. 3209,— to Dfl. 6980,— for a maximum period of four years.

Information: Dr. M.J.R. Wortel, tel.: 31-30-535074
(secr.: 31-30-535086)

Application: to be sent within 14 days of publication of this advertisement to the Personnel Manager of the Institute of Earth Sciences, P.O. Box 80.021, 3508 TA Utrecht, The Netherlands.

With equally qualified applicants preference will be given to a woman.

(W5881)A

UNIVERSITY OF LEICESTER
POSTDOCTORAL RESEARCH ASSOCIATE
DEPARTMENT OF GEOGRAPHY

Applications are invited from graduates who have completed or are due to complete a Ph.D. before 30 April 1989 for a 15-month post-doctoral associateship under EEC contract No. CI.109.UK(H) "Research and control of landslides and debris flows in the loess region of Gansu Province, China". Salary will be within the range £9,865 to £15,720 depending on age and experience.

Further particulars may be obtained from **Professor E. Derbyshire, Department of Geography, to whom applications (including a C.V. and names of two referees) should be sent to arrive no later than 24 February 1989.** (8418)A

MARIE CURIE CANCER RESEARCH
RESEARCH ASSISTANTS

1. Applications are invited for a position as Research Assistant in a laboratory devoted to understanding molecular mechanisms controlling eukaryotic transcription.

   Work in this laboratory has recently identified a yeast protein with a binding site identical to that of a mammalian transcription factor. By using a sequence-specific oligonucleotide column we have purified this yeast factor to near homogeneity. The successful candidate will be expected to continue this work with a view to obtaining sufficient quantities of the yeast protein for microsequencing and for the production of antibodies for use in cloning the gene for this factor. The project will involve a wide variety of modern molecular biology techniques including assays for DNA-protein interactions, protein purification, screening cDNA libraries and site directed mutagenesis of protein coding sequences. Experience of molecular biology would therefore be an advantage.

   Enquiries and C.V.s should be addressed to Dr. C. Goding, tel. 0883-722306.

2. A Research Assistant is required for cellular and molecular studies of the biology of pigment cells which will include malignant transformation, the regulation of melanogenesis and the interactions between keratinocytes and melanocytes. Current work involves studies of transcriptional regulation of pigment-associated proteins, melanocyte transformation by U.V. light and/or recombinant retroviruses. Candidates should possess a good degree in a biological science and must have hands-on experience in cell and/or molecular biology. Enquiries to Dr. G. Currie, tel. 0883-722306.

The posts are available for 3 years in the first instance and the salary, depending upon age and experience, will be on a scale ranging from £9,865 to £15,720.

The Marie Curie Research Institute is situated on the greensand ridge near Oxted in Surrey and enjoys views over three counties. On-site low cost cottage accommodation may be available.

Applications, including C.V. and the names of two referees, to **Dr. Goding or Dr. Currie at the Marie Curie Research Institute, The Chart, Oxted, Surrey RH8 0TL.** (8352)A

MEDICAL RESEARCH COUNCIL
NATIONAL INSTITUTE FOR MEDICAL RESEARCH
INFECTIONS AND IMMUNITY GROUP

Applications are invited for a three year postdoctoral position in the Division of Parasitology. The project is to characterize the genes for proteins of the malaria parasite involved in the invasion of mammalian red blood cells, using rodent model systems. This is an exciting opportunity to research the molecular basis of fundamental aspects of the parasite/host relationship in malaria, a major global disease.

Candidates should have preferably a background in biochemistry or molecular biology and some experience of molecular cloning techniques. Collaboration, both within the Infections and Immunity Group and with other workers at the Institute will be actively encouraged to promote the rapid application of advances in other areas to this project.

The salary will be in the range £12,720 to £16,150 per annum, including London Allowance.

Applications in the form of a full CV a list of publications and the names of two referees should be sent to **Mr C R Russell, Administrative Manager, NIMR, The Ridgeway, Mill Hill, London, NW7 1AA by 10 March 1989, quoting job reference: 0662/IPA.**

Informal enquiries to Dr K N Brown or Dr A A Holder (Tel: 01-959-3666) are welcome.

An Equal Opportunities Employer.

TOXINOLOGY GROUP

RESEARCH TECHNICIAN (BGM)

equired to join an expanding oup concerned with research ito a variety of bacterial protein oxins. Activities of the group in- ude research into the mode of oxin action, development of uman vaccines, development of nmunoassays, and genetic anipulation studies. The success- il candidate will be required to arn and use a wide variety of chniques concerned with the nalysis and purification of pro- ins and also methods associated ith monoclonal antibody produc- on and immunoassay develop- ent. You will be required to how drive and initiative and have 1st or 2nd class honours degree r equivalent in biochemistry or a elated subject. Experience in rotein purification techniques or nmunoassay methods would be n advantage although not essen- al.

The post will be funded initially or a period of three years. Salary ill be in the range £7,825-£10,496 under review) depending on xperience.

Application forms can be btained from the Personnel Offi- er, PHLS Centre for Applied Microbiology & Research, Porton Down, Salisbury, Wilts SP4 0JG. el: (0980) 610391 ext. 240, to hom completed forms should be eturned by 3rd March 1989 quot- ng Post No. 0551. (8401)A

Computing Specialist with Molecular Biology Experience

We have a vacancy for a Computing Specialist to lead the Molecular Biology Database Services Section (SEQNET).

SEQNET is a national computing facility for molecular biology recently established at Daresbury to provide interactive access to databases of protein and nucleic acid sequences for academic and industrial users.

The SEQNET service is based on a Micro VAX 3600 with network connection to JANET and PSS. The centre will hold the latest versions of nucleic acid databases, protein sequence databases and associated software packages. ISIS, a combined sequence and structure database, developed by the SERC's Protein Engineering Club is also available.

• The Job

The post-holder will be a member of the Scientific Database Group and will be responsible for the quality and reliability of the SEQNET service. He/she will participate in research programmes in the Laboratory and in collaboration with external researchers.

• Qualifications and Experience

Applicants should have a relevant degree or equivalent qualification. Candidates with a 1st or 2nd class honours degree should have 2 years post-graduate research and development experience. Candidates with other qualifications should have 5 years appropriate experience.

The successful applicant will ideally be a computing molecular biologist with a good understanding of relevant applications and techniques.

Further information on the technical aspects of this post may be obtained from Dr. H. J. Sherman (0925-603339).

• Pay

Appointments will be made at Higher Scientific Officer or Senior Scientific Officer grade depending on qualifications and experience. Salary is in the range £10,026 to £17,032 with further increments depending on performance.

The superannuation scheme is non-contributory. For an application form please quote Ref. DL70 and contact:

The Personnel Officer, Daresbury Laboratory,
WARRINGTON WA4 4AD.
Tel: (0925) 603467 (24 hour answering service).

CLOSING DATE: 3rd March, 1989.

Daresbury SCIENCE & ENGINEERING RESEARCH COUNCIL

THAMES POLYTECHNIC
SCHOOL OF BIOLOGICAL SCIENCES
& ENVIRONMENTAL HEALTH

RESEARCH TECHNICIAN/ RESEARCH ASSISTANT
MOLECULAR BIOLOGY

Applications are invited for the above post which is located in the laboratory of Dr. Ian Bruce.

The School is seeking to appoint a person to work on a molecular biology project funded by Hybaid Ltd. The work will involve Southern, Northern and Western hybridization using a variety of probes and running PFG's using a range of different DNA's. Some affinity chromatography may be involved.

Ideally, applicants should hold a biology or biochemistry degree or appropriate HND/C, and have some relevant experience in some or all of these techniques. However, training will be given if necessary. Further details can be obtained by telephoning Dr. Ian Bruce on 01-316 8215.

A competitive salary will be offered in accordance with qualifications and experience.

Application is by C.V., which should be sent to the **Staffing Officer, Thames Polytechnic, Wellington Street, London SE18 6PF** by 3rd March, 1989.

Thames Polytechnic — seeking to achieve equality of opportunity. (8421)A

Department of Meteorology — University of Reading

Post Doctoral Research Fellow
UNIVERSITIES' GLOBAL ATMOSPHERIC MODELLING PROJECT (UGAMP)

UGAMP is a multi-institute project funded by NERC. Its aim is to increase understanding of the troposphere, stratosphere and mesosphere using advanced numerical models incorporating dynamics, radiation and chemistry, exploiting CRAY supercomputer facilities. This work is fundamental to important issues such as the greenhouse effect and threats to the ozone layer. The Fellow will assist in the extension of existing tropospheric models to the mesopause, help analyse model integrations and incorporate new processes into the model. Applicants should ideally have a doctorate in meteorology, but those with experience of numerical modelling in related disciplines should also apply. The post is currently until 31 May 1990 with salary in range £9,865-£11,680 p.a.

Apply for Application Form and further particulars to **Personnel Officer, University of Reading, Whiteknights, P.O. Box 217, Reading RG6 2AH**, telephone (0734) 318754.

Closing date 10 March 1989. Please quote Ref. R8909. (8403)A

MEDICAL RESEARCH COUNCIL COLLABORATIVE CENTRE

A collaborative research programme has been initiated at the MRC Collaborative Centre, Mill Hill, for the development of transgenic technology for the production of human therapeutic proteins.

Research will be carried out on the regulation of transgenes in mice and larger animals and on the development and exploitation of embryonic stem cell lines. The following positions are available immediately and are tenable for 3 years:

GROUP LEADER TRANSGENICS/MOLECULAR BIOLOGY

A postdoctoral scientist responsible for the day to day management of the research programme. The successful applicant will have experience of recombinant DNA techniques and the expression and regulation of mammalian genes in transgenic animals.

Salary is within the range: £16,555-£20,760 inclusive of London Allowance. Ref: CC/HTP1.

RESEARCH SCIENTISTS

Scientist with experience at the postdoctoral level in either or both of the following fields:

a) recombinant DNA technology applied to the construction of heterologous genes in mammalian cells and/or transgenic mice.

b) mammalian embryology and/or reproductive physiology.

Salary is within the range: £12,520-£15,950 inclusive of London Allowance. Ref: CC/HTP2

RESEARCH ASSISTANTS

Research Officers and/or Technicians with experience in recombinant DNA technology, cell culture and/or reproductive physiology.

Salary is within the range: £8,172-£11,311 inclusive of London Weighting. Ref: CC/HTP3.

Successful candidates will be eligible to join the MRC pension scheme.

Applications with a full curriculum vitae and the names of two referees should be sent to **Mr N J Bowry, Personnel Officer, National Institute for Medical Research, Mill Hill, London, NW7 1AA** to arrive no later than 10th March 1989. Further information about the project is available from Dr Frank Grosveld on 01-959-3666. Please quote appropriate job reference.

DEPARTMENT OF BIOCHEMISTRY UNIVERSITY OF OXFORD

GLYCOBIOLOGY UNIT

POSTGRADUATE RESEARCH ASSISTANT 1B

BR/283

Applications are invited from suitably qualified graduates for the post of Research Assistant 1B to join an active group studying the structure and function of glycoproteins.

The successful candidate will be involved in the characterization of oligosaccharides from diverse sources and in associated support duties. Previous experience is not essential, but an understanding of various chromatographic, radiolabelling and computing techniques would be an advantage.

The appointment offers promising career opportunities in this exciting field, and is available for 3 years in the first instance.

Salary on the scale £8,675–£13,365 p.a.

Applications, including a curriculum vitae and the names and addresses of 2 referees, should be sent to: **The Administrator,**

An Equal Opportunity Employer. (8412)A

DEPT OF BIOCHEMISTRY, SOUTH PARKS ROAD,OXFORD,OX1 3QU.

THE INSTITUTE OF CANCER RESEARCH ELECTRON MICROSCOPY TECHNICIAN

The Institute of Cancer Research has a vacancy for a technician to work in its electron microscopy laboratories based at Sutton in Surrey. The laboratory provides an ultrastructural service to the Institute covering both transmission and scanning electron microscopy, with a considerable commitment to ultrastructural immunocytochemistry. In addition, the laboratory has a strong research programme on the structure of normal and neoplastic human breast epithelium.

Applicants should be qualified in biology, biochemistry or histology at 'A' level or above. Full training in all aspects of Electron Microscopy will be given.

Salary in the range of £5656 to £10711 depending on qualifications.

Applicants are advised that smoking is prohibited in the majority of the Institute's premises.

Further information on the post may be obtained from Dr. P. Monaghan on 01 643 8901 ext. 4631.

Applications should be sent in duplicate with the names and addresses of two referees to the **Personnel Officer, The Institute of Cancer Research, 17A Onslow Gardens, London SW7 3AL quoting reference number 1.89.T.N.62.** (8394)A

UNITED MEDICAL AND DENTAL SCHOOLS LECTURESHIP IN THE DIVISON OF PHARMACOLOGY AND TOXICOLOGY

Applications are invited for a Lecturer in the Division of Pharmacology and Toxicology. The post will be for 2½ years in the first instance with a possible extension for a further 3 years.

Teaching commitments will be primarily to pre-clinical medical students and there may be some adminstrative duties. The lecturer will be expected to pursue research in pharmacology. No particular line of research is required but the division has particular interests in psychopharmacology (Guy's Campus), electrophysiology of muscle, central transmitters and retinal degenerative diseases (St Thomas's Campus). The new lecturer will be based at the campus most appropriate for his/her area of research.

Intending applicants should have a first degree in medicine, pharmacology or related subject, a PhD or MD and must have the ability to present lectures, communications etc in a clear and interesting way.

Further information may be obtained from Professor M J Neal, Division of Pharmacological Sciences, UMDS, St Thomas's Campus on 01 928-9292 extn 2080. Salary will be on the lecturer scale Grade 'A' £9,260 – £14,500 or Grade 'B' £15,105 – £19,310 plus London Weighting Allowance, depending on age and qualifications.

Applications, with full curriculum vitae (six copies) and the names of two referees, should be sent to the: **Personnel Officer, UMDS, St Thomas's Campus, Lambeth Palace Road, London, SE1 7EH, quoting reference STH/PHAR/283 by 9th March 1989.** (8397)A

UNIVERSITY OF LEICESTER
Department of Physics and Astronomy
RESEARCH APPOINTMENT IN X-RAY ASTROPHYSICS

Applications are invited for a SERC-supported post-doctoral research post in the X-ray Astronomy Group at Leicester University. The research activities of the group include observational programmes in X-ray astrophysics based on the Japanese/UK satellite GINGA, detailed preparations for the launch in February 1990 of the German/USA/UK satellite ROSAT, and the development of X-ray instrumentation for future missions such as SPECTRUM-X, AXAF and XMM.

We are interested in a person with experience in either observational astronomy, astrophysical data analysis or theoretical astrophysics. The successful candidate will be expected to develop a strong astrophysics research programme concentrating either on the facilities offered by ROSAT or ground-based support of the ROSAT programme. Some intitial commitment to the development of the software system for ROSAT data analysis may be required.

The appointment will be for up to three years. The salary, depending on age and experience, will be in the range £9,865 – £13,870 (under review) plus USS benefits.

Applications should be sent to **Professor K. A. Pounds CBE FRS, Department of Physics and Astronomy, University of Leicester, Leicester, LE1 7RH, together with a curriculum vitae and the names of two referees. The closing date is 15 March 1989.** (8416)A

Medical Writer

The success of tomorrow's technologies and products requires innovation and competence in today's research and development programmes – this is Hoechst High Chem, at the frontiers of science, technology and medicine.

Hoechst High Chem also means a highly motivated, multidisciplinary team of scientists to meet these challenges with ambition and skill in a demanding environment.

Applications are invited for the post of medical writer based at the company's headquarters in **Frankfurt.** This is a challenging opportunity for a young life scientist and native English speaker, interested in a career in medical writing and with a sound basis in the German language.

The position will involve writing and editing manuscripts for publication, and preparing in-house information and international registration dossiers.

Hoechst High Chem

Applicants should preferably be aged 25–35 and have a life science degree. Qualification to Ph. D. level would be a considerable advantage. Applicants must have the ability to express medical data accurately and concisely in English and have previous experience of writing and/or publishing scientific material.

Hoechst AG is one of the world's leading chemical companies with a very successful pharmaceutical division. The successful applicant will be attached to the Clinical Research Department and will report to the Medical Editor.

The position offers a competitive salary and a wide range of benefits including a substantial bonus and assistance with removal expenses.

If you are interested, please forward your curriculum vitae to

Hoechst AG

THE UNIVERSITY OF LEEDS
DEPARTMENT OF PURE AND APPLIED BIOLOGY
POSTDOCTORAL RESEARCH FELLOW

Applications are invited for the above post, available immediately for a fixed term of 2 years, for an investigation of the process of nematode invasion into plant roots. Specifically the project will examine the mechanism and efficiency of novel methods of nematode control. The project is funded by Shell Research.

Applicants must have a PhD in a biological subject and a proven record in research.

Salary on RA IA scale for Research and Analogous Staff within the range (£9865-£11680) according to qualifications and relevant experience.

Informal enquiries may be made to Dr Howard Atkinson (tel (0532) 332900).

Application forms and further particulars may be obtained from and completed applications forwarded to the **Registrar, The University of Leeds LS2 9TJ (tel (0532) 333963)** quoting reference number 56/24. Closing date for applications 9 March 1989. (8422)A

UNITED MEDICAL AND DENTAL SCHOOLS
(Guy's Campus)
POSTGRADUATE RESEARCH ASSISTANT – 1B

Required by the Division of Anatomy to work with a group studying the early development of the brain in higher vertebrate embryos. The successful applicant will be primarily responsible for operating a laser scanning confocal microscope and for helping in the development and application of this new technique. Technical experience not essential as training will be given. Background and interest in developmental biology and computing would be an advantage.

Starting salary up to £10,910 pa inclusive. Appointment for three years in the first instance.

Further information from Dr A G S Lumsden on 01-407 7600 ext 3359. Applications including a full CV with the names of two referees to **The Personnel Officer, UMDS, St Thomas's Campus, Lambeth Palace Road, London SE1 7EH quoting reference G/AT/289.**

Closing date 3 March. (8388)A

ROYAL HOLLOWAY AND BEDFORD
NEW COLLEGE
University of London

Cognitive Neuropsychologist/Clinical Neuropsychologist

A post doctoral or post clinical research fellow is sought in cognitive or clinical neuropsychology to develop studies of developmental disorders of cognition in collaboration with Dr Christine Temple.

The appointment will be for one year initially but extendable to three, subject to suitable progress. The post will be funded by a Research Award from the Wolfson Foundation.

Letters of application and a curriculum vitae, including the names of two referees, should be made to **Dr C Temple, Department of Psychology, Royal Holloway and Bedford New College, Egham Hill, Egham, Surrey. TW20 0EX. Applications should be made by 28th February, 1989.** (8398)A

TRANSGENE

MICROBIOLOGIST (Post Doctoral) **STRASBOURG FRANCE**

We are looking for an experienced PhD Microbiologist with a strong background in the molecular genetics of lactic acid bacteria or gram+ organisms (bacilli, corynebacteria) to join our Microbiology Division and take an active part in our research programmes involving the application of the newest genetic engineering techniques.

Interested candidates are invited to submit, in confidence, a full CV, the names and addresses of three referees, an indication of salary requirements and quoting ref. No. MD91 to:

TRANSGENE

DIRECTOR OF RESEARCH IN GEOLOGY

The Ecole des Mines de Paris is recruiting a Director of Research to be in charge of the Centre de Géologie Generale et Miniere.

Applicants should have experience in leading a scientific team and should be experts in applied geology (metallogeny, geochemistry, petrology, modelling, sedimentology, etc.). Preference will be given to geologists with an engineering background.

A sufficient knowledge in French is required.

Candidates should send their C.V. to the **Direction des Recherches, Ecole des Mines de Paris, 60 bd St Michel, 75272 Paris Cedex 06, before 1st March 1989.** (W5870)A

INSTITUTE OF PLANT SCIENCE RESEARCH CAMBRIDGE LABORATORY

Plant Biologist/Geneticist

The laboratory has a vacancy for a Post-doctoral scientist to join a group working on gene dispersal from transgenic plants. The aim is to assess the likelihood and consequence of transfer of genes from transgenic plants to other plants and organisms. The person appointed will be expected to transform plants, including the legume, alfalfa, and carry out glasshouse and field experiments to test the frequency of cross pollination. Experience with Rhizobium genetics would be an advantage.

The position is funded by the EEC for a period of two years.

Initially the appointee will be located at the Cambridge Laboratory but in March 1990 he or she will be re-located together with other staff to new laboratories on the John Innes site at Norwich.

Salary will be on the Higher Scientific Officer scale £10,026 p.a. to £13,460 p.a. a starting point depending on qualifications and experience.

Applications with full CV and the names of three referees to **Mrs L Cliff, Institute of Plant Science Research (Cambridge Laboratory), Maris Lane, Trumpington, Cambridge CB2 2JB quoting reference no. PB/351 by 6th March 1989.**

The Institute is an Equal Opportunities Employer (8419)A

UNIVERSITY OF CAMBRIDGE
Department of Physics
University Assistant Lecturer in Experimental Particle Physics

Applications are invited for the post of University Assistant Lecturer in the High Energy Physics Group of the Cavendish Laboratory. The research programme of the group is currently centred upon the OPAL experiment at LEP, the UA2 experiment at the CERN proton-anti-proton collider and the development of electronic detectors for particle physics.

It is hoped that the successful candidate will take up appointment by 1st October 1989, or as soon as possible thereafter. The appointment is for three years, with the possibility of reappointment for a further two years. The statutory limit of tenure of a University Assistant Lectureship is five years, but all holders of the office of University Assistant Lecturer are considered for possible appointment to the office of University Lecturer during the course of their tenure.

The pensionable scale of stipends for a University Assistant Lecturer, not ordinarily resident in College, is £10,460, rising by seven annual increments to £14,500.

Further information may be obtained from the **Secretary of the Appointments Committee for the Faculty of Physics and Chemistry, Institute of Astronomy, Madingley Road, Cambridge CB3 0HA, England,** to whom applications (ten copies), including a curriculum vitae and the names of three referees, should be sent so as to reach him not later than 31st March 1989. (8414)A

UNIVERSITY OF ABERDEEN
DEPARTMENT OF OPTHALMOLOGY
RESEARCH ASSISTANT

The post is funded by ICI Pharmaceuticals to examine the effects of the aldose reductase inhibitor, Statil, on the function and cell behaviour of retinal capillary endothelial cells and pericytes, as part of broader studies into the pathogenesis of diabetic retinopathy. The post is available for 2 years and eligible candidates should have an Honours Science Degree. The successful candidate will be encouraged to aim for a Higher Degree.

Starting salary within the range £8,675 – £11,680 on the IB Scale for Research and Analogous Staff.

Further details and application forms from the **Personnel Office, The University, Regent Walk, Aberdeen AB9 1FX (tel 0224 273500) to whom applications (2 copies) should be returned by 10 March 1989 quoting reference number LW/004.** (8386)A

UNIVERSITY OF SUSSEX
SCHOOL OF BIOLOGICAL SCIENCES
NEUROPHYSIOLOGIST/CELL BIOLOGIST/ MOLECULAR BIOLOGIST/BIOPHYSICIST

Two postdoctoral fellows/research officers are required to join a research group investigating sensory processing mechanisms in the mammalian cochlea. The group works in a well equipped laboratory with good technical support and specialist training is available in a wide range of techniques.

The appointments are for three years and the salaries will be according to age and experience over the range £8,675-19,310.

Please send a CV and the names of at least two referees to **Professor I.J. Russell, School of Biological Sciences, University of Sussex, Falmer, Brighton BN1 9QG, England.**

AN EQUAL OPPORTUNITY EMPLOYER (8438)A

Molecular Science

As part of our expanding research and development programme, a new group has been established to exploit molecular biology techniques within the Division of Cellular and Molecular Sciences. The Division is engaged in a variety of drug discovery programmes covering therapeutic areas such as cancer, immunology and metabolic diseases. Two positions are vacant:

Principal Biologist

You will supervise the work of the group, which will comprise five scientists engaged in the study of gene expression using the latest technology (e.g. PCR amplification) for this purpose.

You will have several years' post-doctoral experience (or equivalent) in a related field, and proven supervisory ability. Reference G89025.

Senior Biologist

Working with the team, you will take responsibility for various sections of the project depending upon experience which is likely to include a PhD and experience in an industrial or academic environment. Reference G89026.

Both positions offer excellent remuneration packages and, where applicable, relocation assistance, together with a wide range of benefits provided by the world's largest ethical pharmaceutical company.

Please send a full c.v. or telephone for an application form by contacting Ted Smith, Senior Personnel Officer, Glaxo Group Research Ltd, Greenford Road, Greenford, Middlesex UB6 0HE. Telephone 01-422 3434, ext. 2934, quoting the appropriate reference number.

DEPARTMENT OF ANIMAL SCIENCE

LECTURER IN MOLECULAR GENETICS

Applicants should have a PhD or equivalent qualification with expertise in eucaryotic molecular genetics. Applicants should have experience in some aspects of recombinant DNA technology (including gene isolation and cloning, gene expression or nucleic acid sequencing), demonstrated research experience in areas of gene expression, gene regulation, gene mapping or genome organisation, and an interest in applications of molecular genetics in population/evolutionary genetics or in quantitative genetics and animal breeding.

The Department of Animal Science is responsible for all genetics teaching in the University, and the appointee will be expected to establish an independent research program, to supervise postgraduate students and to teach undergraduates; the latter with particular responsibility for a Molecular Genetics course in the Faculty of Science. The Department has a wide range of research programs in Genetics, and extensive facilities, including a fully equipped Molecular Genetics laboratory.

SALARY: Commencing salary will be determined in accordance with qualifications and experience – $A30,737-$A40,100.

CLOSING DATE: 16th March, 1989.

POSITION No.: 433.

FURTHER ENQUIRIES: Professor Barker, telephone 61 67 73 2225.

Applications should be addressed to the Staff Officer and include names and addresses of three referees and state position number. Referees should be given a copy of this advertisement and asked to write direct to the Staff Officer by the closing date and quote position number. (W5877)A

ARMIDALE, NSW 2351
AUSTRALIA

HEAD OF CELL SERVICES (ASSOCIATE SCIENTIST)

The Imperial Cancer Research Fund is one of the largest independent cancer research organisations in Europe. It is a major user of mammalian cell tissue culture, having a highly developed Central Cell Production service to support the research laboratories in the Fund's many locations in the United Kingdom, particularly London, South Mimms, Hertfordshire and Oxford.

We are seeking an experienced post-doctoral scientist to set up and run a mammalian cell tissue culture Research and Development Laboratory.

The primary aim of the laboratory will be to study various aspects of cell growth and production and downstream processing. In particular, research will be centred on the identification and development of new procedures in relation to the growth of mammalian cells in culture and the isolation and purification of cell products. This may be on one or more particular cell types, eg. monoclonal antibody producing hybridomas.

This is a demanding research appointment that will require innovative input. The successful candidate will be at post-doctoral level and have a good scientific background including experience in mammalian cell tissue culture. Particular expertise in a number of the following areas is necessary: cell metabolism, differentiated cell lines, growth factors, genetic manipulation, biochemical dynamics, growth matricies, hybridoma growth, monoclonal antibody production.

She/he will also be responsible for ensuring that the Central Cell Service is kept up-to-date with developments in methodology and technology in relation to the growth of mammalian cells and the isolation of cell products. The person appointed will also have overall responsibility for the Central Cell Service, although this will be through a Deputy Head who will be responsible for the day-to-day management of the service.

This is a new tenured research appointment and the laboratory will be based at our recently opened laboratories at Clare Hall, South Mimms, Hertfordshire.

Salary range: Associate Scientist £13,328-£21,918 inclusive.

Application should be made by sending full C.V. with names and addresses of three referees to the Recruitment Officer, Imperial Cancer Research Fund, Lincoln's Inn Fields, London WC2A 3PX quoting reference 75/R.

Smoking is actively discouraged. (8448)A

IMPERIAL
CANCER RESEARCH FUND

POSTDOCTORAL RESEARCH POSITION
Molecular/Cellular Biology

A fully funded postdoctoral research position is available immediately to study the molecular mechanisms underlying cell growth and transformation (see: Cell 49, 78-82 1987; Nature 336, 22-29 1988). Applicants should send their curriculum vitae and names of references to:

Dr. Helen Piwnica-Worms
Department of Physiology
Tufts University
136 Harrison Ave.
Boston, MA 02111 (NW3312)A

CONSULTING

U.S. scientific consulting firm offering assistance in analysis of data and communication of findings in written reports and public presentations to a variety of forums seeks Ph.D.'s in biological and biochemical sciences and M.D.'s interested in worldwide consulting opportunities. Disciplines of interest include epidemiology, biostatistics, toxicology/pharmacology, cancer research, pathology, immunology, allergy, etc., and any of the medical specialties. Applicants will provide assistance on various projects. The position is intended for those people looking to supplement ongoing activities. Travel can be minimized. Retired individuals are welcome as are all academic professionals.

Please reply with résumé and rate structure to: **Chief Executive Officer, Suite 206, 3421 M Street, N.W., Washington, DC, USA 20007.**

JAMES COOK UNIVERSITY OF NORTH QUEENSLAND
Townsville, Australia

THE WILLARD C LACY CHAIR OF ECONOMIC GEOLOGY

After a comprehensive review of teaching and research in Geology, the University has decided to expand its activities in economic geology by creating a new Chair of Economic Geology, sponsored jointly with the exploration industry. In parallel with this initiative the University is also constructing a new research building to house applied research projects, as part of the development of a fully equipped central instrumentation facility.

The Department of Geology and its associated Economic Geology Research Unit (FGRU) constitute Australia's most concentrated research effort in economic geology. There are 18 academic staff and research fellows, and about 40 postgraduate students, who have attracted more than $1 million in external research funding in 1987-8. EGRU currently hosts a major AMIRA-funded project on epithermal gold exploration in North Queensland. Tin-tungsten exploration, structural controls on ore deposition, and coalbed methane development are other areas of research strength.

Applications are invited from suitably qualified persons for the position of Professor of Economic Geology. Applicants would be expected to possess a PhD in a relevant area, direct working experience of exploration geology and a substantial research record. The appointee will be required to vide strong academic and res leadership in Economic Ge and, as Director of EGRU, responsible for maintaining fostering relationships EGRU member companies with relevant Government professional organisations. direct knowledge of the Austr or southwest Pacific explor industry would be an advan Qualified applicants strengths in geostatistics, co ter applications in geoscien financial evaluation of mining tures are encouraged to apply University will, however, con applicants who can demons strength in any research field vant to Economic Geology.

The appointment to the C will be for a period of up to years.

Salary for the positio A$63,397 a year.

Initial enquiries may be ma confidence to Professor F Carter, Acting Director, EC on (077) 81 4536, or by FA (077) 25 1501.

Further particulars and apf tion forms are available Appointments (36010), Ass tion of Commonwealth Univ ties, 36 Gordon Square, Lo WC1H 0PF, or from the Regis James Cook University of N Queensland, Townsville, 4811, Australia, with whom a cations close on 31 March 198

Reference number 89037.

Quality in Clinical Research

"the future of successful drug development"

A major force in international pharmaceuticals my client has an enviable record for new product introduction, particularly over the last three years. With the requirements of the Regulatory Authorities becoming ever more stringent they are totally committed to ensuring that the Clinical Research process is faultless, giving new compounds the best possible chance of success.

To this end they now require a number of people to join their International Quality Assurance Group, based either in the Northern Home Counties or in Europe. Working within any part of the Clinical Research function you will be auditing and further developing Standard Operating Procedures to even higher levels of integrity.

To succeed you will have good experience in some part of the Clinical Research process, together with sharpened analytical and innovative skills that will enable you to develop new methods. You will be a qualified scientist and have the personality to influence international clinical teams. You will also be able to work alone on occasion.

If you feel ready to make a major impact on the shape of Clinical Research and the success of New Drug Approvals then send a full CV together with salary details, quoting ref **MD2074** to **Larry Botheras, Macmillan Davies, Salisbury House, Bluecoats, Hertford, SG14 1PU. Telephone (0992) 552552.**

MANAGEMENT SELECTION

Senior Research Scientist

THE CELL BIOLOGY OF SHOCK AND INFLAMMATION

Celltech is one of Europe's foremost biotechnology companies; based at new, purpose-built facilities in Slough, the company is already recognised as a world-leader in the bulk production of monoclonal antibodies and recombinant proteins for diagnostic and therapeutic use.

We are now looking for an experienced PhD scientist to undertake new research into endotoxic shock and inflammation. As well as working with research colleagues from within the company, you will also enjoy collaboration with academic institutions. This is an excellent opportunity to make a real contribution to pioneering research – and to prepare for greater managerial responsibility.

You must have between three and six years' post-doctoral research experience in cell biology/immunology, ideally in a cytokine-related area, and have extensive knowledge of some aspects of inflammation. Tissue culture experience is also desirable.

We offer a competitive salary backed by an attractive benefits package, including car loan and allowance, pension scheme, free life assurance and relocation assistance if appropriate. Continuing growth at Celltech is creating many interesting and rewarding career development opportunities for our scientists.

Please write, with full details of your qualifications and experience to date, to Mrs Jane Smith, BSc C BIOL MI BIOL, at Celltech Limited, 216 Bath Road, Slough, Berkshire SL1 4EN. Please quote Ref: 237.

The University of Calgary
Research in Signal Transduction

The University of Calgary Faculty of Medicine Cell Regulation Group invites applications for faculty positions at the Assistant Professor level or higher in the area of biochemical mechanisms in signal transduction.

Successful candidates will be expected to develop an independent research program in the general area of transduction processes, but priority will be given to applicants who propose to investigate guanine nucleotide binding proteins (G-proteins) and/or phosphoinositide turnover. Well qualified candidates will be eligible to apply for salary and establishment support by competitive application to the Alberta Heritage Foundation for Medical Research. Establishment support will cover the cost of setting up a new laboratory with both major and minor equipment, and operating funds for an initial two year period.

Applicants require an MD and/or PhD and research training at the postdoctoral level. Remuneration will be based on salary scales at The University of Calgary relative to training and experience. Successful applicants will have 75% of their time protected for research.

In accordance with Canadian immigration requirements, priority will be given to Canadian citizens and permanent residents of Canada. The University of Calgary is committed to employment equity.

Interested candidates should submit their curriculum vitae, names of three references and a letter stating their aims and research interests by March 1, 1989 to: **Dr. David Severson, Chairman, Cell Regulation Research Group, Faculty of Medicine, The University of Calgary; 3330 Hospital Drive N.W., Calgary, Alberta T2N 4N1 Canada.** (NW3277)A

THE UNIVERSITY OF MANCHESTER
RESEARCH ASSOCIATE IN RADIO ASTRONOMY

Applications are invited for the above postdoctoral post based at the Nuffield Radio Astronomy Laboratories, Jodrell Bank. Research associates are expected to take on some service responsiblities, but at least 50% of their time will be available for their own research. The main facilities at Jodrell Bank are the 76m Lovell telescope (used for single dish work, MERLIN, and VLBI) and the seven telescope (205km) MERLIN array. Jodrell Bank has a Starlink VAX 780 and an Alliant FX/8 computer. Current areas of research include image processing, radio and optical studies of active galaxies, and quasars, gravitational lenses, neutral hydrogen studies of galaxies, molecular lines, stars, and the microwave background.

Appointment tenable from October 1st, 1989, initially for a period of 2 years with possible extension up to 3 years (maximum).

Salary range £9,865 – £15,720 p.a. depending on age and experience.

Further enquiries to, and application forms from, **I. W. A. Browne, University of Manchester, Nuffield Radio Astronomy Laboratories, Jodrell Bank, Macclesfield, Cheshire, SK11 9DL. Closing date May 1st, 1989.**

The University is an equal opportunities employer (8390)A

Imperial College of Science Technology and Medicine
University of London

Condensed Matter Theorist

Applications are invited for two post-doctoral positions held in the physics department. The appointees, to commence on or before 1st October 1989, at a salary on the 1A scale (£9,865 to £15,720) plus London allowance of £1,650.

One post concerns electronic properties of solids and their surfaces and is for a period of 5 years with the possibility of further renewal. The other is for work on the structure of disordered surfaces and is for a period of 3 years. The Imperial College solid state physics theory group, one of the largest in the UK, has wide interests ranging from surfaces, to transport in disordered systems, and spin glasses.

Applicants, who will have a PhD or expect to obtain one during 1989, are asked to send a curriculum vitae and list of publications. Three referees should be asked to write directly. For further information contact the head of the solid state theory group, **John Pendry, The Blackett Laboratory, Imperial College, London, SW7 2BZ, UK. (tel 01-589-5111 x6902).** Closing date: 31st March 1989. (8426)A

PUBLIC HEALTH LABORATORY SERVICE BOARD
PHLS CENTRE FOR APPLIED MICROBIOLOGY & RESEARCH

DIVISION OF BIOTECHNOLOGY

MOLECULAR GENETICIST

A research assistant is required to assist with work encompassing a wide variety of recombinant DNA techniques, as applied to procaryotic microorganisms. The successful candidate will join a well established team of scientists actively engaged in the application of recombinant methodology to products and processes of biotechnological interest. Basic laboratory experience and a degree, or equivalent, in a biological discipline would be an advantage.

Appointment will be made on the Basic Grade Microbiologist scale: £6,993-£10,496 (under review), for a period of 2 years.

NHS terms and conditions.

Candidates seeking further information should contact Dr N.P. Minton, tel: (0980) 610391, ext. 562.

Application forms can be obtained from the Personnel Officer, PHLS Centre for Applied Microbiology & Research, Porton Down, Salisbury, Wilts SP4 0JG. Tel: (0980) 610391 ext. 240, to whom completed forms should be returned by 3rd March 1989 quoting Post No. 0897. (8400)A

PhD STUDENT IN ENZYMOLOGY

SERC Postdoctoral Research Assistantship and Earmarked Research Studentship in Protein Engineering and Enzyme Mechanism. These two positions are available for 3 years from October 1989 for work on fundamental aspects of enzyme mechanism and molecular recognition, using the cysteine proteinase family of enzymes and mutants produced by site-directed mutagenesis. Applicants for the Postdoctoral position (£12,110-£13,330 p.a. inclusive of LW) should have experience or interest in molecular biology and those for the Studentship interest in structure-reactivity relationships and a good degree in Biochemistry or Chemistry.

Applications with CV and the names of two referees to:
Professor K. Brocklehurst or Dr. I. Phillips, Dept. of Biochemistry, St. Bartholomew's Hospital Medical College, University of London, Charterhouse Square, London EC1M 6BQ as soon as possible. (8410)A

UNIVERSITY OF OXFORD

INORGANIC CHEMISTRY LABORATORY
in association with St. Hilda's College or St. Catherine's College.

UNIVERSITY LECTURERSHIP IN INORGANIC CHEMISTRY

Applications are invited for a University lecturership in Inorganic Chemistry tenable with effect from 1 October 1989. Applicants may work in any branch of inorganic chemistry, including its borders with surface science, solid-state science, and biology. The successful candidate may be offered a tutorial fellowship by St. Hilda's College or St. Catherine's College on the terms described in the further particulars. Separate application need not be made for the college appointment. It is hoped to fund this appointment from money made available by the UGC under its new academic appointments scheme (NAAS). Under the conditions of the scheme the successful candidate will normally be near the start of an academic career and under 35.

Further particulars of the lecturership and of the college fellowships may be obtained from **Professor M. L. H. Green, Inorganic Chemistry Laboratory, South Parks Road, Oxford, OX1 3QH,** to whom a *curriculum vitae* and the names of three referees should be submitted by 28 February 1989.

UNIVERSITY LECTURERSHIP IN PLANT SCIENCE
in association with Pembroke College

Applications are invited for the above post to be filled from 1 October 1989. Preference will be given to candidates with an interest in Plant Biochemistry/Molecular Biology. Stipend according to age on the scale £9,260 to £20,615 per annum. The post may be held jointly with a stipendiary tutorial fellowship at Pembroke College. It is hoped to fund this appointment from money made available by the UGC under its new academic appointments scheme (NAAS): under the conditions of the scheme the successful candidate will be near the start of an academic career and under 35.

Applications (8 copies, or one from overseas candidates) should be sent by 3 March 1989 to **Professor F. R. Whatley, FRS, Department of Plant Sciences, South Parks Road, Oxford, OX1 3RA,** from whom further particulars may be obtained.

OXFORD CENTRE FOR MOLECULAR SCIENCES
POSTDOCTORAL RESEARCH ASSISTANT
PROTEIN CRYSTALLOGRAPHY

Applications are invited for the post of protein crystallographer whose general role will be to provide support for the collaborative crystallographic research programme of the Centre of Molecular Sciences based in the Laboratory of Molecular Biophysics under the direction of Sir David Phillips. The person appointed will have major responsibility for selection implementation and running of a new data collection facility (e.g. electronic area detector or image plates). The position allows scope for the development of independent research. Several years postdoctoral experience is required.

The post is funded until 30 September 1994 and is available immediately on the scale RAII (£14,500 – £19,310). If no suitable applicant is forthcoming, an appointment on the scale RA1A (£9865 – £15,720) may be considered, with an appropriate adjustment of duties.

Applications in writing with full CV and 2 referees should be made to **The Administrator, Oxford Centre for Molecular Sciences, c/o Dyson Perrins Laboratory, South Parks Road, Oxford OX1 3QY,** from whom further details of the post can be obtained.

Closing date: 3 March 1989. (8420)A

The University is an Equal Opportunity Employer

POSTDOCTORAL POSITIONS —

analysis, identification and biocatalysis of fermentation byproducts

Three postdoctoral positions are available immediately to study byproducts obtained from fermentations. One position will be concerned with analysis and identification of fermentation byproducts; experience in separation of organic and inorganic compounds by all forms of chromatography including ion exchange, adsorption, electrophoresis, GC, HPLC, as well as other physical separation methods including distillation, lyophilization, liquid:liquid partitioning essential; must be familiar with spectral methods of analysis. Two positions will investigate the application of biocatalysis to compounds commonly found in fermentation wastes; experience will require a combination of skills including cultivation of microorganisms, fermentations, microbial transformations, and applied enzymology in the synthesis of organic chemicals; applications must have demonstrated expertise in metabolite production. All applicants must have demonstrated expertise in isolation (HPLC, TLC, GC), and in the identification of structures using NMR (carbon, proton), mass spectrometry, UV, IR.

Send resume and two letters of reference to **Professor Rex Montgomery, 200G HBRF, College of Medicine, University of Iowa, Iowa City, IA 52242. (319) 335-8067.** The University of Iowa is an equal opportunity, Affirmative Action Employer. Women and minorities are encouraged to apply. (NW3334)A

UNIVERSITY OF CAMBRIDGE

University Assistant Lecturers

in the Department of Physics

Several University Assistant Lecturers to take up appointment by 1st October 1989, or as soon as possible thereafter. Applicants will be expected to work in any aspect of physics but some preference will be given to those with interests in the main fields where the department is already active *viz* experimental and theoretical condensed matter physics, radio and millimetre wave astronomy, experimental and theoretical high energy physics.

A University Assistant Lecturer is appointed for three years, with the possibility of reappointment for a further two years. The statutory limit of tenure of a University Assistant Lecturer is five years, but all holders of the office of University Lecturer are considered for possible appointment to the office of University Lecturer during the course of their tenure.

The pensionable scale of stipends for a University Assistant Lecturer, not ordinarily resident in College, is £10,460 rising by seven annual increments to £14,500.

Further information may be obtained from the **Secretary of the Appointments Committee for the Faculty of Physics and Chemistry, Institute of Astronomy, Madingley Road, Cambridge, CB3 0HA**, to whom applications (ten copies), including a *curriculum vitae* and the names of three referees, should be sent so as to reach him not later than 31st March 1989. (8413)A

UNIVERSITY OF LIVERPOOL

Department of Geography

Applications are invited for two Lectureships in Physical Geography which it is hoped to fill under the U.G.C. New Academic Appointments Scheme. The Department is anxious to attract applicants with outstanding research achievements and promise. Preference will be given to candidates with research and teaching interests in one or more of the following fields: Remote Sensing; Coastal Geomorphology; Surface Processes (especially Soil and Water Chemistry). Informal enquiries may be made to Professor F. Oldfield, Tel. 051-794 2838.

Initial salary within the range £9,260 – £11,680 per annum on the Lecturer A scale.

Successful applicants will be appointed from 1st August 1989, or as soon as possible thereafter. Whilst there is no formal age limit, in accordance with the terms of the intitiative to bring younger staff into the profession, it is likely that preference will be given to candidates at an early stage in their careers.

Applications, together with the names of three referees, should be received not later than 10 March 1989, by **The Director of Staffing Services (AS), The University, P.O. Box 147, Liverpool. L69 3BX, from whom further particulars may be obtained. Quote ref. RV/264/N**

An Equal Opportunity Employer (8384)A

CHARING CROSS AND WESTMINSTER MEDICAL SCHOOL (University of London)

DEPARTMENTS OF PSYCHIATRY AND BIOCHEMISTRY

GRADUATE RESEARCH ASSISTANT

required to work on a study of Gene Expression in Schizophrenia. Previous experience in molecular biology or histology would be an advantage but not essential. Salary on scale £8,675-£11,680 per annum plus £1,650 per annum London Allowance.

Further details can be obtained from Dr. J. de Belleroche (01-846 7052) and applications with a full curriculum vitae together with the names and addresses of two referees to be sent to **The Secretary, Charing Cross and Westminster Medical School, The Reynolds Building, St. Dunstan's Road, London W6 8RP,** to be submitted within three weeks of the appearance of this advertisement. (Quote Ref: 89/16.)

(8437)A

PHLS CENTRE FOR APPLIED MICROBIOLOGY & RESEARCH

DIVISION OF PATHOLOGY

RESEARCH ASSISTANT (Immunology) — Basic Grade or MLSO

The Division of Pathology has a substantial programme of research in AIDS and the immunodeficiency viruses supported by the MRC and the PHLS. The virological segment of a project to establish primate models is already well advanced. The models will be used for studies of the immune response following infection and for assessing vaccines and therapies. This post will provide support for a senior immunologist monitoring and analysing immune function and specific cellular responses following infection or vaccination. The work will involve handling tissues putatively infected with simian and human pathogens under category III containment conditions; analytical flow cytometry is available.

Applicants should ideally have experience in some areas of cellular immunology with an understanding of basic immunology and host responses to viruses. Experience in lymphocyte culture techniques and/or phenotyping is desirable but training can be given in those areas as necessary.

Applicants should possess an honours degree or a recognised technical qualification.

The post is funded by the MRC (AIDS-directed programme) for a fixed term of approximately 3 years.

Salary scale £6,993–£10,496 per annum.

National Health terms and conditions apply.

For further information contact Dr L A E Ashworth tel: Idmiston (0980) 610391

Application forms can be obtained from the Personnel Officer, PHLS Centre for Applied Microbiology & Research, Porton Down, Salisbury, Wilts SP4 0JG

Tel: (0980) 610391, to whom completed forms should be returned by 3rd March 1989 quoting Post No 1133. (8415)A

THE OPEN UNIVERSIT' FACULTY OF SCIENCE

RESEARCH FELLOW: PHYSICS

Applications are invited for post of Research Fellow within Physics Department, to work o project concerned with the me urement of directional emittan The successful candidate develop and use equipment measure the emittence of a vari of materials with accurac approaching those of standa laboratories, and will also co pare the measurements with ex ing theories of material surfac Among the materials to be inve gated are: coated glasses (of p ticular interest to the Europ glass industry); materials to act standards in the middle infra r materials for infra red instrum tation; and minerals of interest planetary science, includ remote sensing.

The work is particularly suita for someone who would enj working with considerable au nomy in a small research group.

Candidates should have a go honours degree in physics, appli physics or in a closely related ar of engineering or technology, a a Ph.D. degree (or have recen submitted a Ph.D. thesis) in exp imental science or technolo particularly in one of the followi areas: optics; radiometry; mid infra red spectrometry; emis metry.

The post is available for t years from 1st October 19 Starting salary will be on the scale for Research Staff: £9865 £15720 at a starting point up £11070 per annum (at prese rates).

Application forms can obtained from Mrs. B. Wood (8044/2), Faculty of Science, Wi pey II, The Open University, W. ton Hall, Milton Keynes, MI 6AA or telephone Milton Keyn (0908) 653993: there is a 24-ho answering service on 653868.

Closing date for applicatior 6th March.

Equal Opportunity is Universi Policy (8395)A

UNIVERSITY OF BIRMINGHAM
SPACEFLIGHT INSTRUMENTATION FOR THE SPECTRUM-X MISSION (Ref PH2015)

A SERC-funded research vacancy exists in the School of Physics and Space Research for either a postgraduate Research Associate or a postdoctoral Research Fellow. The successful candidate will work on the development of the flight hardware and/or the on-board software for an X-ray telescope to be flown on the Soviet SPECTRUM-X mission in 1993. Applications are invited from honours graduates, or persons who have recently obtained a higher degree, in Physics or a relevant engineering discipline. It is anticipated that the successful applicant will have some experience in the development of microprocessor systems. The post is to be filled as soon as possible and is tenable for 3 years. The starting salary will be on the Research Associate 1B scale, £8,675–£11,680, or on the first four points of the Research Fellow 1A scale, £9,865–£15,720, as appropriate.

For further particulars of the above post and an application form, telephone 021-414 6383 quoting reference number PH2015. Applications (3 copies) should be sent to the **Senior Assistant Registrar, Faculty of Science, PO Box 363, Birminham B15 2TT** by 3 March 1989.

An Equal Opportunities employer

(8434)A

GEOCHEM GROUP LIMITED, CHESTER STREET, SALTNEY, CHESTER CH4 8RD
TEL: 0244 671121
ISOTOPE SPECIALIST

Applications are invited for a position in our rapidly expanding mass spectrometry department based at our laboratories in Chester.

The professional we are seeking will have proven experience in the measurement of the stable isotopes of Carbon, Sulphur, Oxygen, Hydrogen and Nitrogen. Knowledge of the relevant preparation techniques is essential.

Reporting to the manager of Mass Spectrometry, the successful applicant will be responsible not only for the routine operations of our busy isotope laboratory but will be expected to develop Geochem's isotope service. In addition the post carries a significant involvement in research and development.

An attractive salary (negotiable according to age and experience) is offered, together with a comprehensive package of benefits. Applicants should write, enclosing a detailed C.V., to **Gareth Harriman, Mass Spectrometry Manager** by no later than 6th March. (8442)A

UNIVERSITY OF LIVERPOOL
Department of Genetics and Microbiology
Senior Research Assistants/Research Associates

Two positions are immediately available in a laboratory using the filamentous fungus *Aspergillus nidulans* to study aspects of eukaryotic DNA repair and control of the cell cycle.

Position 1 is a three year post, funded by the Wellcome Trust, to clone, sequence and further characterize genes involved in the repair of alkylation damage in DNA.

Position 2 is initially a one year post, extendable for a further two years, using recombinant DNA techniques to assess the feasiblity of identifying human DNA repair and cell cycle genes by complementation in *Aspergillus nidulans*.

Applicants for both posts should have, or expect to gain shortly, a Ph.D. in a relevant area of research.

Initial salary for both posts will be within the range £9,865 – £13,365 per annum.

Informal enquiries should be made to Dr. P. Strike on 051-794 3620.

Applications, together with the names of three referees, should be received not later than 3rd March 1989, by **The Director of Staffing Services (AS), The University, P.O. Box 147, Liverpool. L69 3BX, from whom further particulars may be obtained. Quote ref. RV/254/N**

An Equal Opportunity Employer (8387)A

---

serc **SEPARATIONS INITIATIVE**

CO-ORDINATOR FOR BIOSEPARATIONS RESEARCH

The SERC Separation Processes Initiative is a major managed programme of research into separation and purification technology. This includes research into selective absorption, membrane separations, highly selective separations and mechanical methods.

The role of the Co-ordinator (for the biotechnological aspects of the programme) will be to stimulate research proposals and co-ordinate the activities of the research groups in the programme. This will involve liaison with the Membranes Co-ordinator and the provision of expert advice on biotechnology to the Programme Manager. Candidates should have experience of downstream processing in the biotechnology field, and those proposing secondment from an academic institution or industry are especially invited.

Please send full CV and covering letter to:
Neil Viner,
The Biotechnology Directorate,
Science and Engineering Research Council,
Polaris House, North Star Avenue, Swindon SN2 1ET
Telephone: (0793) 411279
Closing date for applications 20/3/89

This part-time, fixed term appointment will be for 2 years in the first instance with possible extension, and location by arrangement, although considerable travel will be required. Salary is negotiable (8452)A

ENDOWED PROFESSORSHIP IN MOLECULAR GENETICS

The University of Cincinnati and the State of Ohio have created an endowed professorship in the area of Molecular Genetics. This professorship, named the Ohio Eminent Scholar, is designed to add an outstanding scientist to the newly formed Department of Molecular Genetics, Biochemistry and Microbiology in the College of Medicine. Areas of interest include immunology, differentiation and development and human genetics. The department has major research programs including the recent award of a Program of Excellence in Molecular Biology from the Heart, Lung and Blood Institute of NIH. The Eminent Scholar will fulfill a pivotal role in expanding strength and interactions in the College. The University of Cincinnati is a comprehensive university in the state system. Curriculum vitae should be sent to:

Dr. Jerry B Lingrel
Department of Molecular Genetics, Biochemistry & Microbiology
University of Cincinnati
College of Medicine
Cincinnati, Ohio 45267-0524

Affirmative Action/Equal Opportunity Employer (NW3317)A

RESEARCH POSITIONS
IN MOLECULAR/CELL BIOLOGY

Post-doctoral or Assistant professor level positions are available immediately in the Department of Cell Biology. The person(s) appointed will be member of an English-speaking research group investigating the role of oncogenes and their interactions with carcinogens in normal and HBV-infected hepatocytes in culture and in transgenic mice, and on mechanisms underlying the control of hepatocyte-specific gene expression.

Applicants with an excellent background in general biochemistry and molecular/cell biology should have experience in one of the following areas: general cell culture techniques; recombinant DNA techniques; virology. Salary is negotiable and will be based upon the candidate's previous training and experience (BATIIa/BATIb). Initial appointments will be made for 2 years with possibilities for extension for additional 2 years or for permanent appointments. Send CV and names of at least 2 referees before March 15 1989 to: **Prof. Dr. Dieter Paul, Department of Cell Biology, Fraunhofer Institute of Toxicology, 3000 HANNOVER 61, Nicolai-Fuchsstrasse 1, Federal Republic of Germany.**

(W5842)A

LONDON BIOTECHNOLOGY LTD

Molecular Biologist/Enzymologist required immediately to work on 2-year contract involving site-directed mutagenesis of an enzyme. Candidates must have laboratory experience of (1) gene cloning and other relevant molecular biology techniques, (2) enzyme assays and kinetic analysis. Qualifications: minimum of MSc in relevant area. Salary £8675 (year 1) and £9260 (year 2) both plus £1450 L.A. Send application and full c.v. to **Dr M R Hollaway, Biochemistry Dept, University College London, Gower Street, London WC1E 6BT. or telephone 01-387 7050 xt. 7033.** *Equal Opportunities Employer.*

(8436)A

UNIVERSITY OF NEWCASTLE UPON TYNE
DEPARTMENT OF CHEMISTRY

Applications are invited for the newly established LECTURESHIP to be filled from a date to be arranged. The successful candidate will be expected to work closely with the incoming Professor of Physical Chemistry, Dr A Hamnett and should, therefore, have an interest in Modern Electrochemical and Spectroscopic Techniques.

Salary will be at an appropriate point on either Lecturer Grade A £9,260-£14,500 p.a. or Grade B £15,105-£19,310 p.a. according to qualifications and experience.

Further particulars may be obtained from the **Senior Assistant Registrar (Establishments), The University, 6 Kensington Terrace, Newcastle upon Tyne, NE1 7RU,** with whom applications (three copies), with the names and addresses of 3 referees, should be lodged not later than 22nd March 1989. (8439)A

FIELD MUSEUM OF NATURAL HISTORY
Paleontologist

Applications are invited for a career-track position in paleontology, preferably at the level of assistant curator. Specimen-oriented research is required in invertebrate or vertebrate paleontology, paleobotany, or related fields. Our principal criteria are research excellence and an ability to interact with staff in other areas of paleontology. Responsibilities also include curation of relevant collections, limited participation in exhibition and education programs, and some administrative work.

The Department of Geology has 8 curatorial positions (7 in paleobiology) and 6 supporting positions. The department maintains extensive collections in nearly all areas of paleontology, and actively participates in the programs of universities in the Chicago area. Applicants should have a Ph.D. and should mail a curriculum vitae, description of current and future research program, and names of three references (with phone number, if possible) to: **Search Committee, Dept. of Geology, Field Museum of Natural History, Chicago, IL 60605,** by March 30, 1989. *An Equal Opportunity Employer.* (NW3318)A

PUBLIC HEALTH LABORATORY SERVICE BOARD
PHLS CENTRE FOR APPLIED MICROBIOLOGY & RESEARCH

PATHOLOGY SECTION
LEGIONELLA SECTION

BASIC/SENIOR GRADE MICROBIOLOGIST

A graduate or postgraduate is required to investigate the growth of *Legionella pneumophila* in biofilms of complex aquatic communities generated using continuous culture techniques. The project is ongoing and the vacancy exists due to staff regrading. The position is immediately available for a current duration of at least 13 months and involves collaboration with a major water authority.

A microbiology or biological sciences degree is preferred and experience of aquatic/medical microbiology or continuous culture would be advantageous.

Salary scale: Basic Grade Microbiologist, £7,825-£10,496 per annum. Senior Grade Microbiologist, £11,164-£14,591 per annum.

NHS terms and conditions.

Further information may be obtained from Dr C.W. Keevil or Dr J.V. Lee tel. (0980) 610391.

Application forms can be obtained from the Personnel Officer, PHLS Centre for Applied Microbiology & Research, Porton Down, Salisbury, Wilts SP4 0JG. Telephone (0980) 610391 ext 240, to whom completed forms should be returned by 3rd March 1989 quoting Post No 0627. (8399)A

Signal Transduction/ Cell-Cell Interactions

Post-doctoral position available to study chemotaxis and cell-cell contact. Projects include studies of the chemotactic receptor and its kinase (Meier and Klein, PNAS **85**, 2181, '88), GDP-modulated phosphorylation and relation to G protein (Anschutz, et al., PNAS, in press) and glycolipid anchoring of cohesion molecules (Sadeghi, et al., PNAS **85**, 5512, '88).

Send CV and addresses of three references to: **Dr. Claudette Klein, E.A. Doisy Dept. of Biochemistry, St. Louis Univ. Medical School, 1402 South Grand Blvd., St. Louis, MO 63104.**

POSTDOCTORAL/ RESEARCH ASSOCIATE POSITION

Available immediately for Ph.D. or M.D. to study the function of the hematopoietic extracellular matrix. Projects include matrix purification, the interaction of matrix with hematopoietic growth factors, and the effects of drugs on bone marrow function.

Please submit curriculum vitae, a brief description of research experience, and three letters of reference to: **Dr. Sharon Luikart, Department of Medicine, Box 325 University of Minnesota Hospitals and Clinics, Minneapolis, MN 55455.**

We are an Equal Opportunity Employer. (NW3315)A

POSTDOCTORAL RESEARCH POSITION IN ATMOSPHERIC CHEMISTRY

In the Biogeochemistry Department of the Max-Planck-Institute for Chemistry a research position is available in an interdisciplinary group studying the exchange of gasses between terrestrial ecosystems and the atmosphere.

The experimental approach includes plant physiology and micrometerological techniques to measure turbulent fluxes of gases above vegetated surfaces.

The applicant would be expected to have training in micrometerology and atmospheric chemistry. Experience in atmospheric trace gas analysis would be an advantage.

The institute offers outstanding research facilities and travel funds. The project is funded for three years with an initial 6 month probationary period. The position is available from March 1989. Salaries scale up to DM 58,000. Interested candidates should send C.V. and references to:

Prof. Dr. M. O. Andreae, Biogeochemistry Dept., Max-Planck-Institute for Chemistry, P.O. Box 3060, D-6500 Mainz, Federal Republic of Germany. (W5874)A

POSITION IN FLOW CYTOMETRY AND EXPERIMENTAL HAEMOPOIESIS RESEARCH

Leukaemia Research Fund Centre
Institute of Cancer Research, London

A position is available at the Chester Beatty Laboratories, Fulham Road, London, for an individual with experience in flow cytometry and cell sorting to join a group studying cellular and molecular aspects of haemopoietic stem cells. The person appointed will be responsible for a FACS 440 dual laser cell sorter and will participate fully in the research programme. The position could be suitable either for a post-doctoral scientist (salary range £13,130-15,950 p.a.) or a Senior Research Officer/Senior Technician (salary range £10,512-14,758 p.a.).

Applicants are advised that smoking is prohibited in the majority of the Institute's premises.

Applications in duplicate, with CV and names and addresses of two referees, should be sent to the **Personnel Officer, The Institute of Cancer Research, 17a Onslow Gardens, London SW7 3AL** quoting reference 2.89.S.N. 70 (8393)A

The Food and Drug Administration

The Food and Drug Administration is recruiting for the Director, Division of Virology in the Center for Biologics Evaluation and Research located in Bethesda, Maryland. The position is in the Senior Executive Service with a salary range of $68,700 to $76,400. The Director is responsible for directing a staff of 55 in assuring the safety and effectiveness of biological products used in the prevention, treatment and mitigation of viral and rickettsial diseases. Applicants must have: executive level experience in managing broad scientific research or regulatory programs; demonstrated strong leadership and managerial abilities in directing complex scientific programs; ability to deal effectively with high level governmental officials, the scientific and academic communities, medical and health-related organizations, representatives of the regulated industry and others; and the ability to implement equal employment opportunity programs. Applicants should have an M.D. degree with board certification or a Ph.D. in a related scientific discipline with post doctoral training and a national/international reputation in viral and rickettsial biological products or related disciplines.

If you are interested and want to be considered, send a curriculum vitae to: **Jim Keady, Division of Human Resources Management, Food and Drug Administration, Parklawn Building, Room 4B-09, 5600 Fishers Lane, Rockville, Maryland 20857.**

If you need more information, call Jim, collect on (301-443-1755).

This position can also be filled by current Commissioned Officers of the U.S. Public Health Service, or by former officers willing to rejoin the Corps.

Applications will be accepted until March 31, 1989.

An Equal Opportunity Employer. (NW3329)A

FACULTY POSITION

Applications are invited for a tenure-track position in the Division of Dermatology at Washington University School of Medicine. Applicants should hold an M.D., Ph.D. degree with post-doctoral experience, and have completed an internship. It is expected that the applicant will have a demonstrable potential to develop an independent research program in areas of cellular and/or molecular biology. The successful candidate will also be expected to undertake clinical dermatology training with the ultimate goal of board certification and sharing the clinical teaching responsibilities on an equal basis with the existing faculty. New laboratory space, start-up support and the facilities of the department are available. Applicants should send curriculum vitae and a brief statement of research interests to: **Arthur Z. Eisen, M.D., Head, Division of Dermatology, Washington University School of Medicine, 660 S. Euclid Avenue, St. Louis, Missouri 63110.** *An Equal Opportunity/Affirmative Action Employer.* (NW3324)A

ASSISTANT PROFESSOR

Tenure track position is available in the Department of Medical Microbiology and Immunology, Ohio State University College of Medicine, for either a retrovirologist or a viral immunologist interested in neurological disease. Opportunities to collaborate closely with other groups involved in viral immunology, molecular virology and neuroimmunology. The OSU Medical Center is one of the designated AIDS Clinical Trial Groups. Applicant should hold M.D. or Ph.D. degree and at least two years experience, and have a strong record of scholarly achievement. Will be expected to establish an active research program and participate in medical student and graduate teaching programs. Send curriculum vitae, a summary of research interests, and three letters of recommendation to: **Ronald Glaser, Ph.D., Department of Medical Microbiology and Immunology, The Ohio State University College of Medicine, 333 West 10th Avenue, Columbus, Ohio 43210.**

The Ohio State University of an Equal Opportunity/Affirmative Action Employer. (NW3331)A

SCOTTISH CROP RESEARCH INSTITUTE
Invergowrie, Dundee DD2 5DA

HIGHER SCIENTIFIC OFFICER (BAND I)
(21-month appointment)

TISSUE CULTURE AND CYTOLOGY DEPARTMENT

A plant scientist is required to explore the potential of asymmetric cell fusion in potato improvement. Knowledge of plant tissue culture techniques is required and experience of protoplast manipulation would be an advantage. A technical support worker is also available for this position.

Salary: £10,026–£13,460

Non-contributory superannuation.

Qualifications: First or upper second class honours degree in a related discipline with at least two years' relevant post-graduate research experience which may be a course of research and study leading to a Ph.D. degree.

The Institute is an equal opportunities employer.

Curriculum vitae complete with the names and addresses of three referees should be sent to **Mr I Paxton, Personnel Officer, by 3 March 1989** quoting the appropriate reference **(Ref. TCC/1/89)**. (8429)A

ASSISTANT/ASSOCIATE PROFESSOR POSITION, NEUROSCIENCE

Tenure track position in Department of Neuroscience available beginning 04/17/89. Primary teaching responsibilities will be Medical and Dental neuroanatomy and cellular/systems neuro-funded research program on the neurotoxicology of drugs of abuse with emphasis on neurophysiological/neuropharmacological techniques. Collaboration with other established laboratories investigating these issues is expected. Application, including curriculum vitae and the names of three references should be sent by 04/03/89 to **Don W. Walker, Ph.D., Department of Neuroscience, Box J-244, J.H.M.H.C., College of Medicine, University of Florida, Gainesville, FL 32610–0244.**

The University of Florida is an Equal Opportunity/Affirmative Action Employer

(NW3328)A

RESEARCH CHEMIST

To conduct the preparation of carcinogen DNA/RNA adducts as model reference compounds for chromatography characterization and spectral measurements utilizing knowledge in advanced organic, analytical and chromatographic sciences for use in the identification and structural elucidation of adducts resulting from the interaction of polycyclic aromatic hydrocarbons with DNA/RNA in vivo using fish as the model and in vitro studies. Chromatographic separation and study of optical isomers of a proprietary drug and separation of deoxynucleosides and penta, hexa, and octa derivatives of an ulcer drug. Salary: $23,750.00 per year/40 hour week. Requirements: Masters level degree with an emphasis in analytical chemistry. Applicant must submit evidence of one graduate project in organic chemistry and two or three letters of reference as to research abilities. Applications to: **John Scott, E.S. Supervisor, Job Service, P.O. Box 59, Jefferson City, Missouri 65104.** Refer to Job Order Number 238813. (NW3322)A

HUMBOLDT STATE UNIVERSITY

Lecturer Equivalent to Assitant Professor Community Ecology/ Conservation Biology

One-year temporary position. Ph.D. is required and university teaching experience is preferred. Candidates must have expertise in community ecology and/or conservation biology. Demonstrated interest in wildlife management and in manipulated populations preferred. Candidates with a strong background in mathematics, professional wildlife experience, and/or with an understanding of consumptive use of wildlife will be given preference. Demonstrated research experience in the appropriate specialties is essential. Applicants should submit a curriculum vitae (including reprints), transcripts of academic work, and three letters of reference to **Dr. Richard L. Ridenhour, Dean, College of Natural Resources, Humboldt State University, Aroata, CA 95521. Phone (707) 826-3561.** Closing date is 30 March 1989. *Humboldt State University is an Equal Opportunity/Affirmative Action Title IX Employer.* (NW3320)A

UNIVERSITY OF CANTERBURY
New Zealand

LECTURER IN MICROBIOLOGY
DEPARTMENT OF PLANT AND MICROBIAL SCIENCES

Applications are invited for the above position. Applicants should have a Ph.D. degree in Microbiology. Preference will be given to a candidate with research experience in non-medical microbiology and microbial metabolism. The appointee will be expected to contribute to the teaching of microbiology courses at all levels and first-year biochemistry, and to pursue an active research programme including the supervision of M.Sc. and Ph.D. students.

The salary for Lecturers is on a scale from NZ$35,000 to NZ42,500 (bar), NZ$44,000 to NZ$46,000 per annum.

Further particulars and Conditions of Appointment may be obtained from Appointments (36015), Association of Commonwealth Universities, 36 Gordon Square, London WC1H 0PF.

Applications close with A.W. Hayward, Registrar, University of Canterbury, Private Bag, Christchurch, New Zealand, on 28 April 1989. (W5883)A

POSTDOCTORAL POSITION

available for membrane transport studies and studies on structure-function analysis of a membrane transport protein. Requires expertise in protein biochemistry and molecular biology. Salary negotiable, commensurate with experience. Send letter of application, curriculum vitae and two references to: **Dr. Ada Elgavish, Department of Pharmacology, University of Alabama School of Medicine, Birmingham, Al 35294.** An Equal Opportunity/Affirmative Action Employer.

RESEARCH SCIENTIST (ASSISTANT PROFESSOR)

The Department of Medical Microbiology and Immunology, Ohio State University Medical Center, is seeking a person to work collaboratively with a research group in the area of central nervous system/immune system interactions. Applicant should hold an M.D. or Ph.D. degree with experience in an area concerned with neuroimmune interactions. Salary commensurate with experience. Submit curriculum vitae, including reprints, and three letters of recommendation to: **Ronald Glaser, Ph.D., Department of Medical Microbiology and Immunology, The Ohio State University College of Medicine, 333 West 10th Avenue, Columbus, Ohio 43210.**

The Ohio State University is an Equal Opportunity/Affirmative Action Employer. (NW3332)A

THE HANNAH RESEARCH INSTITUTE

IMMUNOLOGIST/ BIOCHEMIST

An immunologist or a biochemist with experience in immunology is required to investigate the autocrine control of milk secretion. The appointee will join a team within the Director's Research Group which is studying local mechanisms regulating mammary function. Techniques will include PLC, polyclonal and monoclonal antibody production, and radioimmunoassay and enzyme immunoassay development. The post is funded for 2 years.

Applicants should possess a first or upper second class degree in immunology, biochemistry or a related discipline, with at least 2 year's relevant experience.

Appointment will be at Higher Scientific Officer grade, with starting salary up to £10,994. A non-contributory superannuation scheme is operating.

Further details may be obtained from The Secretary, The Hannah Research Institute, AYR KA6 HL to whom applications, including the names of two referees should be forwarded by 3 March 1989 quoting reference HRI/165. (8453)A

Postdoctoral Associate

To apply molecular cell biological methods to study of lipid movement and lipid droplet interaction with membranes in differentiated mammary epithelial cells. Position available from 1 April, 1989. Initial appointment for one year with possible renewal for three additional years. Send CV and names, addresses and telephone numbers of three references to:

T. W. Keenan, Department of Biochemistry, Virginia Tech, Blacksburg, VA 24061 USA.

An equal opportunity/affirmative action employer. (NW3330)A

POSTDOCTORAL POSITION

available to study genetic defects resulting in enzyme deficiencies in UMP synthase and possible immune system defects associated with hereditary orotic aciduria. Other research involves analysis of the bifunctional domain structure of UMP synthase using site-directed mutagenesis and vector expression in bacterial and cell culture systems. Applicants with a strong background in molecular biology and/or protein biochemistry are preferred. Two to 3 years of funding is available starting at $22,000. Send curriculum vitae and names of three references to: **Dr. D. Parker Suttle, Department of Pharmacology, St. Jude Children's Research Hospital, 322 North Lauderdale, Memphis, TN 38101–0318.**

An Equal Opportunity/Affirmative Action Employer. (NW3323)A

Tokyo Institute for Immunopharmacology, Inc.

Junior and Senior Molecular Biologists/ Immunologists

The Institute is seeking molecular biologists with a strong background in mammalian genetic engineering, and is especially interested in candidates with experience in the construction and screening of genomic and cDNA library, gene expression in mammalian cells and/or establishment of transgenic mice. We also invite applications from cellular immunologists who have strong interest in macrophage development, and activation.

She/he is expected to have a Ph.D. with postdoctoral training or equivalent for senior positions, or a Ph.D. with lesser training for junior positions. The appointees will join an active research group involved in the study of molecular immunology, focusing on molecular mechanisms of macrophage development and activation.

Applicants should submit curriculum vitae, list of publications, description of research interests and letters of reference to:

Takeshi Yoshida, M.D., D. Med. Sci., Director, Tokyo Institute for Immunopharmacology, Inc., 3-41-8 Takada, Toshima-ku, Tokyo 171, Japan. (W5886)A

HUMBOLDT STATE UNIVERSITY

LECTURER EQUIVALENT TO ASSISTANT PROFESSOR COMMUNITY ECOLOGY/ CONSERVATION BIOLOGY

One-year temporary position. Ph.D. is required and university teaching experience is preferred. Candidates must have expertise in community ecology and/or conservation biology. Demonstrated interest in wildlife management and in manipulated populations preferred. Candidates with a strong background in mathematics, professional wildlife experience, and/or with an understanding of consumptive use of wildlife will be given preference. Demonstrated research experience in the appropriate specialties is essential.

Applicants should submit a curriculum vita (including reprints), transcripts of academic work, and three letters of reference to Dr. Richard L. Ridenhour, Dean, College of Natural Resources, Humboldt State University, Arcata, CA 95521. Phone (707) 826–3561. Closing date is 30 March 1989.

Humboldt State University is an Equal Opportunity/Affirmative Action Title IX Employer. (NW3335)A

AWARDS

UNIVERSITY OF BRISTOL Zoology Department

POST-GRADUATE AWARDS 1989

Applications are invited from new or prospective Graduates in Zoology or a related discipline for places in the following research areas:

Adaptive physiology of visual pigments. (Dr J.N. Lythgoe)

Rhythm of foraging activity in marine grazing molluscs. (Dr C. Little)

Neuropeptide function/action in neural cell cultures. (Dr L.W. Haynes)

Helicoidal ultrastructure of outer casings in cryptobiotic animals. (Dr A.C. Neville)

Photoperiodic control of seasonal breeding in birds. (Professor B.K. Follett)

Neurobiology of behaviour in amphibian embryos. (Dr A. Roberts)

Ecology and social behaviour of mammals. (Dr S. Harris)

Biochemical defences of marine organisms. (Dr T.E. Thompson)

Places funded by SERC will be available for suitable applicants. Applications to **Dr T.E. Thompson, Zoology Department, University of Bristol BS8 1UG.** (8455)N

continued on page 2

INSTITUTE OF CHILD HEALTH
University of London

PhD STUDENTSHIPS
(Minimum value £5900 p.a.)

Applications are invited for three newly-established PhD studentships to work in the following fields of research in the departments of Immunology (2) and Paediatric Genetics (1).

Cytokine regulation of immunoglobulin isotype switching and secretion in man. (Dr R Callard)

Molecular Genetics of Anglemans syndrome: a chromosomal syndrome associated with the deletions of chromosome 15. (Professor M E Pembrey and Dr S Malcolm)

The immunoregulatory function of antigen in the gastrointestional tract. (Dr M Turner and Dr S Strobel)

Both departments have a wide range of current research interests and have excellent laboratory facilities.

Candidates should normally be not more than 25 years of age on 1st October 1989 and have been ordinarily resident in the UK for a minimum period of 3 years, and either possess, or hope to obtain, a First or Upper Second Class Honours Degree in an appropriate subject.

Further information can be obtained from **The Registrar, The Institute of Child Health, 30 Guilford St, London WC1N 1EH. Telephone 01-242 9789 Ext: 2679.**

Applications in the form of a Curriculum Vitae and the names of two academic references should be submitted as soon as possible. (8445)F

University College London
The Galton Laboratory
Department of Genetics and Biometry

Ph.D. Studentship

Funded by the Tuberous Sclerosis Association of Great Britain, this studentship is available in the laboratory of Dr. Jonathan Wolfe. The student will attempt to clone the chromosome 9 linked gene for the disease tuberous sclerosis by 'reverse genetics'. This will involve making genomic and linking libraries from appropriate somatic cell hybrids, constructing long range physical maps of the relevant region by pulse field gel electrophoresis and isolating candidate genes.

Applicants should have, or expect to have, a first or upper second class honours degree in an appropriate subject.

Further information can be obtained from **Dr. J. Wolfe, The Galton Laboratory, 4 Stephenson Way, London NW1 2HE (01-387 7050) X 5076)** to whom applications including a curriculum vitae and the names and addresses of two referees should be sent by March 31st 1989.

Equal opportunities Employer. (8435)F

SCHOOL OF PHARMACY
UNIVERSITY OF LONDON
Department of Pharmaceutical Chemistry
POSTGRADUATE STUDENTSHIPS

A number of postgraduate studentships funded by SERC, Charities and private sources will be available in this Department for postgraduate studies commencing July-October 1989.

Remuneration depends on the source of funding and on age and experience and will be in the range at current rates of £3,630-£5,115 pa. Applicants for training in any branch of Pharmacy, Chemistry, Biochemistry and related subjects will be eligible.

Research areas include drug design, synthesis, spectroscopy, molecular graphics, pharmaceutical analysis, receptor and enzyme structure and function, immunochemistry, molecular parasitology, lipid biochemistry and neurochemistry.

Applicants should write directly to **Professor W A Gibbons, Head of Department of Pharmaceutical Chemistry, School of Pharmacy, University of London, 29-39 Brunswick Square, London WC1N 1AX.** (8449)F

THE INSTITUTE OF CANCER RESEARCH: ROYAL CANCER HOSPITAL
(UNIVERSITY OF LONDON)

A number of POSTGRADUATE RESEARCH STUDENTSHIPS, tenable for up to three years leading to the PhD degree of the University of London, will be available at the Institute of Cancer Research from 1 October 1989. The Institute is based on two sites, at Sutton, Surrey and in Chelsea, London, SW3, and its research work is carried out in close collaboration with the Royal Marsden Hospital. Projects offered for 1989 are:—

Cell and Molecular Biology: Structural and functional analysis of a transcription protein which binds to enhancers and promoters of erythroid-expressed genes (G. A. Goodwin).
Mechanisms of ras oncogene transformation (C. J. Marshall).
The role of cloned transcription factors in mammalian development and sex determination. (A. Ashworth).

Pathology: Structure and function of myoepithelial cells (B. A. Gusterson and P. Monaghan)
Molecular and biological analysis of human c-erbB-2 (B. A. Gusterson).

Radiotherapy Research Unit: The sensitivity of human tumour cells to radiation: underlying molecular mechanisms (G. G. Steel and T. J. McMillan).

CRC Biomolecular Structure Unit: Synthesis and evaluation of DNA sequence-specific compounds as potential anti-cancer agents (T. C. Jenkins).

CRC Laboratory, Drug Development: Synthesis of some S-adenosyl-L-homocysteine derivatives and their nucleoside precursors (M. Jarman and P. Serafinowski).
The synthesis of inhibitors of steroid biosynthesis for the treatment of hormone-dependent cancers.

Medicine, Experimental Unit: Generation of immune response to tumours using antibodies that bear an internal image of specific tumour antigenes (C. J. Dean).

Physics: Modelling of tumour physiology using Positron Emission Tomography (M. A. Flower and S. Webb).
Dose optimisation for conformation radiotherapy (S. Webb and W. Swindell).
Localisation, quantitation and editing in human and animal proton NMR spectroscopy (M. O. Leach).
The application of silicon radiation detectors to beta and gamma ray imaging (R. J. Ott).
Quantitative ultrasound imaging of tumour vasculature (J. C. Bamber and D. O. Cosgrove).
Perceptual assessment of medical images (J. C. Bamber and S. Webb).

Studentship stipends will be at the normal Research Council rates, plus a supplementation of £1000 pa. Candidates should have or expect to gain a I or II(i) Honours degree or a Master's degree. Further details are available in the postgraduate prospectus, which is obtainable, together with an application form, from **Miss D. Tharp (N), Dean's Office, Institute of Cancer Research, Haddow Laboratories, Costwold Road, Sutton, Surrey, SM2 5NG; Tel: 01-643-8901, ext. 4643.** (8389)F

UNIVERSITY OF GLASGOW
DEPARTMENT OF BIOCHEMISTRY
POSTGRADUATE RESEARCH STUDENTSHIPS

Applications are invited as soon as possible for approximately 16 postgraduate studentships of various types tenable from 1st October, 1989 to work in the following research groups:—

Molecular Pharmacology
Biochemical Immunology and Parasitology
*Enzymology and Protein Engineering
Control of Gene Expression
Biochemical Endocrinology
*Plant Biochemistry and Molecular Biology
Structure and Function of Membranes
*Microbial Biotechnology
Cardiac and Vascular Biochemistry
Neurobiochemistry

Some of the projects that are available will involve collaboration with clinical departments and others will have strong industrial connections. The Department has excellent facilities for a very wide range of types of research.

Further information may be obtained from **Dr. J. G. Lindsay, Department of Biochemistry, University of Glasgow, Glasgow G12 8QQ.** Telephone: 041-339 8855, Ext. 4720.

*Seven SERC 'earmarked' studentships have been awarded to individual staff members in the designated areas. (8404)F

THE UNIVERSITY OF SHEFFIELD

POSTGRADUATE RESEARCH STUDENTSHIPS

Applications are invited for postgraduate studentships tenable from 1st October 1989, or sooner.

The Department is multi-disciplinary and has excellent facilities for laboratory and clinical work. Research interests include studies on the control of secretion of pituitary hormones: the action of growth factors, cytokines and neurotransmitters: the control of calcium and phosphate metabolism in relation to bone disease; connective tissue biology and pathogenic mechanism in arthritis; and basic and clinical aspects of cancer research.

Topics available include the following:—

1. The development of biochemical methods of monitoring clinical disorders of bone and joint metabolism.
2. The origin, regulation and function of human bone cells *in vitro*, and the mode of action of steroid hormones and drugs on osteoblasts and osteoclasts.
3. Interactions between intracellular signalling systems (phosphoinositides, calcium and cyclic nucleotides) and the investigation of novel lipid mediators.
4. Studies on the role of neuroendocrine and paracrine agents (especially kinins and angiotensin) in the control of pituitary hormone secretion.
5. Studies on the genetic control and mechanisms of action of cytokines (e.g. interleukin 1, tumour necrosis factors, interferons and transforming growth factors) in human disease processes.

Applicants should possess a good honours degree in a relevant science subject. Candidates with previous work experience are particularly welcome to apply.

Applications should include a curriculum vitae and the names of two academic referees. Please apply to **Professor R. G. G. Russell, or Professor B. L. Brown, Department of Human Metabolism & Clinical Biochemistry, Beech Hill Road, Sheffield, S10 2RX (tel: 0742-766222, ext. 3037)** as soon as possible. (8405)F

KING'S COLLEGE LONDON
University of London
DIVISION OF BIOMEDICAL SERVICES
Anatomy and Human Biology

The Biological Sciences Committee of SERC has awarded an earmarked research studentship in support of a study into the regulation of cell adhesion and spreading. The project will investigate the role of oligosaccharide residues as modulators of the adhesion, and subsequent spreading, of cultured human cells onto purified glycoproteins of the extracellular matrix. The work will involve a wide range of techniques including protein purification and isolation of glycosylated and deglycosylated fragments, the use of monoclonal antibodies and synthetic peptide sequences which interfere with the adhesion mechanism, cell culture and cell adhesion assays, and computer-aided image capture and analysis techniques.

Final year students who expect to obtain a first class or upper second class honours degree in cell biology, biochemistry or a related discipline this summer are invited to contact: **Dr Gareth Jones, Anatomy and Human Biology, King's College London, Strand, London WC2R 2LS.** (8396)F

Cancer Research Campaign Laboratories
Immunology/Drug-Targeting Research Group
University of Nottingham NG7 2RD

POSTGRADUATE STUDENTSHIPS

Ph.D studentships are available commencing October, 1989 to participate in the departments research programme into immunological responses in cancer, including the use of anti-idiotypic antibodies (contact Dr. R.A. Robins) and tumour antigen biochemistry and structural studies relating to research on the development of monoclonal antibodies for drug targeting (contact Dr. M.R. Price).

Candidates must hold or expect to gain at least an upper second class honours degree. Further details may be obtained from the appropriate supervisor. Applications to be sent to the Secretary including two academic referees by April, 1989. (8391)F

AUSTRALIA

Australian Research Council

QUEEN ELIZABETH II FELLOWSHIPS

The Australian Government has established the Queen Elizabeth II Fellowships to encourage research by young scientists of exceptional promise and proven capacity for original work. Under this Scheme, 15 awards will be made annually. Fellowships may be taken up in industry, universities, colleges of advanced education or government research organisations in Australia and are normally for three years. Tenure of the Fellowships expected to commence within nine months of the announcement of the award.

Qualifications

Fellowships will be awarded to persons holding a PhD or equivalent qualifications, or equivalent research or professional experience. The decisions regarding equivalent qualifications will be made on a case by case basis. Recommendations for the award of Fellowships will be made to the Minister for Employment, Education and Training by the Australian Research Council. Fellowships will in general be restricted to applicants who are not more than 30 years of age when applications close, but consideration will be given to older people with less than five years post doctoral experience who have had an interrupted or late start to their academic career.

Eligibility

Fellowships will be awarded on merit to suitably qualified persons.

Salary

$31,143 (Australian) per annum increased to $33 738 per annum at age 28 years.

Travel Expenses

Necessary travel expenses are payable.

Research Support Grants

An additional supporting grant of up to $3 000 per annum to help cover research costs is available.

Applications

Persons interested in applying for the above Fellowships should obtain application forms and a statement of the Conditions of award from:

Director
Research Fellowships
Research Policy and Grants Branch
Department of Employment Education and Training
GPO Box 9880
CANBERRA ACT 2601 Australia

The next round of fellowships will be announced in October 1989. Applications received after the closing date of 14 April 1989 will not be considered.

(WF8876)E

Glaxo's Growth Is Your Opportunity

Glaxo Inc. is not only one of the Top 5 ethical pharmaceutical firms in America, we're also the fastest growing research-oriented company in the country. As part of our continuing growth, Glaxo is expanding its research facilities in Research Triangle Park, North Carolina to one million square feet, under the direction of Dr. Pedro Cuatrecasas. This has created opportunities for

POSTDOCTORAL FELLOWSHIPS

These positions, for a period of one to three years, will be available for highly qualified individuals with enthusiasm for discovery through basic research in the biological sciences. Publication of basic research findings is encouraged, as is participation in scientific meetings. Opportunities are available in the following areas:

- **modulation of ion channels using patch clamp technology**
- **regulation of fatty acid metabolism in inflammation**
- **role of free radicals in disease**
- **modulation of cell — cell interactions**
- **endothelial cell biology**
- **tumor progression and metastasis**
- **regulation of metabolism in diabetes and obesity**
- **in vivo cardiovascular pharmacology**

At Glaxo Inc. growth opportunities and state-of-the-art facilities are complemented by a location (Raleigh-Durham-Chapel Hill) that has excellent universities in close proximity. Further, we reward talent and creativity with an excellent salary and benefits package. Candidates interested in these positions, please send curriculum vitae, along with the names of three references, to:

PHARMACEUTICAL SCIENCES INSTITUTE

DEPARTMENT OF PHARMACEUTICAL SCIENCES

Three Research Fellowships are available to support work in the Drug Development Group and the Cancer Research Campaign (CRC) Experimental Chemotherapy Group.

1. Postdoctoral Fellowship in Synthetic Chemistry (MRC AIDS Directed Programme)
Ref: 892/6

This three-year post will involve the design and synthesis of novel anti-viral agents specifically modified to facilitate their transport to the brain. The person appointed will be an organic or pharmaceutical chemist with an appreciation of the nature of the biological challenge of AIDS. The successful candidate will join a lively team employing modern techniques in the rational design of novel chemotherapeutic agents.

2. Postdoctoral Fellowship in Synthetic Chemistry (CRC Funded)
Ref: 894/6

The CRC Group seeks to appoint a chemist, preferably with experience in either stereo-controlled synthesis or modified peptide synthesis. The Fellow will join a large team of biologists, chemists and pharmacists with resources to develop novel agents from the chemistry bench through to clinical trial.

3. Postdoctoral Fellowship in Cell Biology (CRC Funded)
Ref: 893/6

The successful applicant will work on the growth and differentiation of murine colonic carcinomas in vitro. Cell lines have been established with variable degrees of differentation; the project seeks to investigate the effect of extracellular matrix components on the growth and differentation of these lines and to establish their chemosensitivity.

Commencing salaries will be within the range £9,865 to £15,720 per annum.

Application forms and further particulars may be obtained from the Personnel Officer (Academic Staff), quoting appropriate reference number, Aston University, Aston Triangle, Birmingham B4 7ET. Tel: 021 359 0870 (24 hour answer-phone).

Closing date for the receipt of applications is 10th March, 1989.

ASTON UNIVERSITY

THE ROYAL SOCIETY OF EDINBURGH

PERSONAL RESEARCH FELLOWSHIPS

The Royal Society of Edinburgh invites applications for a limited number of Personal Research Fellowships, tenable from 1 October 1989, to be held in Scottish Universities, Central Institutions, Colleges, Research Institutes and Industrial Laboratories.

Fellowships, which may be in any discipline, are held for up to three years and salaries will be on University Research grades 1A and 2 (in the range £12,150-£16,975). Applicants should normally be aged under 32, must possess a doctorate or equivalent higher qualification and must be able to demonstrate an outstanding ability for independent research.

Further details and application forms are available from the **Executive Secretary, The Royal Society of Edinburgh, 22-24 George Street, Edinburgh EH2 2PQ**, and must be returned by 31st March 1989. (8407)E

MEDICAL RESEARCH COUNCIL

NATIONAL INSTITUTE FOR MEDICAL RESEARCH

Two Postdoctoral Fellowships

are available in molecular neurobiology, to join a multidisciplinary approach to the problem of neural regeneration in mammalian CNS (laboratories of Dr Frank Grosveld, Dr Roger Morris, Dr Geoff Raisman and Dr John Seely). A strong background in protein chemistry is preferred for one position, and in molecular biology/neurobiologoy for the second.

Positions are funded for 3 years by the International Spinal Research Trust, salary is according to MRC scales range £12,520–£15,950 inclusive of London Weighting per annum depending on experience.

Applications, including a curriculum vitae, and names of two professional referees, should be sent to **Mr C R Russell, Administrative Manager, NIMR, The Ridgeway, Mill Hill, London NW7 1AA**, quoting job reference: ISRT5/PNB. Closing date for this post will be 10th March 1989.

An Equal Opportunities Employer. (8430)E

MRC Medical Research Council

nature the widest international selection of jobs in science — EVERY WEEK

The Royal Society of Edinburgh

CASS Travelling Fellowships

The Royal Society of Edinburgh is pleased to be able to offer two new Travelling Fellowships in 1989 and invites commercial or industrial organisations in Scotland to nominate an employee whom they consider suitable for these prestigious Fellowships.

The Fellowships are intended to support travel abroad, for a period of normally up to three months, to study overseas research or commercial practices which would be of benefit to Scotland. Each Fellowship will be worth up to £5000, in addition to any contribution from the Fellow's employer. A requirement of these Fellowships is to produce a report, which will be published by the Society.

Nomination forms and further details can be obtained from the **Executive Secretary, Royal Society of Edinburgh, 22-24 George Street, Edinburgh EH2 2PQ** and must be returned by 28 April 1989. (8406)E

AWARDS

THE ROYAL SOCIETY OF EDINBURGH

AUBER BEQUEST FUND AWARDS

The Royal Society of Edinburgh invites applications for the Auber Bequest Fund Awards.

The Council of the Society is pleased to be able to offer to bona fide scholars and scientists assistance for the furtherance of academic research in any of its branches. To comply with the terms of the Auber Bequest applicants must:

1. be over sixty years of age
2. be naturalised British citizens or desire to acquire British nationality
3. reside in Scotland or England
4. be bona fide scholars engaged in academic research (but not industrial research)

The awards will normally be for a period of not more than twelve months and will not normally exceed £2,000. At the end of the period of the award, a report on the research carried out will be required and should be submitted to the Executive Secretary.

Application forms and further details are available from **The Executive Secretary, The Royal Society of Edinburgh, 22-24 George Street, Edinburgh EH2 2PQ.** Completed applications should be submitted to the Executive Secretary not later than 15 May 1989. (8408)N

Do you deserve a medal?

RSPB/Esso BIRDS AND COUNTRYSIDE AWARDS

More to the point, has someone you know done something for wild bird and countryside conservation? If so, the Royal Society for the Protection of Birds and Esso want to hear about it.

We are looking for individuals or organisations who have made an outstanding contribution to wild bird and countryside conservation in the following award categories:

INDIVIDUAL

For the person judged to have made the greatest contribution within the UK.

INDUSTRY

For the commercial body judged to have made the greatest collective contribution within the UK.

MEDIA

For the individual, publication or media organisation judged to have made the greatest contribution to the reporting of wild bird and countryside conservation issues.

EUROPEAN

For the individual or organisation judged to have made the greatest contribution in Europe, outside the UK.

GROUP

For the non-commercial, UK based body or authority judged to have made the greatest collective contribution within the UK.

ESSO AWARD

Top prize: £1,000

Two runners-up prizes: £500

This special award to be given to a young people's project (age range 9-16 years) judged by Esso to have made the greatest contribution to wild bird and countryside conservation, to give further support to their work.

Presentations will be made at a luncheon in London. Celebrities from the worlds of politics, industry, show business and conservation will be there to demonstrate their concern for our countryside. Will you?

For your RSPB/Esso Birds and Countryside Awards pack, telephone Margaret Gaylor on 0767 80551 or write to RSPB/Esso Birds and Countryside Awards, RSPB, The Lodge, Sandy, Beds SG19 2DL. Closing date for nominations is 31 March 1989.

AGRICULTURAL & FOOD RESEARCH COUNCIL

FUNDING FOR PLANT MOLECULAR BIOLOGY

The AFRC has announced a major research initiative in plant molecular biology. Expenditure will be £3.5m in 1989/90, £4.5m in 1990/91 and £6m in later years. Applications are now invited for support.

Approximately half the funds will support a coordinated programme, principally in universities and polytechnics, on the molecular biology of plant development. The remainder will support research in universities, polytechnics and AFRC institutes on any aspect of plant molecular biology.

The coordinated programme will focus on *Arabidopsis thaliana*. This brassica relative has been chosen as a model system because the relative simplicity of its genome will facilitate the isolation of genes which have important functions in crop plants. The work will aim to understand the physical and genetical make up of this plant so that it will have greater genetic utility. Elements of research that will be encouraged include,

Development of protoplast and tissue culture methods to improve DNA transfer methods and to provide means for screening and selecting mutants.

Development of vectors for complementation of mutant phenotypes and homologous recombination.

Development of transposon tagging systems for identifying interesting genes.

Classical genetic studies in order to isolate and characterize new developmental mutants of *Arabidopsis*.

In support of the coordinated programme a library of overlapping clones covering the whole genome of *Arabidopsis* will be developed and maintained at the AFRC Institute of Plant Science Research.

In addition to plant molecular biologists, applications are strongly encouraged from geneticists, biochemists and other biologists who have not previously worked with plants but who would be interested in doing so.

Complementing the coordinated programme on *Arabidopsis*, research will be supported on plant molecular biology. This may be in any relevant area but the Council has identified the following topics as ones which it is particularly concerned to support.

Regulation of metabolic pathways

Regulation of development of any suitable species

Regulation of reproductive processes

Signal perception and transduction

Genome organisation and chromosome structure

Development of gene isolation, assessment and transfer techniques

Incorporation of commercially important genes into crop plants

Release of genetically manipulated organisms into the environment

Applications are now invited from UK Universities and Polytechnics to participate in the coordinated programme or in the separate research topics. Grants will normally be for three years in the first instance, but with the possibility of renewal. Support may be given for research and technical staff, equipment and consumables; the Council envisages significant expenditure on equipment. Where appropriate, applicants are also encouraged to make cases for funds to enable named overseas research scientists to work in this area in the UK for a period, and *vice versa*.

Further information on the programme may be obtained from Dr Gareth Price on 0793 514242, ext 255.

Applications, 5 copies, should be made (by 31 March 1989) on standard AFRC research grant forms addressed to, **AFRC Plant Molecular Biology Programme, University Support Branch, AFRC Central Office, Wiltshire Court, Farnsby Street, Swindon, SN1 5AT.** Telephone requests for forms should be made on 0793 514242 ext 206.

Call for Abstracts

THIRD ANNUAL NORTH AMERICAN CYSTIC FIBROSIS CONFERENCE

Tarpon Springs (Tampa), Florida
October 11–14, 1989

A multidisciplinary conference for researchers, physicians, and allied health professionals on the latest advances in CF research and care.

Plenary Sessions: The CF Gene—Where We Stand • Advances in Medical Treatment of CF • A Look to the Future

Symposia: Clinical Application of DNA Technology • The CF Gene—Molecular and Biochemical Approaches • CF 101 • Diagnosis and Management of Liver Disease • Heart-Lung Transplantation • Nutrition and CF • Management of Lung Disease in the First Two Years of Life • Controversies in CF Care • Successful Strategies for Living with CF

Basic Science Seminars: Pseudomonas Colonization and Persistence • Electrolyte Transport–Mechanisms and Regulation in CF

Conference proceedings will be published as a supplement to *Pediatric Pulmonology.*

For abstract forms and registration materials, contact the

THE THIRD CAMBRIDGE MINI-SYMPOSIUM

(a series devoted to the exploration of the molecular and cellular aspects of drug actions).

JULY 7TH–8TH 1989
"RECEPTOR STRUCTURE AND FUNCTION"

Organised jointly by the Department of Pharmacology, University of Cambridge, the MRC Neurobiology Unit and the Parke-Davis Research Unit. To be held at Churchill College Cambridge.

In the 1989 Symposium we intend to explore the relationship between the structure and function of both membrane-bound and non membrane-bound proteins. The discussions are intended to range from X-ray and nmr data on receptor structure, enzyme and receptor-ligand interactions, through to functional responses involving, for example, linking to channels and regulatory proteins.

The audience and participants are intended to be multidisciplinary comprising of pharmacologists, biochemists and medicinal chemists.

Invited speakers include: T. Blundell (London), G. Wagner (Michigan), R. Schwyzer (Zurich), A. Fersht (Cambridge), J. Saunders (M.S.D.), P. Goodford (Oxford), P. Dean (Cambridge), A Walmsley (Leicester), C. Venter (Rockville), N. Unwin (Cambridge).

Attenadance is limited to invited participants selected from those applying as outlined below.

Poster Session. Posters are invited from participants. Please indicate your intention to present a poster and a suggested title with your application.

Registration details: The Registration Fee of £25 covers the meeting and accommodation at Churchill College on 7th July, lunches on 7th and 8th July, breakfast on 8th July and the Symposium Dinner on 8th July.

A limited number of students and post-doctoral workers within three years of qualification will be given free registration and accommodation. In exceptional circumstances, a travel bursary may be available. Applicants for these places and bursaries should enclose a letter of support from their Head of Department.

Please send applications by 21st April enclosing a cheque for £25 payable to Churchill College, Cambridge and a brief resume of your research interests to:

In-situ Hybridization : A Practical Course

11 – 15 September 1989

Course Leaders: Dr J. H. Pringle (Pathology) and Dr P. V. Senior (Anatomy).

The course covers the use of non-radioactive and radioactive in-situ hybridization for life science and clinical research. There will be an emphasis on practical "hands-on" experience in the following options:

1. The use of non-radioactive methods for the demonstration of cytomegalovirus using biotinylated and hapten labelled genomic DNA probes plus the use of biotinylated oligonucleotides to detect immunoglobulin mRNAs.
2. The use of radioactive probes to detect developmentally linked specific mRNAs for extracellular matrix proteins and insulin-like growth factors. This will include the use of ^{35}S labelled ^{SS} cRNA and ^{35}P labelled oligonucleotides.

Practical sessions will be designed to cover all aspects of the techniques and will extend over four working days. A comprehensive lecture programme, common to both practical options, will be provided in support of the laboratory sessions.

Fee £500 including full board and accommodation.

Closing date for applications: 12th June 1989.

Enquiries to: **Mrs Kate Penny**, tel (0533 522464), **Continuing Education Unit, University of Leicester, Leicester LE1 7RH, UK.** (8441)C

Immunology Update for Clinicians

A revision course for clinicians and scientists

10-19th May 1989

The course is divided into two parts: part A (days 1-3) provides an introduction to fundamental immunology, part B (days 4-8) is designed to bring participants up to date with current concepts and progress in this field and to relate these concepts to clinical problems. Students may attend either part, but the course is designed as a continuum. On receipt of the registration fee, all participants will be sent a booklet entitled "Basic Immunology" which is designed as a primer for the course.

Topics include:

Part A	*Part B*
Cells involved in the immune response	Receptors on lymphocytes
Cell surface molecules	Complement
Lymphocyte activation	Immune response to viruses
Monoclonal antibodies	Autoimmunity
The major histocompatibility complex	Transplantation
	Immunodeficiency

Speakers include:

Dr F Balkwill, Prof. J R Batchelor, Dr D Crawford, Dr J Lamb, Dr R I Lechler, Dr P Lydyard, Prof. A McMichael, Dr A J Pinching, Prof. J H Playfair, Dr A Rees, Dr M A Ritter, Prof. K Sikora, Dr J Weber, Dr A Webster

Course organisers Prof. J R Batchelor, Dr R I Lechler, Dr E R Kaminski, Dr M A Ritter

Course fee (inc. catering)
Part A: **£140** 3 days
Part B: **£235** 5 days
Parts A & B: **£365** 8 days

IUPAC STOCKHOLM 1989

32nd IUPAC Congress

Stockholm 2-7 August 1989

Organized by the Swedish National Committee for Chemistry
The Royal Swedish Academy of Sciences

The Organizers cordially invite you to attend the 32nd Congress of IUPAC, the International Union of Pure and Applied Chemistry, which will be held from Wednesday 2 to Monday 7 August, 1989, in Stockholm, Sweden.

SCIENTIFIC PROGRAMME

The Scientific programme is mainly devoted to seven areas of chemistry, comprising the Sections described below.

The scientific programme will include plenary lectures, invited lectures, oral contributions and posters.

More than one hundred prominent lecturers from all over the world have been invited.

Contributions to all sections are welcomed, as well as general ones.

Section I Large-Scale Separation of Biological Macromolecules, Cells and Particles
Section II Atmospheric and Marine Chemistry
Section III Chemical Communications and Chemical Interaction between Organisms
Section IV Solid State Chemistry — Frontiers in the Chemistry of Inorganic Materials
Section V Structure and Dynamics of Macromolecules
Section VI Electron Transfer Reactions
Section VII Chemistry and Biochemistry of Bile Acids

1ST INTERNATIONAL WORKSHOP ON THE MOLECULAR AND CELL BIOLOGY OF AUTOANTIBODIES AND AUTOIMMUNITY

July 27–July 29, 1989
at the Heidelberg Academy of Sciences
Heidelberg, Federal Republic of Germany

Organized by
E. K. F. Bautz, Heidelberg, **J. R. Kalden**, Erlangen, **M. Homma**, Tokyo, **E. M. Tan**, La Jolla

There will be five half-day sessions on

- **Clinical Autoimmunity**
- **Small Nuclear RNP's**
- **Synthetases, Polymerases and DNA-Binding Proteins**
- **Recombinant Autoantigens**
- **Cytoplasmic Antigens**

Each session will be introduced by a keynote speech followed by oral- and poster-presentations. The organizers invite submission of abstracts concerning recent work for oral or poster presentations. Attendance at the workshop is limited to 100 participants and is free of charge.

Applications for attendance and abstracts of one to two pages should be sent not later than April 30, 1989 to:

Prof. Dr. E. K. F. Bautz
Institute of Molecular Genetics
University of Heidelberg
Im Neuenheimer Feld 230
6900 Heidelberg/West Germany
Tel.: 6221-562677/Fax: 6221-562678

(W5872)V

NATO Advanced Research Workshop
REGULATION OF EXTRAVASCULAR FIBRINOLYSIS IN NERVOUS SYSTEM DEVELOPMENT AND DISEASE

July 2–8, 1989
Acquafredda d1 Maratea, Italy

Speakers include:

K. Dano (Copenhagen)
N. Beeds (Denver)
D. Monard (Basel)
H. Lijnen (Louven)
E. Levin (La Jolla)
D. Cunningham (Irvine)
J. Fenton (Albany)
R. Pittman (Philadelphia)
R. Tanzi (Boston)
J. Baker (San Francisco)
F. Blaai (Copenhagen)
R. Hill (Edinburgh)

The Workshop will consist of lectures, discussion and poster sessions. Attendance is limited and only by invitation. Several places have been reserved for participants other than speakers. Deadline for application and abstract (not exceeding 1 page) is April 13, 1989, please include FAX number, if any. Applicants will be notified by May 1, 1989. Cost for board and lodging is $500 (double occupancy). Limited NATO funds available for selected applicants from NATO countries. No registration fee.

Abstracts and letters of application with curriculum vitae to:

Dr. Barry W. Festoff (Workshop Director)
Neurobiology 151
VA Medical Center
4501 Linwood Boulevard
Kansas City, Missouri 64128 USA

Organizing Committee: Barry W. Festoff, Director (Kansas City, USA); Daniel Hantaï (Paris, France); Georgia Barlovatz-Meimon (Paris, France); Robin Carrell (Cambridge, U.K.); Gustave Moonen (Liege, Belgium).

(NW3319)V

COURSES & CONFERENCES

METHODS IN COMPUTATIONAL NEUROSCIENCE
August 6 – September 2, 1989

This intense, advanced lecture and laboratory course presents the basic techniques necessary to study single cells and neural networks using simulation software developed at the California Institute of Technology. Limited to 20 students. Co-Directors: James M. Bower and Christof Koch, California Institute of Technology. Applications deadline: May 15th, 1989

For further information and application forms, contact: **Admissions Coordinator, Marine Biological Laboratory, Woods Hole, MA 02543, Tel. (508) 548-3705, Ext. 216.**

EMBL

MOUSE MOLECULAR GENETICS

AUGUST 26 – 30, 1989
ORGANISED BY:

Erwin Wagner, IMP, Vienna
Peter Gruss, MPI, Göttingen
Richard Palmiter, HHMI, Seattle

This is the second in a series of annual meetings the first of which was held in 1988 at CSH, focusing on the molecular biology and molecular genetics of the mouse.

PROPOSED SESSIONS:

Embryonic Stem Cells
Cell Proliferation and Oncogenesis
Development of the Hemopoetic and Nervous Systems
Regulation of Gene Expression
Molecular Characterisation of Mutations
Molecular Genetics of Development
Molecular Approaches to Physiology
Models of Disease Processes

All prospective participants should submit abstracts within the context described above by **May 15 1989**
Abstracts will be selected for presentation as either talks or posters. There will be a small number of invited talks, as well as posters and short talks selected from abstracts. Graduate students and postdoctoral fellows are encouraged to apply

Registration, food and housing will be **DM 600.-**
Reduced graduate students rate **DM 400.-**
Requests for additional registration and/or abstract materials should be forwarded to Erwin Wagner, IMP, Dr. Bohr-Gasse 7, 1030 Vienna, Austria
Tel.: (222) 79 26 36-654, Fax: (222) 78 71 53

11TH INTERNATIONAL CONGRESS OF THE INTERNATIONAL SOCIETY OF DEVELOPMENTAL BIOLOGISTS 20TH-25TH AUGUST 1989

JAARBEURS CONGRESS BUILDING UTRECHT THE NETHERLANDS

YOUR OPPORTUNITY TO REVIEW ADVANCES IN THE FIELDS OF HUMAN, ANIMAL AND PLANT DEVELOPMENT

Developmental biology is a rapidly advancing science which enjoys increasing attention from a wide range of associated disciplines. The programme for this major scientific event will place emphasis on assessments in a wide variety of disciplines, including molecular biology, cell biology, biochemistry, embryology, genetics, immunology, botany, oncology and biotechnology. Plenary lectures, parallel symposia, poster contributions and special social events will combine to make the congress an international success.

Chairpersons		Symposia topics include:
R.G. Edwards	Cambridge	In vitro fertilisation and embryo transplantation
W.J. Gehring	Basel	Genetic control of pattern formation
Th. Graf	Heidelberg	Haemopoietic stem cell differentiation
F. Gros	Paris	Muscle development
J.B. Gurdon	Cambridge	Embryonic induction
J.K. Heath	Oxford	Growth factors and their receptors
M. Johnson	Cambridge	Cytoplasmic organisation and development
G. Klein	Stockholm	Developmental tumors
N. LeDouarin	Nogent-sur-Marne	Developmental neurobiology
A. McLaren	London	Germ cells
F. Melchers	Basel	Developmental immunology
H. Mohr	Freiburg	Developmental botany
G.B. Pierce	Denver	Teratocarcinoma and early mammalian development
J. Rossant	Toronto	Cell lineage in early embryogenesis
H.C. Schaller	Heidelberg	Pattern formation in invertebrates and lower eukaryotes
J. Sedat	San Francisco	Nuclear organisation and gene expression
A. Surani	Cambridge	Genomic imprinting and early development
J.P. Thiery	Paris	Extra-cellular matrix and cell adhesion molecules
M.Van Montagu	Ghent	Molecular development of plants
I.M. Verma	San Diego	Signal transduction and transcriptional regulation
E. Wagner	Heidelberg	Gene transfer into stem cells and embryos

International Exhibition: the publishers of *Nature* will be organising an associated international exhibition.

Poster sessions open to all participants: Deadline for abstracts 15th April 1989.

GRANTS AVAILABLE

The organising committee has a limited amount of grant money available for young scientists, under the age of 35, wishing to attend the meeting. Applications including a curriculum vitae and an abstract to be sent to:

ISDB Congress, c/o Hubrecht Laboratory,
Uppsalalaan 8, 3584 CT Utrecht,

Introducing Stratagene's New 1989 Catalog

Contains detailed information on the latest products and services for all your molecular biology needs.

Stratagene's 1989 Catalog Features:

- **Stratalinker™**: Crosslink DNA and RNA to nitrocellulose or nylon membranes in just 30 seconds.
- **ThermalBase™ Kit**: DNA sequencing using Taq Polymerase I. Successful sequencing through G-C rich regions.
- **Custom Libraries**: > 10^6 primary plaques in 2-3 weeks. Also available: large assortment of premade cDNA and genomic libraries prepared by Stratagene.
- **Zap™cDNA Synthesis Kit**: High efficiency Uni-directional Cloning.
- **VAGE™ System**: Southern and Northern gels and blotting in 3 hours instead of 30.
- **Lambda Zap™ II**: Lambda phage to pBluescript II without subcloning. Enhanced color selection.
- **Gigapack™ Gold**: Highest commercially available packaging extract. Greater than 2 x 10^9 plaques/ug.
- **Epicurean™ Coli**: High efficiency competent E. coli. (> 10^9/ug)
- **Restriction & Modifying Enzymes**: Very large selection.
- **Next Day Delivery**: Available on U.S. orders until 6PM EST.
- **Technical Support:** Provided by experienced scientists.

A NEW LAMININ HOMOLOGUE

FASEB SPECIAL ISSUE

We specialize in quality, custom peptide synthesis . . . so *you* don't have to!

HPLCs of unpurified, HF cleaved peptides

Our proprietary techniques enable MPS to supply you with all the custom peptides you need. For example, we can provide over 100 completely different 15-residue peptides in as little as three weeks. An analytical HPLC chromatogram is included with each peptide ordered.

MPS offers quality peptides with service we're sure you'll like. Call us with your questions or if you would like a complete price list.

MPS also provides a custom HF Cleavage Service and a unique HF Cleavage System.

COMPARE OUR PRICES

MPS is offering custom peptides at the extraordinary prices listed below.

10mer	$400
15mer	$550
20mer	$800

Prices are based on 50mg of HF Cleaved Peptide, 4 to 6 weeks delivery, minimum order of 3 peptides or $1000.

CAN YOU SYNTHESIZE PEPTIDES FOR LESS?

Before you buy an automated peptide synthesizer, you should consider the actual cost for in-house synthesis which includes the cost of reagents, personnel, service contracts, analysis, waste disposal, downtime and, of course, the initial cost of the synthesizer.

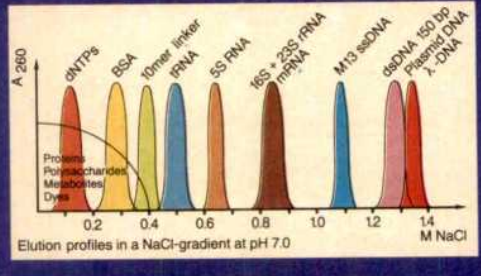
Preparing DNA?

QIAGEN



gle step purification

GEN disposables transform cumbersome nucleic acid preparations into an easy, saving and inexpensive job. Picogram to gram amounts of plasmid DNA, λ-DNA, mic DNA or RNA can be directly isolated purified from cleared cell lysates in one due to QIAGENs extended separation e (see fig.).

GEN-tips and -packs, which fit on conven- l pipettes or syringes, contain an anion- hange resin, patented to DIAGEN, for solid se extraction of nucleic acids. Expensive pment such as ultracentrifuges, HPLC/ C™ or reagents like CsCl and phenol are no er required.

high purity, excellent yields and superior gical activity of nucleic acids are routinely eved in 10 minutes:

Adsorb the lysate to QIAGEN.
Wash away impurities.
Elute the desired nucleic acid.

Elution profiles in a NaCl-gradient at pH 7.0

Biological activity

The quality of QIAGEN purified nucleic acids has been tested with more than 50 different restriction endonucleases, several polymerases, DNA ligases, phosphatases, kinases, and reverse transcriptases. Outstanding efficiency was obtained in all cases.

tips

QIAGEN-tip 5 and QIAGEN-tip 20 are prepacked pipette tips, with a capacity of 5 and 20 µg of nucleic acids respectively, which fit on variable volume pipettes. The entire procedure is performed simply by pipetting the appropriate solution in and out.

packs

QIAGEN-pack 100 and QIAGEN-pack 500 are small cartridges which fit on disposable syringes. The binding capacities are 100 and 500 µg of nucleic acids respectively.

tubes

QIAGEN-tube 20 is an Eppendorf™ tube containing resin sufficient to adsorb 20 µg of high molecular weight genomic DNA (50-200 kb) in a simple and gentle batch procedure.

For free samples and application protocols contact DIAGEN.

DIAGEN

THE NUMBER 1 REASON TO CHOOSE THE ACUGEN™ PERSONAL DNA SEQUENCER™

#1. EASY TO USE:

Forget autoradiography. Forget reading autoradiograms. Sensitive beta detectors gather data from the gel as it's running and convert that data to DNA sequence. And the gel system is fast, accurate, and easier than any you've ever used.

#1. AFFORDABLE:

The Acugen 402 costs less than half as much as other sequencers. So even if you're a small lab, you can afford it. And if you're a larger lab, you'll probably want to keep several running. The Acugen 402 is a personal sequencer—at a personal price.

#1. ^{32}P DETECTION:

The Acugen 402 builds on success—the success of reliable, inexpensive ^{32}P reagents and standardized, widely used protocols. There are no new complicated techniques to master. All you'll have to get used to, is how fast you can generate DNA sequencing data.

#1. COMPACT:

The Acugen 402 takes up remarkably little bench space—about as much as a manual sequencing apparatus. Yet it brings you all the power of DNA sequencing automation. Big features. Small size. The Acugen 402 is the ultimate combination.

For more information or a complete in-lab demonstration of the Acugen 402 personal sequencer, call us at 1-508-650-1180. We'll show you why we're one up on every other sequencer.

AT FASEB 1989

Introducing MultiLab, a flexible protein purification system which you control with the touch of a finger.

All you have to do is specify the method using the touch sensitive screen and MultiLab's expert software will monitor and control all the parameters for you.

MultiLab has been designed for...

- methods development
- protein purification
- monoclonal antibody purification
- evaluating column materials

MultiLab runs at low and medium pressures, enabling you to develop methods with the same materials that you can use on a larger

MultiLab's safety features include air sensors to detect the absence of buffers and an air eliminator to protect the column, so you don't have to be present while MultiLab gets on with the job.

For more information on how MultiLab can make protein purification easier for you call OROS now.

S-laminin, like its homologue laminin, is found in basement membranes but with more limited distribution, including neuromuscular junctions (see page 229). The cover shows an immunostained section of kidney with s-laminin (green) in the glomeruli and laminin (red) in both tubules and glomeruli.

THIS WEEK

Radiation risks

Reassessment of the exposure of the British public to indoor radon gas shows radon to be an even greater hazard than previously thought; on average, people are exposed to over 1,000 times the radiation dose from radon than from radioactive effluent discharges. Commentary, page 197.

Uncertain origins

Gerald Joyce reviews the evidence that at an early stage in evolution life was based on RNA. Although the evidence is compelling, understanding how an 'RNA world' could have come about poses many problems. Page 217.

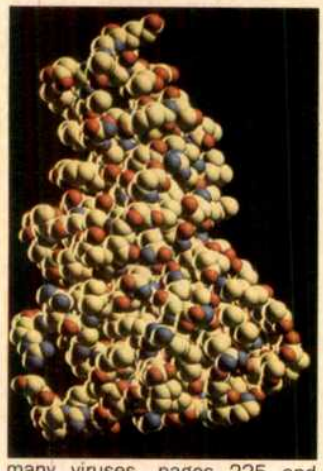
Celestial mechanics

A numerical integration extending backwards over 200 million years suggests that the motion of the Solar System is chaotic and that the predictability of planetary orbits, including the Earth's, would be lost within a few tens of millions of years, pages 237 and 207. And a clay tablet, found in 1948 among the ruins of ancient Ugarit, in what is now Syria, may be a record of an eclipse that occurred on 5 March 1223 BC, 152 years earlier than previously thought, with important implications. Pages 238 and 204.

Dunnock behaviour

DNA fingerprinting has been applied to the hedge sparrow *Prunella modularis*, a small passerine bird with a variable mating system, to relate parental care and mating system to paternity, pages 249 and 203.

Anionic doping



The first high-temperature superconductor formed by anionic rather than cationic substitution is reported on page 240.

New pulsar not alone

The discovery a few weeks ago of a submillisecond pulsar in supernova 1987A has turned theory on its head. The apparent 8-hour periodicity, on top of the 2,000-Hz pulsation rate, may indicate a Jupiter-mass companion in a one-million-kilometre orbit, or may be due to some instability in the neutron star itself. Page 234.

'Jelly-roll' protein

The crystal structure of the cytokine tumour necrosis factor (TNF) shows it to be a trimer of subunits with the 'jelly roll' fold characteristic of the coat proteins of

many viruses, pages 225 and 205.

FASEB Special Issue

Papers of particular interest to delegates at the New Orleans meeting of the Federation of American Societies for Experimental Biology include: AIDS in San Francisco (p.251); transgenic rice (p.274); generation of antibodies with specific catalytic properties (p.269, p.206); oestrogen receptors (p.271) and genetic footprinting (p.277). On page 278, news of exhibits at the FASEB exposition.

Nature® (ISSN 0028-0836) is published weekly on Thursday, except the last week in December, by Macmillan Magazines Ltd (4 Little Essex Street, London WC2R 3LF). Annual subscription for USA and Canada US$275 (institutional/corporate), US$125 (individual making personal payment). USA and Canadian orders to: *Nature*, Subscription Dept, PO Box 1733, Riverton, NJ 08077-7333, USA. Other orders to *Nature*, Brunel Road, Basingstoke, Hants RG21 2XS, UK. Second class postage paid at New York, NY 10012 and additional mailing offices. Authorization to photocopy material for internal or personal use, or internal or personal use of specific clients, is granted by *Nature* to libraries and others registered with the Copyright Clearance Center (CCC) Transactional Reporting Service, provided the base fee of $1.00 a copy plus $0.10 a page is paid direct to CCC, 21 Congress Street, Salem, MA 01970, USA. Identification code for *Nature*: 0028-0836/89 $1.00 + $0.10. US Postmaster send address changes to: *Nature*, 65 Bleecker Street, New York, NY 10012. Published in Japan by Nature Japan K.K., Shin-Mitsuke Bldg, 36 Ichigaya Tamachi, Shinjuku-ku, Tokyo 162, Japan.

"There must be an easier way to synthesize DNA!"

You said it yourself.

We call it Gene Assembler® Plus.

To begin with, Gene Assembler Plus is truly easy to get to know. All operations are controlled with the help of an IBM computer and incredibly easy software. Furthermore, with Gene Assembler Plus there's no need to prepare reagents or mix solvents. They're all prepacked and ready to use.

During operation, you can rest assured that success is ahead. A built-in monitor automatically registers the trityl concentration of each synthesis cycle. Coupling efficiency and yield are calculated for each cycle and results a displayed on the screen of your personal computer or printed out. If results differ from preset parameters, synthesis is automatically pu on hold. This way you ensure a successful oligonucleotide synthesis without wasting expensive reagents or solvents.

Finally, we know that an easy-to-use synthesize isn't the only key to successful DNA synthesis. That's why Pharmacia LKB is committed to providing you with all the help you may need . . from synthesis to final purification.

Why don't you contact us today to find out more about how to make DNA synthesis easier

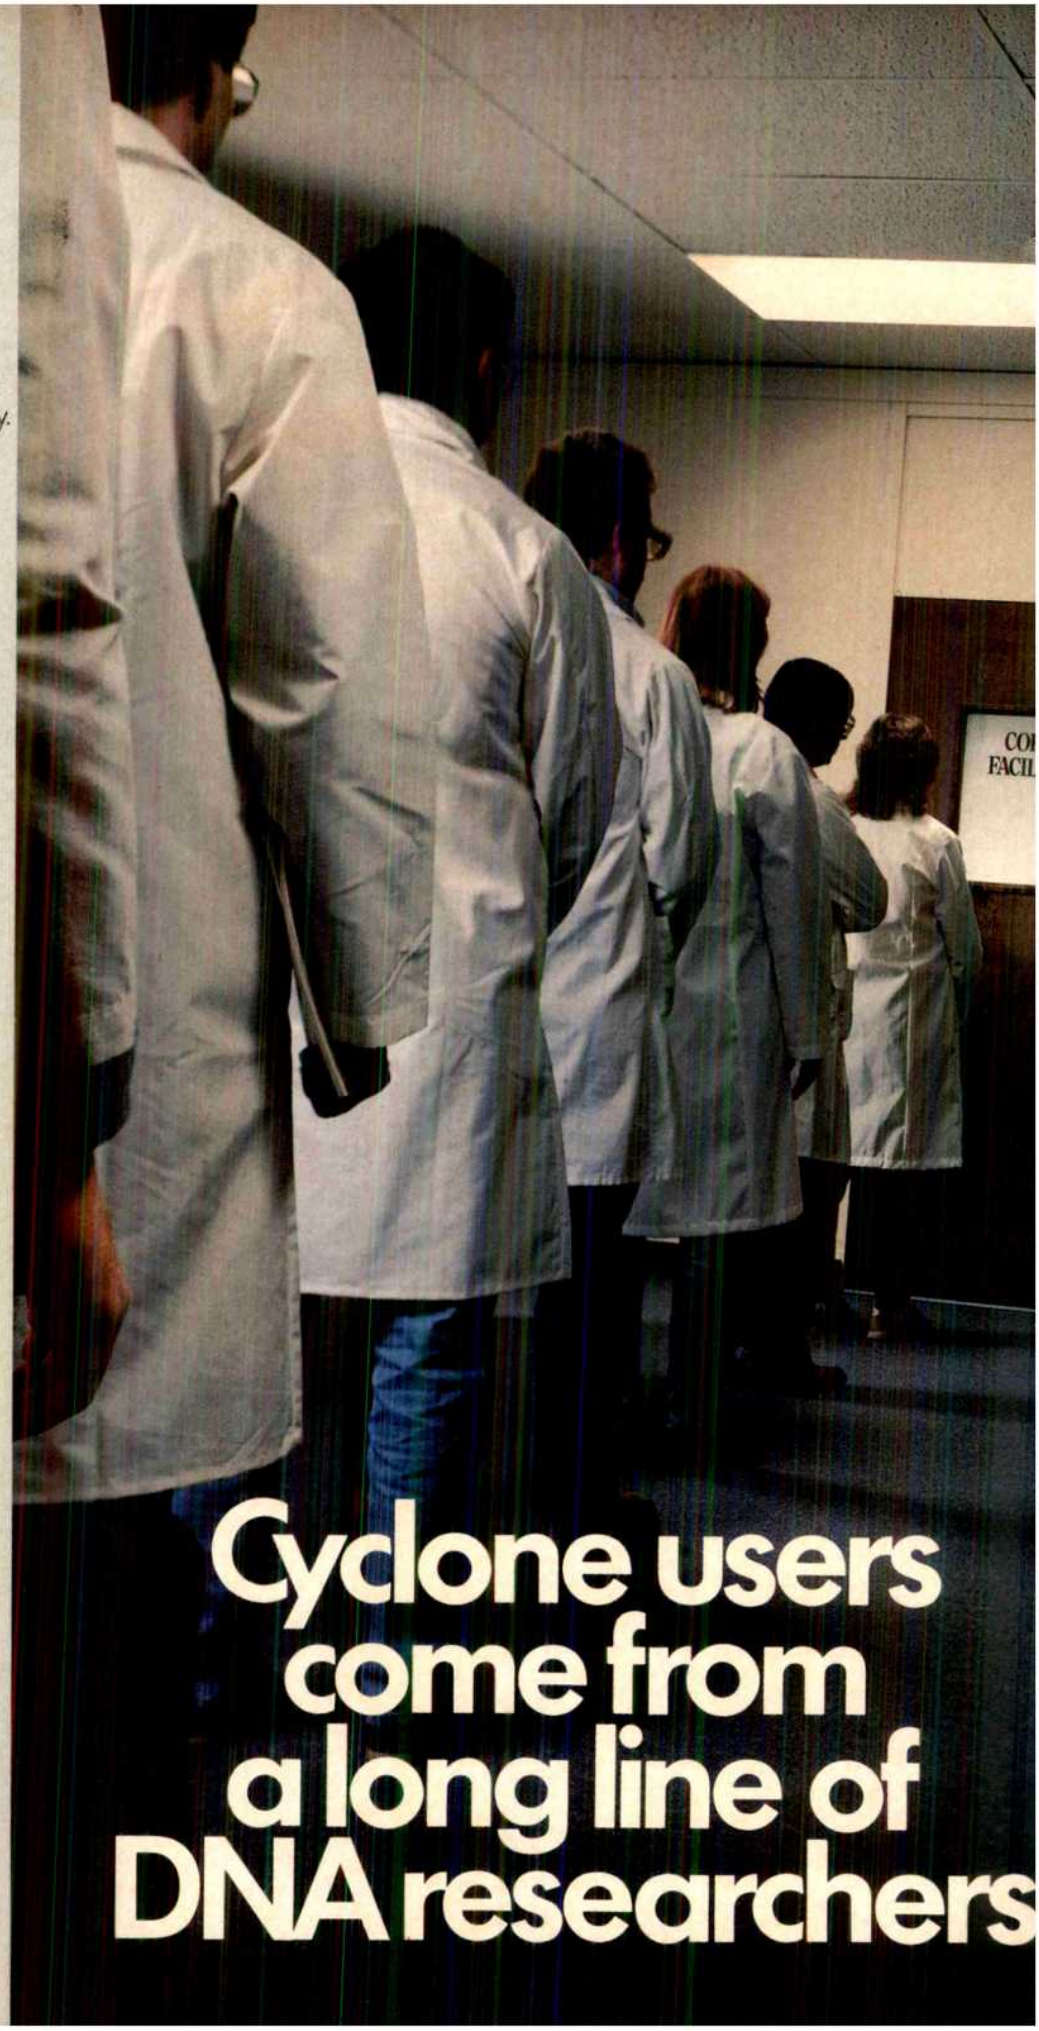
If your research can't wait for weeks while you wait for DNA, take a look at the Cyclone™ Plus DNA Synthesizer from MilliGen/Biosearch.

Convenient prepackaged chemistries and proven protocols allow you to produce probes, primers, even long (> 100-mer) fragments quickly and effortlessly.

Just load the reagents, key in your sequence, and press "Run." Cyclone Plus handles everything else—automatically.



In half the bench space, Cyclone Plus outperforms instruments costing twice as much.

Preprogrammed software cartridges make it easy to change protocols or synthesis scales. You can even create your own methods to customize a synthesis.

Cyclone Plus is available in either one-column or two-column configurations. And since it's priced within reach of any lab, there's no reason to wait another day. For more information, call 800-872-0071; in MA, 617-229-2870.

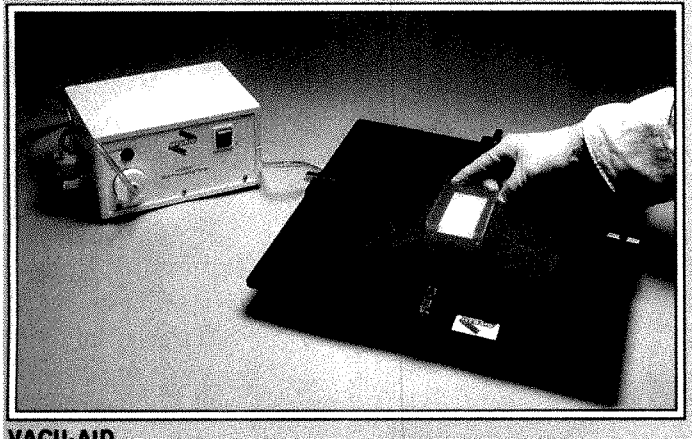
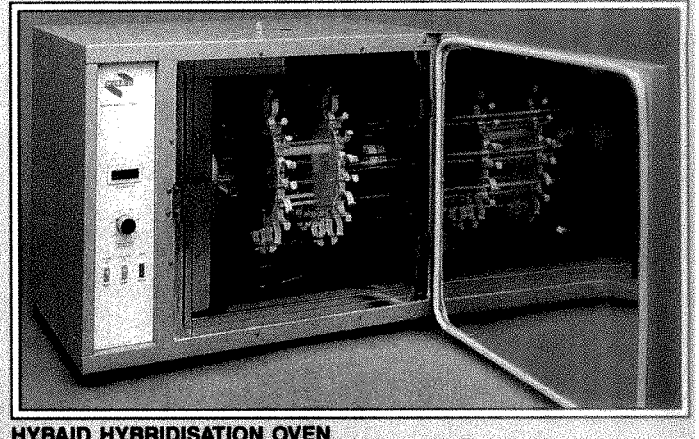
LOOK NO FURTHER
for the best in molecular biology equipment from HYBAID

NEW HYBRIDISATION O



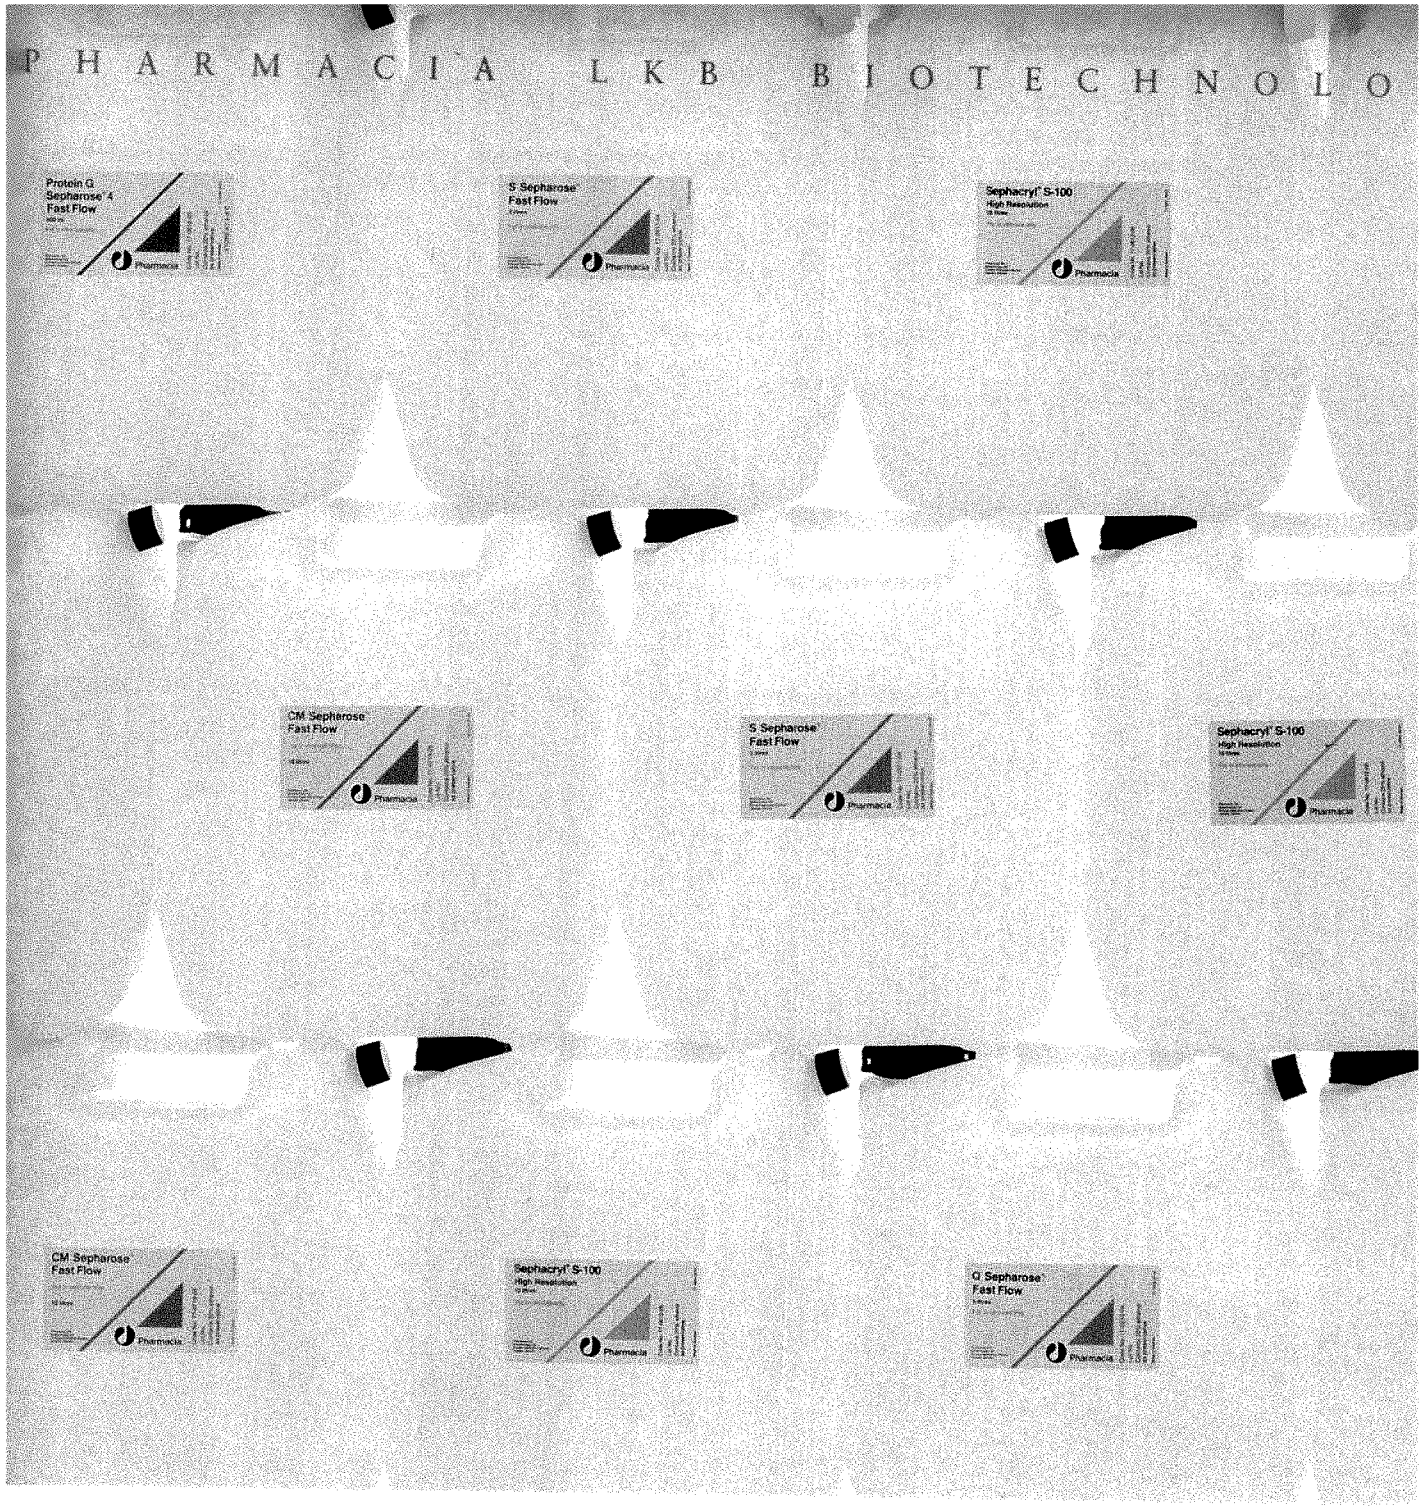
Hybaid Ltd is dedicated to designing products that automate various commonly performed molecular biology techniques.



HYBAID 100
Microprocessor controlled blot generation and processing system. Automates all post blot procedures such as prehybridisation, hybridisation and washing. Ideal for all types of nucleic acid blotting.

INTELLIGENT HEATING BLOCK
Programmable heating and cooling block for raising, lowering and cycling the temperature of 24 samples. Restriction digests, probe denaturation and other processes may be performed automatically.

VACU-AID
Fast and convenient generation of blots – at least 16 times faster than capillary blotting and dispenses with the need for piles of paper towels. Vacu-Aid can handle larger gels than any other commercially available system.



HYBAID HYBRIDISATION OVEN
For all types of blots including Westerns. Minimum probe volumes are needed and the oven provides exceptional temperature control. The unique rotisserie action ensures even probe distribution.

CONTACT US TODAY FOR MORE INFORMATION ABOUT THE LATEST DEVELOPMENTS FROM HYBAID. DISTRIBUTOR ENQUIRIES WELCOMED.

(Also available in lab packs).

Times change. Take Pharmacia sep aration media, for example. Not s many years ago, the large-sized pac was the exception rather than the rule. Today, the majority of gel filt ration, ion exchange, affinity and hydrophobic interaction media are sold to industry for the manufactu of products for human healthcare.

This change reflects industry confidence. Confidence in itself as

a reliable source of new pharmaceuticals. Confidence in Pharmacia as a secure supplier of separation media for production.

And because production cannot be anything less than safe, reliable and economic – and in complete compliance with strict regulatory requirements – nobody tests and compares separation media like the pharmaceutical and biotechnology industry. Nobody else monitors and records media performance over hundreds (often thousands) of production runs.

So industry knows and chooses the best. And industry chooses Pharmacia. Which means that whatever your application or scale of operation – whether you want to manage biomolecules or just process more product – a change to Pharmacia separation media is a change for the better. For everyone.

Ask for new media information and a selection guide.

EGF Reagents

Sigma is now offering purified growth factors and antibody reagents for use in receptor research.

Mouse Epidermal Growth Factor

Mouse Epidermal Growth Factor (EGF) is isolated from mouse submaxillary glands. The purity of mouse EGF is determined by amino acid analysis and analytical high performance liquid chromatography. Biological activity of purified EGF is evaluated using receptor binding and mitogenic assays.

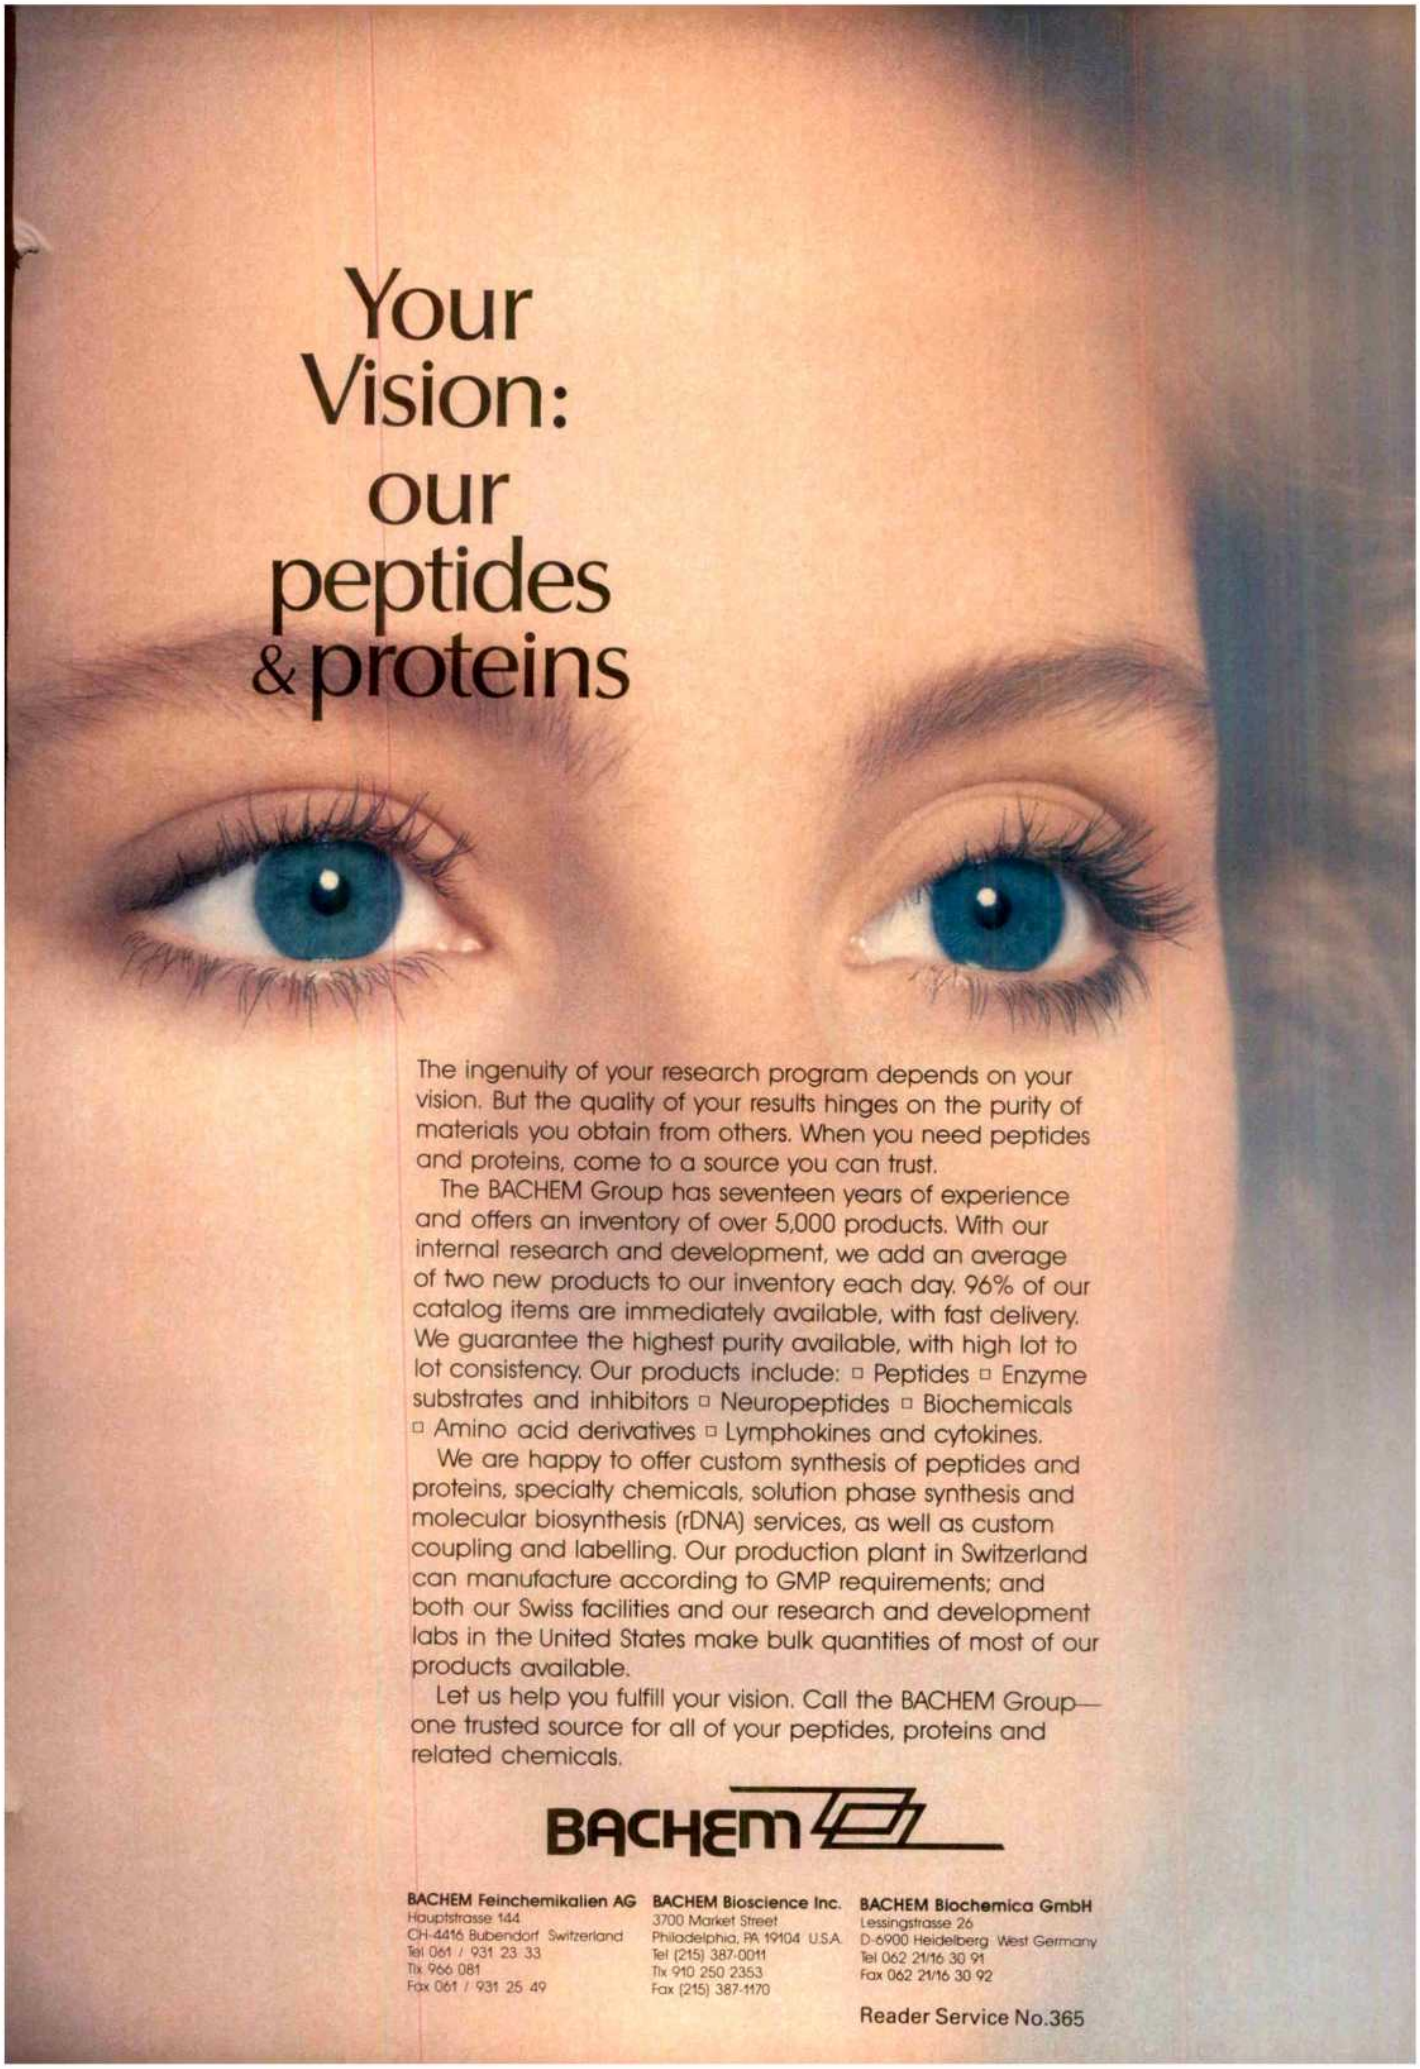
Anti-Mouse EGF

Anti-Mouse EGF is developed in rabbit using highly purified EGF from mouse submaxillary glands as immunogen. This antiserum may be used to monitor EGF levels in biological fluids, organs and cell culture media using RIA, ELISA or immunohistological methods.

Monoclonal Antibody to EGF Receptor

Monoclonal Anti-EGF Receptor (clone no. 29.1, Mouse IgG1) is produced from mice immunized with the A431 carcinoma cell line. Monoclonal anti-EGF receptor antibodies can be used for purification of the EGF receptor, structural and functional studies of the receptor molecule, and the investigation of cell transformation versus oncogenesis.

EGF reagents are among over 1000 qual immunochemicals developed and manufactured by Sigma. See the 1989 Sigma Immunochemicals Catalog for further det



Sigma warrants that its products perforn as described in Sigma literature.

Sigma Immuno Chemicals

The ingenuity of your research program depends on your vision. But the quality of your results hinges on the purity of materials you obtain from others. When you need peptides and proteins, come to a source you can trust.

The BACHEM Group has seventeen years of experience and offers an inventory of over 5,000 products. With our internal research and development, we add an average of two new products to our inventory each day. 96% of our catalog items are immediately available, with fast delivery. We guarantee the highest purity available, with high lot to lot consistency. Our products include: ▫ Peptides ▫ Enzyme substrates and inhibitors ▫ Neuropeptides ▫ Biochemicals ▫ Amino acid derivatives ▫ Lymphokines and cytokines.

We are happy to offer custom synthesis of peptides and proteins, specialty chemicals, solution phase synthesis and molecular biosynthesis (rDNA) services, as well as custom coupling and labelling. Our production plant in Switzerland can manufacture according to GMP requirements; and both our Swiss facilities and our research and development labs in the United States make bulk quantities of most of our products available.

Let us help you fulfill your vision. Call the BACHEM Group—one trusted source for all of your peptides, proteins and related chemicals.

Applied Biosystems has electrified DNA research.

We've electrified DNA research in more ways than one. As pioneers in developing innovative automated products for molecular biologists, we have the hands-on experience and technical expertise needed to deliver the high-powered instruments that have vitalized DNA research. You can choose leading-edge instruments for automatic extraction, sequencing, synthesis, and purification of DNA.

Unique DNA Extractor
Our one-of-a-kind, automated extractor has put an end to tedious, time-consuming manual procedures and virtually eliminated exposure to toxic chemicals. Now researchers can count on consistent, high-quality results. And, best of all, exciting new applications for the instrument are constantly being introduced.

New Standards in DNA Sequencing
We introduced the world's first automated fluorescent-based DNA sequencer. With our sequencer, researchers can now conceive of large sequencing projects previously impossible. Now you can interpret up to 8,000 bases per gel. Our new Taq polymerase reagent kit simplifies preparing extensions and delivers longer runs with improved accuracy over conventional sequencing chemistries.

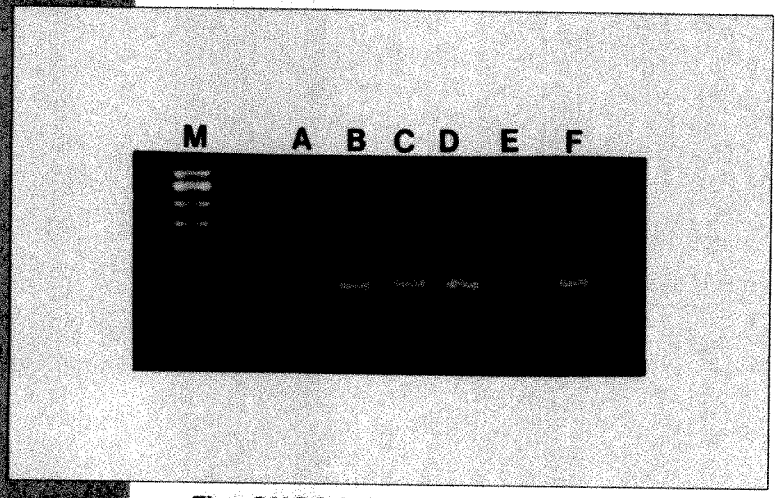
Most Popular DNA Synthesizers
Our reliable DNA synthesizers have earned a reputation for delivering quality synthetic DNA. Simple pushbutton procedures, streamlined operation, and dependable performance all combine to improve your research. Our reagent and amidite purity ensures biological activity of your sequence.



Proven Purification Systems
With our HPEC™ System, we've automated established electrophoresis technology to purify DNA. The system cuts sample handling steps and improves sample recovery over manual procedures. When you need rapid, convenient purification, use our OPC™ cartridge.

Applied Biosystems offers more high-powered instruments for molecular biologists than any other company in the field. For more information, call the office nearest you. We'd like to electrify your DNA research.

PCR Those Oncogenes!

CLONTECH offers the first easy alternative to tedious transfection assays for oncogene research screening. Our products incorporate the GeneAmp† Polymerase Chain Reaction (PCR) process for oncogene amplification, and are optimized for use with the Perkin-Elmer Cetus DNA Thermal Cycler.

The ONCO-LYZER™ Core Kit

Contains the new recombinant Perkin-Elmer Cetus AmpliTaq† DNA polymerase, buffers, dNTPs and control oncogene primers and template —in a package sufficient for 50 amplification reactions. Pair the ONCO-LYZER Core Kit with any of our . . .

PRI-Mate™ Matched Oncogene Primers

Primers are now available for amplifying regions containing codons 12, 13 and 61 of:

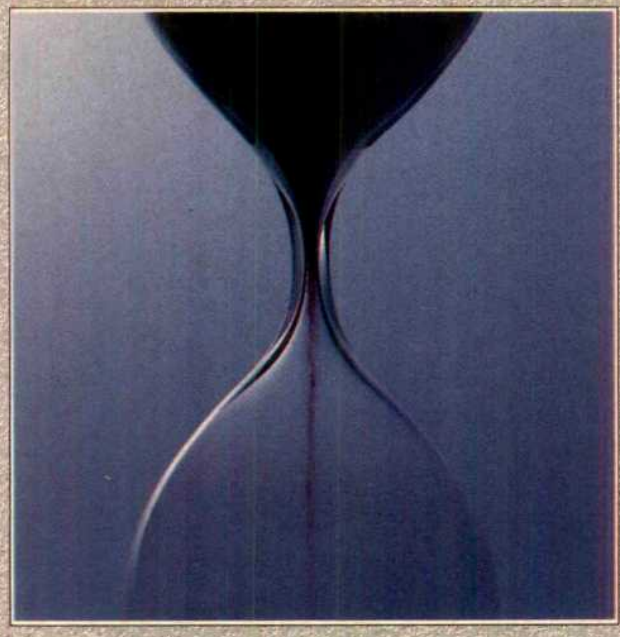
• Ha-*ras* • Ki-*ras* • N-*ras*

Each PRI-Mate set comes with instructions for optimized PCR conditions using the ONCO-LYZER Core Kit.

***ras* Oncogene Probes**

We offer MUTA-LYZER™ *ras* oncogene probe panels —the economical alternative to synthesizing the probes yourself. These probe panels can be used to differentiate all point mutations at codons 12, 13 and 61 in the three *ras* oncogenes. Detailed hybridization protocols are included.

All products are for research use only.



†PCR (Polymerase Chain Reaction) is covered by U.S. Patent No. 4,683,202 issued to Cetus Corporation, licensed by CLONTECH Laboratories Inc., for certain research applications only. Patents pending on *Taq* Polymerase and its use. Patents in Europe and Japan applied for. GeneAmp and AmpliTaq are trademarks of Cetus Corporation. ONCO-LYZER, PRI-Mate and MUTA-LYZER are trademarks of CLONTECH Laboratories, Inc.

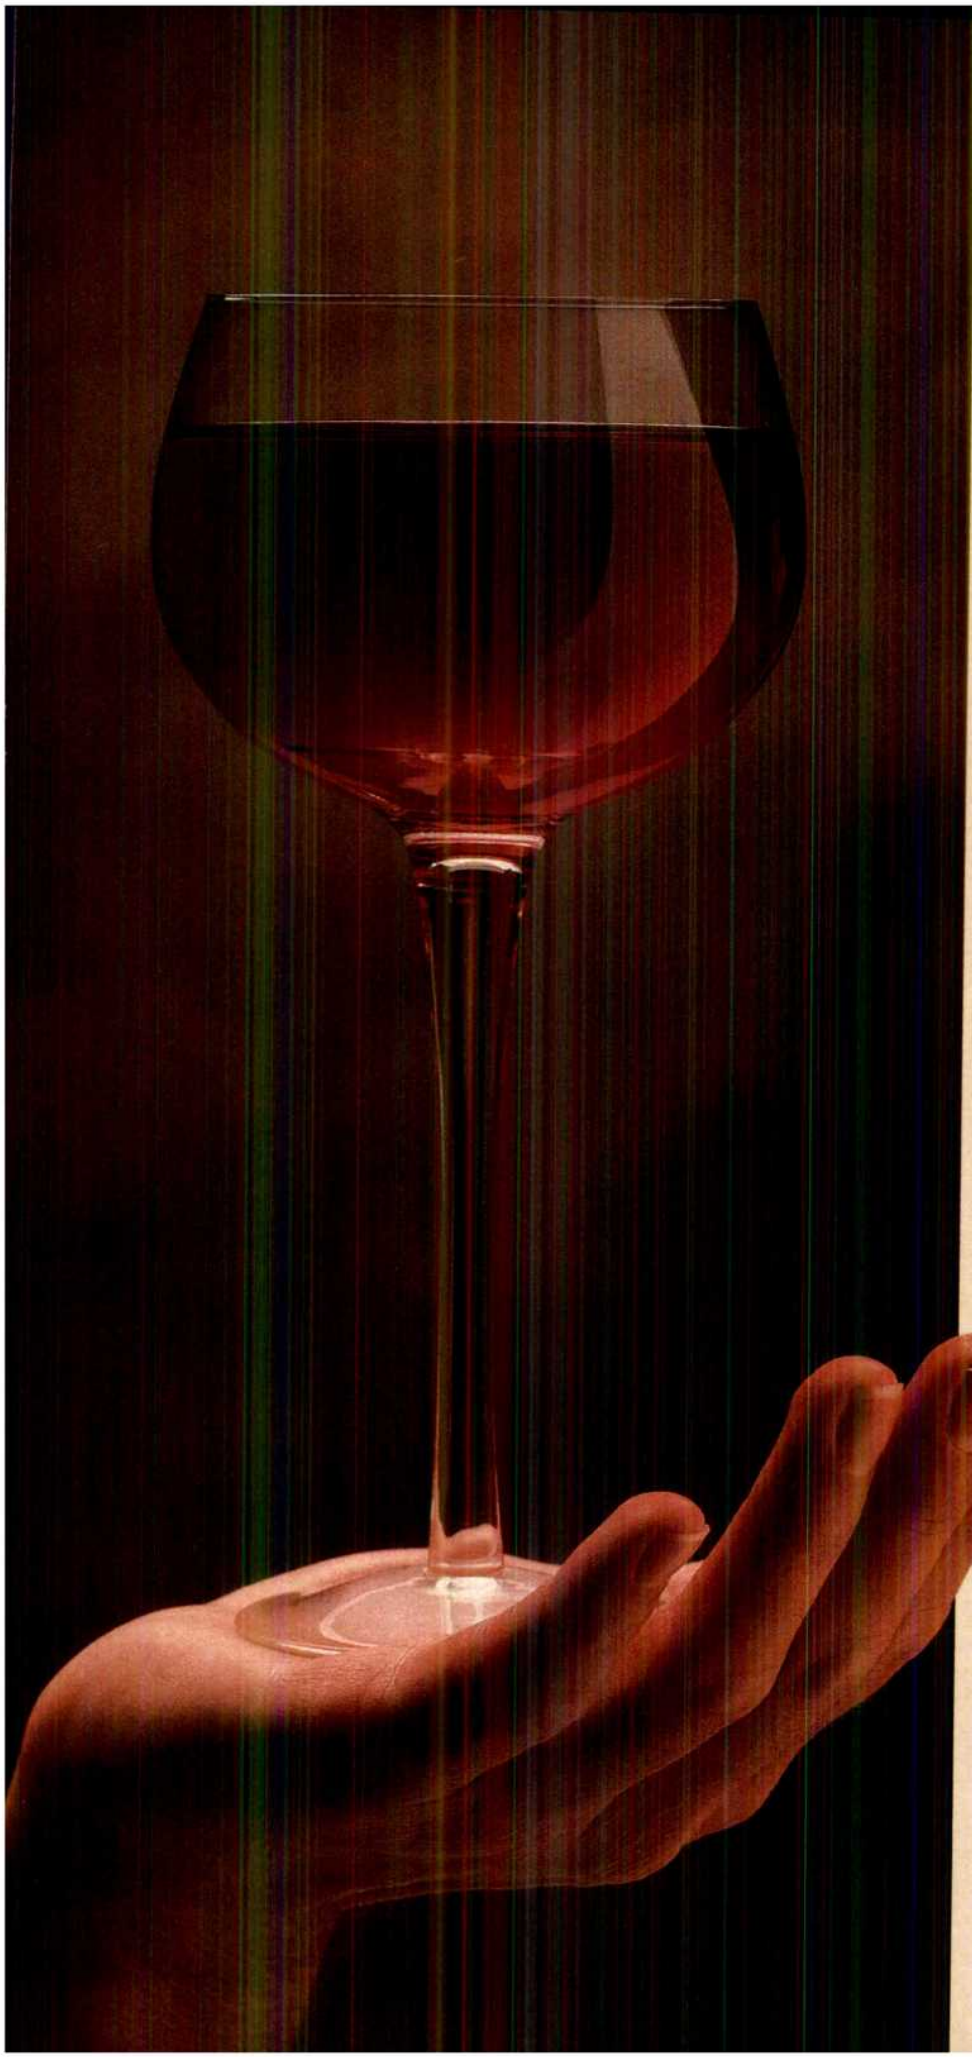
SCIENCE NEEDS SCIENCE

SINCE THE ADVENT OF THE HOURGLASS, SCIENTIFIC CREATIVITY HAS CONCENTRATED ON FINDING NEW WAYS OF SAVING TIME AND INCREASING RELIABILITY IN ALL FIELDS.

THE MOST RECENT SCIENTIFIC DISCOVERIES HAVE ALWAYS BEEN APPLIED TO DEVELOPING MORE ACCURATE AND RELIABLE RESEARCH TOOLS, WHICH IN TURN WILL PROMOTE SCIENTIFIC PROGRESS.

FOR OVER 30 YEARS, IN THE CONTINUING TRANSFER BETWEEN RESEARCH AND TECHNOLOGY BIO-RAD HAS BUILT ITS REPUTATON TROUGH:

o THE DESIGN, MANUFACTURE AND MARKETING OF INNOVATIVE SYSTEMS



o THE HIGH RELIABILITY OF ITS PRODUCTS ACKNOWLEDGED BY THE SCIENTIFIC COMMUNITY

BIO-RAD IS ACTIVE IN 6 MAJOR DISCIPLINES OF SCIENTIFIC AND MEDICAL RESEARCH:

◊ **FINE BIOCHEMICALS**
◊ **CHROMATOGRAPHY & ELECTROPHORESIS**
◊ **CLINICAL DIAGNOSTICS**
◊ **CONFOCAL LASER MICROSCOPY**
◊ **SEMICONDUCTOR MEASUREMENT SYSTEMS**
◊ **FOURIER TRANSFORM INFRARED SPECTROMETERS**

BIO-RAD

DABS brings stability to reversed phas amino acid analysis.

Stability. It's more than holding something steady for just a moment. It's *keeping* it that way. For a long, long time.

With DABS you won't measure derivative stability in minutes. Or even hours. DABS remains stable for weeks.

So you can do repeated runs from the same sample. Or go back days later and analyze a sample again using the same derivative, the same method — without changes.

And DABS only takes minutes to set up with our exclusive Dabsylation Kit.

Add the advantages of visible detection, and DABS is obviously the wise choice for high speed, high sensitivity amino acid analysis.

System Gold

And because you'll be using the world's easiest, most advanced HPLC — System Gold,™ the Personal™ Chromatograph — you'll have guaranteed methods and reference chromatograms available on disk.

To add stability to your reversed phase amino acid analyses, contact your local Beckman representative. Offices in major cities worldwide.

Call 800/742-2345 in the US. Or write Beckman Instruments, Inc., Altex Division, 2350 Camino Ramon, P.O. Box 5101, San Ramon, CA 94583.

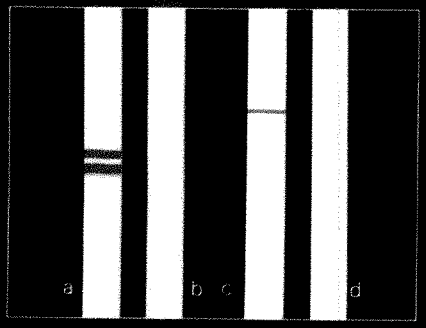
The unique ultra-small immunogold probe for increased labelling efficiency and penetration power

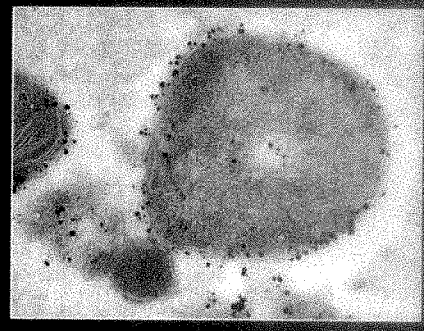
AuroProbe TRADEMARK One



WHY USE AN ULTRA-SMALL GOLD PROBE IN YOUR RESEARCH?

Janssen research developed the **AuroProbe One** technology around colloidal gold particles approximating 1 nm*.
AuroProbe One penetrates tissues and binds to target antigens with higher efficiency than conventional, larger immunogold probes.
That penetration power and labelling density improves immunodetection, whether you are immunostaining tissue or probing for antigen on blots. The **IntenSE**** silver enhancer, required for visualization, uses the relatively larger number of gold nuclei to yield a stronger signal.
Signal-to-noise ratios are markedly improved, and endogenous tissue reactions are absent. You won't need separate AuroProbe One reagents for microscopy and blotting applications as the ultra-small gold probe is an all-round marker system.
Order now! Witness the power and efficiency of AuroProbe One for your research.

* Patent pending ** Trademark



← *In situ* hybridization of cytomegalovirus (CMV)-infected adrenal gland using biotinylated entire CMV genome, rabbit anti-biotin, AuroProbe One and IntenSE.
(Volkers, van den Brink & Houthoff, Amsterdam)

Cryosectioned synaptosomes reacted with rabbit anti-B50, AuroProbe One and IntenSE.
(van Lookeren-Campagne & van Bergen en Henegouwen, Utrecht) →

← Blot of total extract of Hela cells and blot of partially purified nuclei of rat liver reacted respectively with rabbit anti-tubulin (a) and rabbit anti-actin (c) followed by AuroProbe One and IntenSE. Negative controls (b, d)

PtK$_2$ cells reacted with rabbit anti-tubulin, AuroProbe One and IntenSE →

pioneers in gold probe technology

70% mutants using phage or new phagemid* vectors

Now, there are *two* Muta-Gene™ *in vitro* mutagenesis kits. Both are based on a highly efficient and simple method of site-specific *in vitro* mutagenesis. This unique method[1,2,3] uses a simple, biological means of selecting against the original non-mutated template and results in highly efficient mutagenesis.

These kits offer you:

- **Versatility.** Clone into M13 vectors and use the **Muta-Gene M13 kit.** Or clone into pTZ phagemid vectors and use the **New Muta-Gene phagemid kit.** Gain the advantages of plasmids, such as cloning large inserts, and still obtain single-stranded DNA phages for mutagenesis and sequencing.
- **High mutation efficiency.** Greater than 70%.
- **Ease-of-use.** Only two enzymes are required. Pretested reagents and a detailed instruction manual insure success.
- **Rapid results.** Minimal manipulation means you get your mutants fast.
- **Controls.** Control DNAs, oligonucleotide primers, and phage or phagemid are included to test the system.
- **Economical.** The kits contain reagents for 25 reactions. Compare prices before you buy.

For more information, contact your Bio-Rad representative. In the U.S., call Bio-Rad's Molecular Biology Technical Services at 1-800-424-6783 and request Bulletin 1409. Or circle the reader service number.

*These phagemids were constructed from pUC18/19 by inserting the f1 origin of replication.[4] Under most circumstances, they replicate as plasmids. Super infection with a helper phage results in phage-like particles containing single-stranded phagemid DNA.

NIKON'S BRIGHT IDEA

he new MICROPHOT-FXA with oi-fluorescence attachement opens up new dimension in fluorescence nicroscopy.

Fluorescence microscopy is gaining wider attention and increased use anks to its high specificity and high sensitivity.

The Nikon MICROPHOT-FXA is ideal for this type of ork thanks to its Direct Projection System which enables ilization of 100% of the light from the specimen and equires astonishingly short exposure time. In addition, e newly designed extra-bright illumination system rther increases versatility by permitting photomicro- aphy of even the faintest fluorescence images.

If seeing is believing, then one look at the new ICROPHOT-FXA will convince you — it's the right choice.

AgBIOTECH '89 features a multi-track professional seminar program that only the editors of BIO/TECHNOLOGY could produce. And it's *all-ag*, all aspects — from lab to production to marketing to regulation.

Science/Technical

You'll hear leading researchers responsible for the most significant and splendid advances in transgenic crops and genetic engineering techniques discuss their research.

Business/Regulatory

You'll hear experienced industry executives with in-the-trenches experience discuss what has worked, what is economically viable, regulation, patenting, and future development.

If you're in ag-biotech — and determined to stay competitive in the '90's — you can't afford to miss this stimulating program! REGISTER TODAY!

A Faculty Of More Than 75 Ag-Biotech Experts Including:

Gordon Ada, Johns Hopkins University
***Charles Arntzen**, Texas A&M University
***Harvey Bialy**, Bio/Technology
Charles Baker, BioTechnica Agriculture
Andrew Barnes, Mycogen
Kenneth A. Barton, Agracetus
Jacques S. Beckmann, The Volcani Center
David Beier, Office of Congressman Robert Kastenmeier
Joseph Bouckaert, Advanced Genetic Sciences
***Fred Brown**, Wellcome Biotech
***G. Steven Burrill**, Arthur Young
***Edgar R. Butts**, E.R. Butts International
John Cantrell, RIBI Immunochem
***Jerry Caulder**, Mycogen
Joel I. Cohen, Agency for International Development
Luca Comai, Calgene
Abhaya Dandekar, University of California
Hugo Donner, Advanced Genetic Sciences
Adele Douglas, Humane Society
Jack Doyle, Environmental Policy Institute
Raymond Dull, Experience, Inc.
Christopher Earl, Plant Resources Venture Fund
***Gary B. Ellis**, U.S. Congress Office of Technology Assessment
JoAnn Fillatti, Calgene
Ray Fuchs, Monsanto Agricultural
Val Giddings, The World Bank
David J. Glass, BioTechnica Agriculture
Kathi Hanna, U.S. Congress Office of Technology Assessment
Tim Helentjaris, Native Plants
Maude Hinchee, Monsanto Agricultural
Curt Hutchinson, Wildlife International
Daniel D. Kahn, Institute National De La Recherche Agronomique
Robert D. Kahn, Robert D. Kahn & Co.
George H. Kidd, L. William Teweles & Co.
***Kelly Kincannon**, Kincannon & Reed
Christopher Lamb, Salk Institute
Richard Laster, DNA Plant Technology

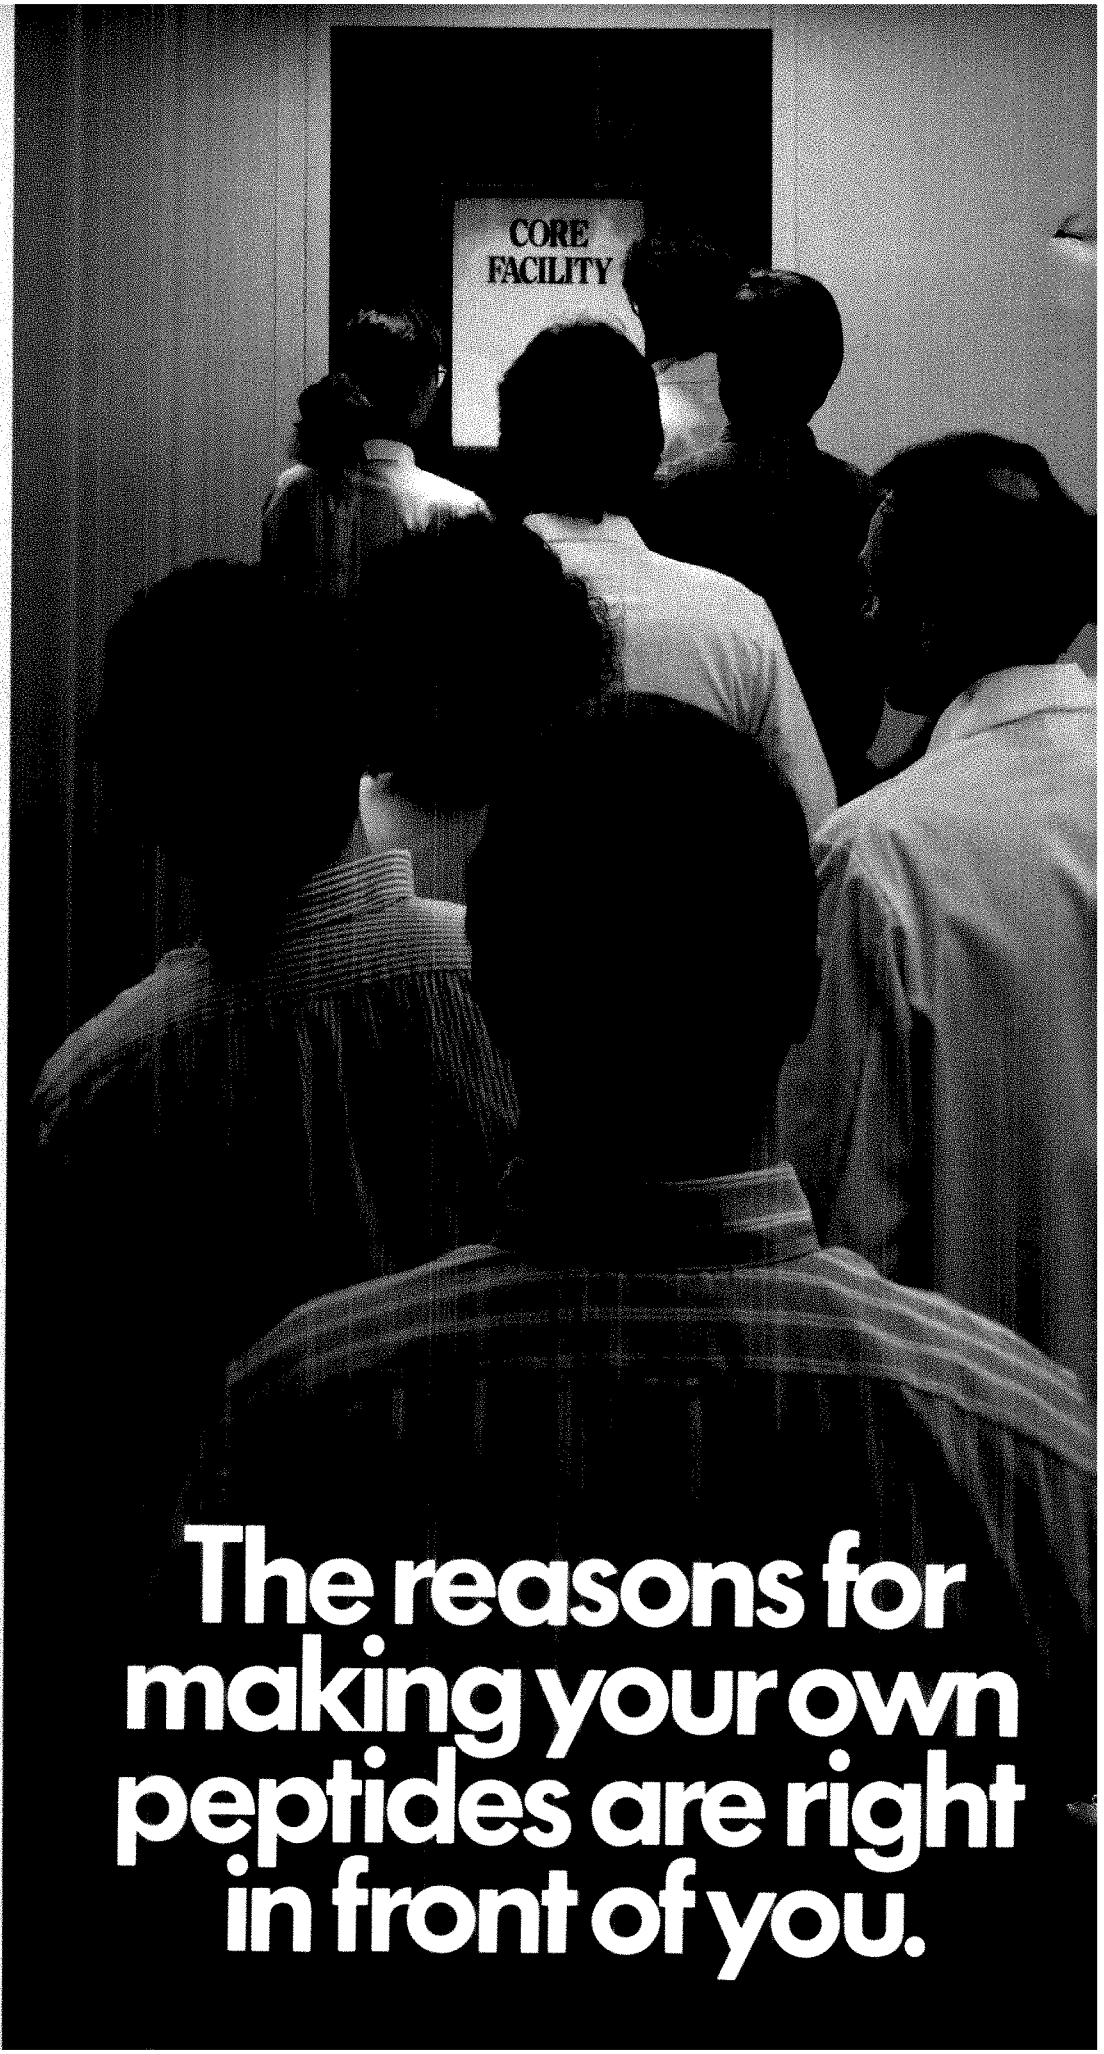
If your research can't wait for weeks while you wait for peptides, take a look at the new Excell™ Automated Peptide Synthesizer from MilliGen/Biosearch.

With the Excell system, you don't have to be an expert to synthesize high-quality, biologically active peptides. Simply enter your sequence, add prepackaged reagents, amino acid cartridges and reaction column, push "Start Synthesis," and walk away.



Using proven Fmoc/BOP + HOBt protocols (no HF), Excell achieves yields > 99% and cycle times < 1 hour.

Excell system Expert™ software recommends the best protocol for your sequence, automatically assigns coupling strategies, calculates reagent amounts, and verifies the sequence. Self-prompting menus guide you through each step, while a real-time synthesis report documents them.

And since it's priced within the reach of most facilities, there's no reason to wait another day. For more information call 800-872-0071; in MA, 617-229-2870.

Custom Peptides

Quality and Quantity to meet your needs

CRB is one of the world's leading suppliers of pure, custom designed peptides. Using Fmoc-polyamide solid-phase synthesis and our economical continuous flow column technology, we'll make the peptide you need. At the purity you require. In the quantity you need. On any scale from milligram to kilogram.

Custom Synthesis of Peptides
Three reagent qualities to provide maximum economy in your peptide application.

1 Standard Reagent Grade – supplied with hplc profile and amino acid analysis.
2 Immunological Reagent Grade – for antibody production. Purity minimum 80%. Supplied with hplc profile, amino acid analysis and FAB mass spectrometric analysis result.
3 Bioassay Reagent (bR) Grade – for biological studies. Supplied by net peptide weight at a guaranteed purity in excess of 95% with complete analytical specification.

Large Scale Peptide Production
To meet the growing demands of the Pharmaceutical Industry, we have developed a new process to manufacture bulk peptides under GMP conditions. This NEW 'Continuous Flow Column Process' offers a rapid and economic method for large scale production.

CRB also offers:

Custom Conjugation of Peptides to Carrier Proteins

Custom Synthesis of High Purity Tritiated Peptides

To discuss your application and requirement – Contact us now.

Islet-Activating Protein
—Pertussis Toxin—

Pertussis toxin potentiates any reponses of insulin-release from pancreatic islets of mammals and has various other activities such as:

- Promotion of lipolysis on adipocytes
- Inhibition of epinephrine-induced hyperglycemia
- ADP-ribosylation of cell-membrance protein
- Activation of adenylate cyclase
- Lymphocytosis-promoting activity
- Histamine-sensitizing activity
- Hemmagglutination activity
- Adjuvant activity

USB INTRODUCES SEQUENASE®* VERSION 2.0

A *NEW* ADVANCED PERFORMANCE ENZYME FOR DNA SEQUENCING

Artist's interpretation of *in vitro* genetic manipulation of the gene for T7 DNA polymerase to create Sequenase® Version 2.0.

Sequenase® Advantages:

- Low gel background
- Uniform band intensities
- Elimination of compressions using dITP or 7-deaza-dGTP
- Resolution of 500, 600 or more bases.

Plus:

- *Genetically* engineered for DNA sequencing
- Elimination of virtually all exonuclease activity
- High purity and specific activity
- Less pausing at secondary structures
- Higher processivity
- Extremely stable.

Sequenase,® since its introduction to the scientific community by United States Biochemical Corporation last year, has proven to be a superior enzyme for DNA sequencing. It is T7 DNA polymerase which has been chemically modified to have very low exonuclease activity. Now, through *in vitro* genetic manipulation of the gene for T7 DNA polymerase, a new version of Sequenase® is available.

Sequenase® Version 2.0 is preferable to the original Sequenase® (Version 1.0) for DNA sequencing. The virtual absence of exonuclease activity in Sequenase® Version 2.0 increases its processivity by decreasing pausing at regions of secondary structure.

In addition, it incorporates dITP more stably, further enhancing the use of this analog to remove compressions. It exhibits greater purity and stability than Sequenase® Version 1.0. USB will continue to supply the original Sequenase,® so the choice is yours. We think all of these advantages make Sequenase® Version 2.0 even more reliable for DNA sequencing in your laboratory.

Quality science guarantees your satisfaction.

I. Our unconditional guarantee:

If you try Sequenase® Version 2.0 or Sequenase® and are not satisfied, we will replace it (with either version of Sequenase,® Klenow, or AMV RT at your option) or refund your money.

II. Our free trial offer — the conclusive proof:

We want you to be the judge. If you are using another product for sequencing in your lab, we will provide you with a free Sequenase® Version 2.0 evaluation kit. Let the facts speak for themselves — you make the decision in your lab under your conditions. There are no catches — at USB your satisfaction is always our standard.

EMAG – MICRO 89
13 – 15 September 1989

An International Conference and Trade Exhibition is being organized in London jointly by the Royal Microscopical Society and the Electron Microscopy and Analysis Group of the Institute of Physics. It will see the coming together for this special occasion of the highly successful meetings run by the Institute of Physics (EMAG) and the Royal Microscopical Society (MICRO), with the Conference in the Institute of Education, London University, Bedford Way WC1 and the Trade Exhibition across Bedford Way in The Royal National Hotel.

This conference forms a part of "The Year of the Microscope" celebrating the first 150 years of the Royal Microscopical Society.

SCIENTIFIC PROGRAMME

Sessions

The conference will be divided into approximately 26 sessions in which original research presentations will be made. Each session will normally last half a day so that for most of the time four sessions will be in progress simultaneously. Normally two of these will be directed towards the biological and two towards the physical sciences.

Programme structure

Each session will comprise oral and poster presentations with the majority of contributed papers being presented as posters. Sessions may be preceded by Tutorial lectures and will normally have Invited speakers followed by a small number of selected talks from the Contributed papers.

Posters

Time will be allowed in the programme for poster viewing and in addition designated times will be timetabled when authors will be in attendance for discussion. Posters will be on display for the maximum time which can be programmed. Poster prizes will be awarded in several categories.

Publication

Short abstracts are required by 31 March. Abstract forms are available from the RMS Administrator at the address below. Authors will be notified regarding acceptance and mode of presentation in May and camera-ready manuscripts (four pages for contributed papers) are required by 13th September for publication in the two volumes (one Biological and one Physical) Conference Proceedings (I.O.P. Conference Series) to be published in December 1989. No distinction will be made in the published Proceedings between oral and poster presentations. Conference registration will include one volume of choice.

Invited speakers

The following speakers have agreed provisionally to present papers at the conference. So that coverage of rapidly advancing techniques will not be precluded, the programme will not be finalised until April 1989.

Dr. R.J. Hamers (Yorktown Heights, U.S.A.) "Developments in STM"
Prof. T.M. Jovin (Göttingen, W. Germany) "New aspects of fluorescent probes in biology"
Prof. D. Lansing-Taylor (Pittsburg, U.S.A.) "Multi-mode microscopy of cell dynamics"
Dr. J. Gillespie (Newcastle-upon-Tyne) "Single cell spectroscopy: A review"
Dr. J. Metcalfe (Cambridge) "Fluorescent molecular probes: A review"
Dr. M. Stewart (Cambridge) "Electron microscopy of frozen hydrated biological molecules"
Dr. P. Duncumb (Cambridge) "Superconductors: the role of electron microscopy and analysis"
Dr. C. Grovenor (Oxford) "Recent developments in atom probe microanalysis of materials with ultrafine microstructures"
Dr. L. Edelmann (Homburg/Saar) "Freeze substitution and low temperature embedding"
Dr. C. Chassard-Bouchaud (Parts) "SIMS in medicine and biology"
Dr. D.M. Shotton (Oxford) "Techniques of low light level imaging of Biological Specimens"
Dr. H.J. Tanke (Leiden, Netherlands) "Time-resolved fluorescence microscopy: Techniques and applications"
Dr. C.A. Warwick (New Jersey, U.S.A.) "Scanning cathodoluminescence of semiconducting materials"
Dr. E.D. Boyes (Delaware, U.S.A.) "Developments in low voltage SEM"

Prof. M. Rühle (Santa Barbara, U.S.A.) "HREM of ceramic/ceramic and metal/ceramic interface"
Prof. H. Hashimoto (Okayama, Japan) "High Resolution Microscopy of Dynamic Events"
Prof. A. Boyde (London) "Tandem scanning (confocal) microscopy and the third dimension"
Dr. A.J. Craven (Glasgow) "EELS techniques and applications"
Dr. R.S. Camplejohn (London) "Applications of flow cytometry"
Dr. P.J. Dobson (Oxford) "Reflection high energy diffraction and molecular beam epitaxy"
Dr. M. Hoppe (Wetzlar, W. Germany) "Problems solved by acoustic microscopy"
Prof. J. Kushibiki (Sendai, Japan) "Acoustic microspectroscopy"
Dr. D.A. Smith (Yorktown Heights, U.S.A.) "Interfaces and the microstructure of thin films"
Prof. J. Silcox (Cornell, U.S.A.) "Lithography"
Dr. L.P. Kok (Leiden, Netherlands) "Physics of microwave irradiation"
Dr. M. Boon (Leiden, Netherlands) "The application of microwave in pathology laboratories"
Mr. P. Jackson (Leeds) "Immunohistochemistry and the use of microwaves"
Dr. R.W. Horobin (Sheffield) "Overview of microwaves in morphological studies"
Prof. J. Venables (Sussex) "Auger reflection microscopy"
Dr. P. Kruit (Delft, Netherlands) "Coincidence methods in STEM"
Dr. N.C. Billingham (Sussex) "UV microscopy"
Dr. J.A. Reffner (Stamford, U.S.A.) "Molecular microscopical mapping with the FTIR microscope"

Contributed papers
Papers are invited on all aspects of microscopy and related techniques. They must contain new material not previously published. Authors can express preference for oral or poster presentation. With this in mind, selection of a contributed paper for oral presentation will be made, by the programme committee, in the interests of an attractive and coherent programme and complementing the invited talk(s).

Tutorial lectures
A number of tutorial lectures will take place throughout the Conference, preceding the appropriate session. These will be a feature of the meeting and are intended to introduce the interested non-expert to that field. The provisional list of tutorial lecturers and topics is as follows:

Prof. J.W. Steeds (Bristol) "Large angle CBED"
Dr. O.L. Krivanek (Pleasanton, C.A. U.S.A.) "Progress in parallel detection EELS'"
Dr. A. Dixon (Oxford) "Principles and applications of confocal fluorescence microscopy"
Dr. D. Haugland (Eugene, U.S.A.) "Fluorescent molecular probes in biology"
Prof. J.B. Pawley (Madison, U.S.A.) "The Micro World has three dimensions and sometimes four"
Dr. N.P. Carter (Cambridge) "Flow cytometry — What is it?"
Dr. P. Echlin (Cambridge) "Low temperature biological microscopy and analysis"

COMMERCIAL EXHIBITION

An exhibition of the latest microscopical instrumentation and all types of ancillary equipment will be held in the Royal National Hotel, just across the road from the location of the Conference. Admission to the exhibition is free of charge by Conference Badge or by Exhibition Only Badge and will provide delegates with an unrivalled opportunity to exchange views with the manufacturers on their range of products. Facilities for exhibitors wishing to give formal presentations, videos, etc. will be available.

Tickets for the Exhibition only are available from the RMS Administrator at the address below and from the registration desk once the Exhibition opens. The organisers acknowledge with gratitude the help and advice of the Trade Advisory Committee of the Royal Microscopical Society.

Abstract forms and further Information
Abstracts must be submitted on camera-ready forms in accordance with the instructions accompanying them. These can be obtained from the following address. The deadline for abstracts is 31 March 1989. An acknowledgement card will be sent by return post.

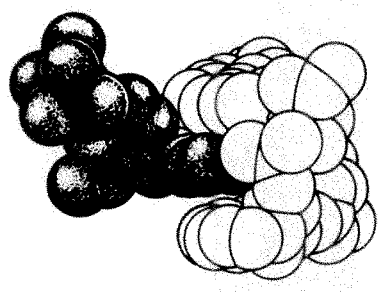
NEW

Journals from Macmillan



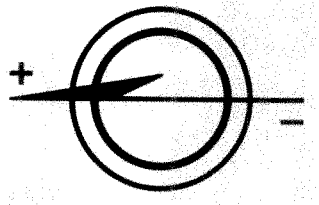
ONCOGENE

Editors:
UK: John Jenkins and Graham Currie
Marie Curie Foundation, Oxted, Surrey, UK
USA: E. Premkumar Reddy
The Wistar Institute, Philadelphia, USA

This journal includes full and detailed papers as well as short communications relevant to all aspects of oncogene research, including the following topics: cellular oncogenes and their mechanisms of activation, structure and functional aspects of their encoded proteins, oncogenes in RNA and DNA tumour viruses, presence of oncogenes in human tumours, relevance and biology, cell cycle control, immortalization, cellular senescence, regulatory genes and "anti-oncogenes", growth factors and receptors.

SAMPLE COPY REQUEST ☐

Anti-Cancer Drug Design



Editors:
UK: Stephen Neidle, Cancer Research Campaign Biomolecular Structure Research Unit, Sutton, Surrey, UK
USA: Stanley T. Crooke, Smith Kline & French Laboratories, Philadelphia, USA
Japan: Shigeru Tsukagoshi, Japanese Foundation for Cancer Research, Tokyo, Japan

This journal publishes original research papers, reflecting the increasing importance of the tools of structural and molecular biology as well as more classical methodologies.

SAMPLE COPY REQUEST ☐

APPLIED AND THEORETICAL ELECTROPHORESIS

An official publication of the International Electrophoresis Society

Reader Service No.39

Editor-in-Chief:
Carl R. Merril, Bethesda, MD., USA

This new journal aims to facilitate communications between researchers employing electrophoretic methods and those using the methods in a variety of applied settings. Its main goal is prompt publication of:–

- **Full length scientific articles**
- **Peer reviewed newsworthy items from both the academic and industrial worlds in the form of brief reports**
- **Review articles or supplements on major topics of general interest**

SAMPLE COPY REQUEST ☐

Are your gel documentation costs soaring?

We bring them down to earth!

Electronic instant photographic camera
for quick and inexpensive documentation of:

- ○ DNA electrophoresis gels
- ○ Protein gels
- ○ TLC plates

The camera's thermoelectrically cooled CCD image sensor and specially developed interference filters yield excellent discernibility of low-light fluorescent patterns. The images are stored in a frame buffer and displayed on a television monitor. If desired, contrast amplification, edge enhancement and baseline subtraction may be performed on the stored images.

Hardcopies are printed out on high-resolution thermal paper within 20 seconds.

The images can be transmitted to a personal computer for further processing.

Put Computers In Their Place

Personal computers are ideal for liquid scintillation data storage, manipulation and graphing...but what about controlling your liquid scintillation system? LS Systems are durable and last 10 to 20 years. Personal computers and software change rapidly. That's why Beckman LS systems allow you the freedom to change your data analysis system and software whenever you need.

Our LS systems give you accurate DPM for up to three isotopes simultaneously. And our library of personal computer software includes one or two-site receptor analysis, radioimmunoassays, data graphing, Lotus* and dBASE** capabilities, reference management, and more.

For accurate data and up-to-date analyses use the Beckman "Counter" Solution.

"The Counter Solution"

A NEW TITLE FROM ACADEMIC PRESS

JOURNAL OF AUTOIMMUNITY

EDITOR: **J.F. Bach** *Necker Hospital, Paris, France*

CO-EDITORS: **I.M. Roitt** *(U.K.)*, **C.R. Stiller** *(Canada)*, **N. Talal** *(U.S.A.)*

The *Journal of Autoimmunity* publishes papers related to the diverse aspects of autoimmunity; the mechanism of self-recognition, regulation of autoimmune responses, experimental autoimmune diseases, diagnostic autoantibody tests, and the epidemiology, pathophysiology and treatment of autoimmune diseases. Special but not exclusive interest will be given to papers dealing with genetic, molecular and cellular aspects of the discipline.

Research Areas Also Include

* **Rheumatology * Dermatology**
* **Endocrinology and Diabetes**
* **Nephrology * Haematology**
* **Immunopharmacology**

GBF / medac

A new, highly flexible plasmid vector system (the pJLA50X series) has been designed to optimize the cytoplasmic expression of genes, or of gene domains, in any chosen strain of E. coli. The principle is to maximize not only transcriptional, but also translational efficiency, in a fully regulatable way.

These vectors have been highly successfully employed in the over-expression of e. g. various human genes (cDNAs). In a derivative series (pJLA60X), translational stop codons have been inserted in all three reading frames downstream of the cloning sites.

Ref.: Schauder, B. et al., Gene 52 (1987) 279-283

You can order these vectors from:

Discover the Latest Advances in Biology

D. R. Knott, University of Saskatchewan

The Wheat Rusts – Breeding for Resistance

1989. 19 figures, 40 tables. Approx. 216 pages. (Monographs on Theoretical and Applied Genetics, Volume 12). Hard cover DM 168,-. ISBN 3-540-50459-1

This up-to-date review covers all aspects of the three wheat rusts - leaf rust, stem rust and yellow rust - and their interaction with wheat. Both detailed background information and practical procedures necessary for breeding rust-resistant wheat are supplied.

Zoophysiology

Series Editors: W. Burggren, S. Ishii, H. Langer, G. Neuweiler, D. J. Randall

Volume 25

G. D. Pollak, University of Texas; J. H. Casseday, Duke University Medical Center

The Neural Basis of Echolocation in Bats

1989. 82 figures. Approx. 155 pages. Hard cover DM 128,-. ISBN 3-540-50520-2

The present volume presents an integrated picture of the structure-function relationships of the chiropteran auditory system of bats from periphery to midbrain, ans shows how these special adaptions have evolved from a basic mammalian auditory system.

Volume 23

G. L. Kooyman, Scripps Institution of Oceanography

Diverse Divers

Physiology and Behavior

1989. 87 figures. Approx. 230 pages. Hard cover DM 178,-. ISBN 3-540-50274-2

This comprehensive study deals mainly with the various physiological responses to diving. The differences occurring in cases of anoxia and forced submersion are noted and a concept of predicting behavior from known physiological variables is developed.

Prices are subject to change without notice.

Y. P. S. Bajaj, New Delhi (Ed.)

Plant Protoplasts and Genetic Engineering I

1989. 152 figures. Approx. 460 pages. (Biotechnology in Agriculture and Forestry, Volume 8) Hard cover DM 378,-. ISBN 3-540-19194-1

This volume comprising 28 chapters by international experts deals with the isolation, fusion, culture, immobilization, cryopreservation and ultrastructural studies of plant protoplasts and the regeneration of somatic hybrids and cybrids. The technology and literature on the regeneration of complete plants from protoplasts of rice, potato, soybean, linseed, cabbage, chicory, lettuce, butterbur, orchids, citrus and some other tree species are discussed. Various methods of fusion and the determination of viability are also reviewed.

Acidic Deposition and Forest Soils

Context and Case Studies of the Southeastern U. S.

1989. 34 figures. VIII, 149 pages. (Ecological Studies, Volume 72). Hard cover DM 98,-. ISBN 3-540-96889-X

Acidic deposition has become a topic of major environmental concern in industrialized regions. Some areas have shown dramatic declines in forest growth, but the possible role of acidic deposition remains unclear. Whereas most research in the Southeastern U. S. has focused on the direct impact of sulfuric and nitric acids on plants, the unique study presented in this volume was undertaken to determine the role of indirect, soil-mediated effects.

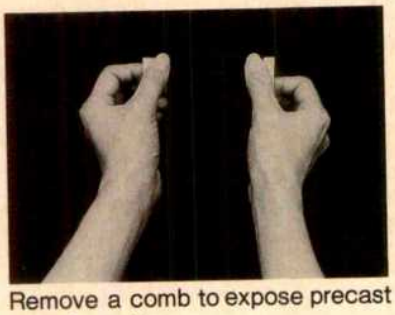
Cassette Electrophoresis System, Vertical Type



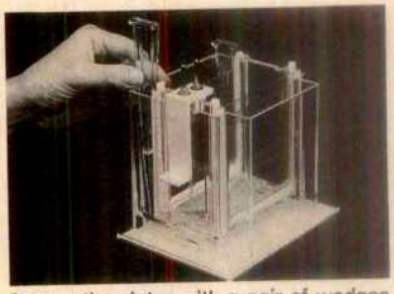
- **Rapid Run**
- **Excellent Resolution**
- **High Reproducibility**

Operations are as easy as opening a package·····!

Just open up a package to take out a gel plate

Remove a comb to expose precast sample wells

- **Time Saving**



–need not to make gels

- **Simple Operation**

–patented wedge system without leaks or clamps

Insert one or two gel plates

Secure the plates with a pair of wedges

Products

■Cassette Electrophoresis Unit "DAIICHI" U.S. Patent No.4,772,393

★Single, double and six gel devices for Mini Gels.
★Dual buffer tank design allows uniform heat dissipation for straight, smile-free patterns.

■PAG & SDS PAG PLATE 1010 & 0810

★Precast polyacrylamide gradient & single percent gels.
★Convenient sample application with 12 precast sample wells.
★10×10cm & 10×8cm cassettes fit most mini gel devices.

PAG (for Davis method)	4~15%
SDS-PAG (for Laemmli method)	4~20%, 10~20% 7.5%, 10%, 12.5%

Break away from manual routines. We've automated RNA extraction.

Applied Biosystems has announced a new breakthrough—automated purification of RNA with the Model 340A Nucleic Acid Extractor. With new chemistry, the instrument isolates high-quality, total cellular RNA. And it minimizes potential contamination by nucleases.

For more information on how to contact one of our eight worldwide subsidiaries, give us a call. We'd like to help you break into automated RNA and DNA extraction.

NATURE READER SERVICE CARDS
The quick and easy way to comprehensive product information.

SDS-PAGE, 2-D electrophoresis, blotting, and electro-elution. All in the same cell.

Every mini cell is fast; only one is versatile.

Electrophoretic blotting of two mini-gels can be completed in one hour. Minimum buffer requirements and a self contained cooling system are two advantages of this rapid miniature blotting cell.

SDS-PAGE electrophoresis is completed in only 40 minutes. The Mini-PROTEAN™ II cell's leakproof casting system and snap-on clamp assemblies simplify set-up procedures for running SDS-PAGE gels. Its capacity for up to 30 samples makes it ideal for rapid screening applications.

IEF tube gels for 2-D are finished in 90 minutes. High resolution 2-D analysis, including silver staining, is completed in half a day.

Preparative recovery of nucleic acids and proteins is easily accomplished with the Model 422 Electro-Eluter. Patented Membrane Caps with self contained dialysis membranes simplify assembly and insure leakproof sample collection with ≥ 80% sample recovery. Available as a stand-alone unit or as a module for the Mini-PROTEAN II cell.

All you need is one cell — the Mini-PROTEAN II SDS-PAGE electrophoresis cell. Three different modules are available to transform this popular cell into a mini-tube cell, a Mini Trans-Blot™ cell, or an electro-eluter.

Just remove one module and drop in another. It's that easy. Each module is also available with its own buffer tank and lid, which will make it a stand-alone instrument.

No other mini electrophoresis system offers such convenience and versatility. More than that, you'll economize on reagents, speed up your runs, and save substantially by not having to buy extra equipment as your electrophoresis applications expand.

For details on this innovative approach to mini electrophoresis, contact us and ask for Bulletin 1273.

Your First Choice for Cytokine Research Products

A history of firsts; a future of firsts.

In 1982, Genzyme introduced the first commercial source of Interleukin-1. Today, we offer the most complete line of products available for cytokine research, and tomorrow, we'll continue to provide you with new products relevant to your new needs.

Our complete product line includes:

Interleukins (IL)

- ○ Interleukin-1 (alpha and beta)
- ○ Interleukin-2
- ○ Interleukin-3
- ○ Interleukin-4
- ○ Interleukin-5
- ○ Interleukin-6
- ○ Antibodies to Interleukins
- ○ InterTest-2,™ IL-2 ELISA kit

Colony Stimulating Factors (CSF)

- ○ Granulocyte-Macrophage CSF
- ○ Granulocyte CSF
- ○ Macrophage CSF
- ○ Antibodies to CSF's
- ○ Factor-Test,™ GM-CSF ELISA Kit

Reader Service No.593

Tumor Necrosis Factor (TNF)

- ○ Ultrapure TNF-alpha
- ○ Recombinant TNF-alpha
- ○ Antibodies for Neutralizing TNF-alpha and TNF-beta (lymphotoxin)
- ○ Antibodies for Western Blot Analysis of TNF-alpha
- ○ TNF-Test,™ TNF-alpha RIA kit

Platelet-derived Growth Factor (PDGF)

- ○ Recombinant Human PDGF
- ○ Antibodies to PDGF

Additional Products for Immunology Research

- ○ Interferon-gamma
- ○ Antibodies to Interferon-gamma
- ○ Antibody to Erythropoietin
- ○ Recombinant Ultrapure Protein-A
- ○ Recombinant Protein-A Agarose
- ○ Chicken Collagen II

Our commitment to you.

Genzyme is committed to providing the research community with the highest quality products available. All of our products are subjected to rigorous quality control testing for purity, bioactivity, cross-reactivity, sterility and endotoxin.

In addition, Genzyme's scientific staff is ready to assist you with technical product support.

Order today for delivery tomorrow!

Our Cytokine products are available as both recombinant and natural preparations and are of human or murine origin. Genzyme also supplies monoclonal and polyclonal antibodies and complete immunoassay kits. For more information or to place an order for next day delivery, call or write today.

A Convenient and Broad Spectrum Cell Culture Antibiotic . . .

GENTAMYCIN SULFATE

Gentamycin Sulfate is the ideal cell culture antibiotic. It requires no refrigeration, remains active following autoclaving, and remains stable at 37°C up to 15 days. This extended stability and its tolerance of pH extremes allows long-term virus and tissue culture studies. Another advantage of Gentamycin Sulfate is the generally slow development of bacterial resistance.

Gentamycin Sulfate is a water soluble, bactericidal antibiotic of the aminoglycoside group derived from *Micromonospora purpurea*. Gentamycin Sulfate consists of three closely related components: Gentamycin C_1 ($C_{21}H_{43}N_5O_7$); Gentamycin C_2 ($C_{20}H_{41}N_5O_7$) and Gentamycin C_{1a} ($C_{19}H_{39}N_5O_7$). This antibiotic acts by inhibiting normal protein synthesis in susceptible microorganisms.

Gentamycin Sulfate has been shown to be nontoxic to viruses and mammalian cells at antibacterial and antimycroplasmal concentrations. Gentamycin Sulfate has wide range bactericidal effect on the following:

— *E. coli*
— *Citrobacter sp.*
— *Salmonella sp.*
— *Shigella sp.*
— *Klebisiella sp.*
— *Enterobacter sp.*
— *Serrattia sp.*
— *Bacillus sp.*
— *Clostridium sp.*
— *Corynebacterium sp.*
— *Listeria monocytogenes*
— *Pseudomonas aeruginosa*
— *Proteus sp.* (indole positive and indole negative)
— *Staphylococcus sp.* (including penicillin and methicillin resistant strains)
— Antimycroplasmal effect in media containing various strains of mycroplasma

Getting rid of poor people's debts

The US administration may have bungled its well-meant plan to lift the burden of indebtedness from the shoulders of the developing world.

WILL Mr Nicholas Brady, the new US Secretary of the Treasury, be the next victim of the Bush administration's unpreparedness? Last Friday, Brady stood up in Washington to outline a solution to the problem of the debts owed by the poorest countries in the world to the richer countries and their commercial banks. Going further than his predecessor, Mr James Baker (Secretary of State in the new administration), Brady argued for a reduction of the debts the poor countries cannot afford to repay. The details are still vague, but Brady urged that the World Bank and the International Monetary Fund (IMF) should have extra resources so as to be able to buy out the interests of the commercial banks in some of their outstanding loans.

But who now can lend more? Only Japan. To its credit, the government of Japan announced its approval of Brady's suggestions even before his speech had been delivered. It seems to be implicitly agreed that, in the outcome, Japan will exercise much greater influence in the international lending institutions, which Japan appears to welcome. The US administration is more cautious, saying only that the details of the Brady plan are still to be worked out. But Brady's speech will by itself set in train events that neither he nor the White House can control.

That something should be done, and urgently, is plain. The total indebtedness of the developing countries is estimated at $1.2 million million, some 20 per cent more than the annual federal budget of the United States. More than a third of the debt is owed by Latin American countries, most of whom cannot make the required repayments; the rest is scattered through the developing world, which is hardly in better shape. The way in which the prospects for development are crushed by this burden of debt is plain. The Bush administration deserves credit for recognizing more plainly than its predecessor that the debt imbalance is now the most serious threat to international stability.

So why not forgive the debt? Commercial banks in the West have been compelled by their auditors to accept that the loans they have made are unlikely ever to be fully repaid; during the past two years, they have written off roughly a third of the debts they are owed. But that realism does not in itself relieve developing countries of their debts, which remain nominally repayable in full. The banks set out to collect what they can from whom they can, pretending that the writing off of a third of the value of their loans is irrelevant in negotiations with individual borrowers. Without an agreement not yet reached between parties not yet identified, the banks have no choice.

But you cannot get water out of a stone, which is why the past year has been occupied with schemes for rescheduling developing country debt. The hope had been to stretch out debt and interest repayments over longer periods and, crucially, to lend the debtors extra cash to stimulate economic growth so that the attenuated debts would eventually be repaid in full. The first task has been relatively easy; the commercial banks lose nothing by rescheduling debts that would otherwise be repudiated. But extra cash has not materialized on a scale sufficient to allow the debtor countries to grow their way out of trouble. Instead, extra loans have often been barely enough to cover extra interest, and have been accompanied by economic constraints laid down by IMF which have often seemed intolerably onerous, whence the past month's disturbances in Caracas, the capital of Venezuela.

Brady's ambition is to short-circuit this process, which is admirable, and to do so within the context of a free market, which again makes sense. But how? This is where the plan tails off into thin air. In some form, funds provided by industrial countries (chiefly Japan) must be used to buy out the interests of the commercial banks in their doubtful loan agreements, presumably at a large discount. The banks would swap doubtful assets (their loans) for bonds whose face value is perhaps only a third as much, but which are somehow guaranteed by the international institutions. The obvious snag is that Brady's announcement gives debtor states an incentive immediately to diminish the book value of the loans they owe, while there can be no assurance that all the commercial banks owed money will take part in whatever scheme is eventually worked out.

It would have been better to put the horse before the cart, and to have negotiated the details of a workable scheme with those who will have to meet the costs (the commercial banks and the Japanese banking system) before giving other interested parties a chance prudently to escape their obligations. It is also plain that there can be no permanent settlement without an understanding of the extent to which the poor countries can expect to work off their debts by trading freely with their creditors. The

United States has a particular, but urgent, need to devise a coherent policy on relations with Latin America, shamefully neglected in the past eight years. But, now that Brady has spoken, all this has to be arranged by tomorrow or, at the latest, the day after tomorrow. This is a slipshod way in which to deal with such an important matter. □

All greens now

Politicians anxious about the environment seem no more ready than their predecessors to make prudent choices.

THE most obvious intellectual weakness of the environmental movement, already apparent in its first flowering in the late 1960s, is its habitual failure to tell what is important. So much is now clear in the general response to the otherwise welcome recognition by senior politicians that the greenhouse effect must be taken seriously. Suddenly, it seems, a whole range of public policy is legitimately to be dominated by what are called ecological imperatives. One result will be that public and private resources will be squandered needlessly. Another is that our capacity to deal with the important problems will be seriously impaired.

Here is a sample of how the wind is blowing. A few months ago, the government of the Netherlands decided to require that new motor cars should meet emission standards more stringent than those agreed by the European Community in a famous compromise reached only with the greatest difficulty four years ago — and to which the Dutch were then a party. The result (unless the decision is overturned by the European Court of Justice) may be that Dutch motor-cars will in future emit less pollution while the rest of Europe reverts to its older ways. In West Germany (see page 194), self-evidently innocuous experiments with genetically engineered plants must be carried out in a limbo that will be removed only when there is a legislation on the subject, likely to be the most restrictive in Europe. In Britain last week, a plan to build a railway link between the channel tunnel and the rest of Britain was hastily rerouted to meet environmental objections, at an estimated extra cost of £500 million. Mrs Margaret Thatcher, the British prime minister, is both consistent and right to say that the extra cost must be met by those who use the railway, which is unlikely to be commissioned until several years after the tunnel. But, on the Principle of the Conservation of Money, the extra £500 million spent to preserve the gentility of rural Kent will be £500 million less to spend on other worthwhile causes.

Collective sanity requires a better sense of proportion. All environmental protection in which governments are involved is at bottom a public purchase — one made on behalf of a whole community with resources drawn from it either by taxation or by the payment of user fees. The government of the Netherlands, for example, has implicitly arranged that the costs of reducing exhaust emissions will be met by Dutch motorists, who will pay more for their cars and more for their fuel. (The Netherlands may hope to recoup some of the extra cost if Dutch motor-manufacturers find they have an edge in the domestic market-place over their competitors.)

The British railway to the channel tunnel is in the same case. The preservation of a corridor through Kent has been judged worth £500 million, which the operators of the railway will have to find and then recover by means of a tax (extra fare) on the railway's users. Meeting the extra capital cost out of public funds (which the British government will be asked to do) would simply redistribute the burden.

Sadly, in all of these decisions, the communities on whose behalf governments have acted (or, in the case of West Germany, failed to act) have not been presented with a choice. Yet the extra cost of the British railway far exceeds what would be the cost of drawing up and enforcing legislation to make British farm foodstuffs free from Salmonella infection but may be a more prudent investment. So should not the governments committing these substantial sums of money ostensibly in the public interest ask the communities they are supposed to serve what choice they should make between the alternatives? Surprisingly, even the British government, which likes to think of itself as strong, seems to prefer to be pushed about in one direction or another as local or otherwise special interests make themselves heard.

The conversion of people such as Thatcher to a proper concern about the greenhouse effect should have engendered a more resolute view of environmental costs, but has not. Yet the crude arithmetic of the case is as accessible as the back of the nearest envelope. Suppose there is eventually a carbon dioxide convention, and that countries such as Britain have to generate all their electricity from fuels other than hydrocarbons. That could entail building 50 million kW of nuclear generating capacity over say 20 years, which would work out at an investment of £5,000 million a year if the extra cost of nuclear generating capacity is merely £2,000 a kilowatt. That simple arithmetic does not imply that nuclear capacity is the only alternative, but unconventional sources of electricity would probably on present form be more expensive, nor does it allow for the replacement of fossil fuels in other energy-consuming machinery, vehicles for example.

In short, if it should eventually be necessary to reduce carbon dioxide emissions, the costs are likely to be orders of magnitude greater even than the sums now being frittered away on the railway to the channel tunnel. One way of responding to that dilemma is to say that if measures to combat the greenhouse effect are likely to cost several thousand million pounds a year, £500 million or so for Kent is mere chicken-feed. But that is also the route to national impoverishment. The more prudent course is to require than people should choose. Thatcher, above all politicians of her persuasion, should be eager to remind people that that is not merely their right but their duty. □

Changes in misconduct investigation planned

- Present procedures declared inadequate
- New legislation may obstruct plans

Washington

THE US Public Health Service (PHS) has decided to create a new mechanism for dealing with scientific misconduct by establishing an Office of Scientific Integrity in the office of the director of the National Institutes of Health (NIH).

This move comes after months of internal debate on how best to tackle the growing concern that current procedures for investigating alleged scientific misconduct are inadequate. But the rapid implementation of the new plans may not be easy, for they seem to be at odds with legislation about to be introduced in Congress.

Virtually nobody is satisfied with present procedures for dealing with scientific misconduct. Investigations have taken much longer than expected, there have been squabbles over who should investigate cases and Congress has felt that NIH may lack the will to tackle the difficult issues that inevitably arise. A report from the Institute of Medicine urges that encouraging proper research conduct is an important part of preventing misconduct (see ***Nature* 337, 588;** 16 February 1989). Accordingly, the new office at NIH will be responsible not only for investigating alleged misconduct but also for promoting high standards of laboratory practice.

The new office will make recommendations to the Assistant Secretary for Health, who is the head of PHS. The plan also calls for an Office of Scientific Integrity Review in the office of the assistant secretary to oversee investigations by the NIH office and to help develop policies for dealing with issues of integrity and misconduct.

Although the new office of scientific integrity will be located in the office of the NIH director, it will be responsible for investigations and procedures for all PHS agencies, including the Alcohol, Drug Abuse and Mental Health Administration and the Centers for Disease Control.

Congress has put pressure on PHS to make changes in the way it deals with misconduct. Last year, there were several hearings that drew attention to problems in current procedures. Earlier this year, Representative Henry Waxman (Democrat, California) asked the Inspector General of the Department of Health and Human Services to determine whether PHS was putting sufficient resources into its investigations.

Legislation is at present being drafted by Waxman and Representative John Dingell (Democrat, Michigan) — head of the powerful House of Representatives Energy and Commerce Committee — that would also create an office of scientific integrity, but place it in the assistant secretary's office, not at NIH. It seems certain that Congress will require assurance of a serious commitment to investigating misconduct before it agrees to let NIH retain primary responsibility for that role.

Joseph Palca

US SCIENCE POLICY

Who should decide policy?

Washington

THERE is a need for a new government body to set national goals in science and technology in the United States. That much was agreed at hearings held over the past two weeks by the House of Representatives Subcommittee on Science, Research and Technology and the Senate Committee on the Budget. But the form that the new policy-making body should take was a matter of great debate.

The consensus that the United States lacks a coherent national policy in science and technology has arisen for two reasons. In recent years, emerging big projects, such as the sequencing of the human genome and the study of global climate change, have cut across government agency boundaries. But there is no central government body to determine the relative importance of these projects, and the budgets they should command. On another front, Congress and industry are realizing that the United States is being left behind in development of key new technology, such as high-definition television (HDTV); that is also perceived as due to a lack of a guiding national policy.

Former presidential science adviser George Keyworth revived the idea of a new department at the House hearing. But several subcommittee members and witnesses dismissed this idea. William Carey, former executive director of the American Association for the Advancement of Science and a former assistant director of the Bureau of the Budget, says a new department would be "crippled" by lack of support from other departments and agencies. And when Clyde Prestowitz of the Carnegie Endowment made a similar suggestion at the Senate hearing, Senator Ernest Hollings (Democrat, South Carolina) said "We would all be dead and gone" before such a department is realized.

Carey instead favours proposals recently put forward by the National Academy of Sciences which call for collaboration between the Office of Management and Budget and the president's science adviser in determining priorities, objectives and budgets of large projects. A step in that direction has already been taken by the Committee on Earth Sciences of the Federal Coordinating Council for Science, Engineering and Technology, which has for the first time prepared a cross-agency budget for research on global climate change in 1989 and 1990.

Under the academy proposal, cross-cutting research activities would be reviewed by budget and appropriations committees in Congress before being broken down for consideration by individual agencies. Another approach, put forward by Lawson Crowe (University of Colorado), is to establish a national commission, composed largely of scientists, that would rank large-scale projects according to scientific merit, social benefit and "programmatic implications".

But most subcommittee members seemed more concerned with mechanisms for strengthening economic competitiveness than with scientific policy. Almost every witness was asked what should be done about HDTV, which is fast becoming the touchstone in Congress of the competitiveness of US industry.

The hearings are almost certainly a harbinger of a year of debate in Congress over the question of how to set science and technology policy. The same issues are certain to come up again when President George Bush's plans for giving his science adviser the status of an assistant to the president and for appointing a panel of independent advisers are put forward as legislation.

David Swinbanks

NUCLEAR POWER

Industry struggles on despite opposition

Washington

WILL nuclear power play a role in the future energy plans of the United States? The Nuclear Power Oversight Committee, a nuclear power industry body, issued a white paper (policy document) last week calling for an easing of government regulations so to encourage the building of new nuclear plants. But industry analysts say nuclear power is dying in the United States, not because of regulation but because the industry has lost economic and political viability.

James O'Connor, chairman of the committee, says that growth in demand for electricity in recent years has far exceeded even the power industry's projections and that the United States is now running "perilously close to capacity margins that leave very little room for error". He points to the emergency measures, such as voltage reduction, that many utility companies had to take during last summer's heat wave as a sign of the serious supply difficulties that lie ahead.

If demand for electricity in the United States continues to grow at 2–3 per cent a year, 120–220 large new nuclear power plants will have to be built by the turn of the century. The white paper argues that new plants could offer the most cost-effective new source if the government were to ease regulatory controls by, for example, introducing a single-licence system instead of, as now, requiring utility companies to obtain both a construction and an operating licence for new plants.

But Christopher Flavin, vice-president for research at the Worldwatch Institute, who has been monitoring the nuclear industry for the past decade, says the industry's figures for the cost of nuclear power are based on existing plants both old and new. Since the Three Mile Island accident, increased safety requirements have quadrupled plant construction costs and nuclear power is now more than "twice as expensive as competing sources". But O'Connor argues that the biggest additional cost in building new plants is delay due to complex regulatory controls.

Concern about global climate change has prompted Congress to reassess the pros and cons of nuclear power, an energy source free from carbon dioxide emissions, as the industry is ready to point out. But Flavin says that, if the new legislation introduced by Congress to deal with global warming is accepted, there will be a "stampede" towards the development of renewable energy sources, not nuclear power.

Public opposition to nuclear power in the United States remains widespread. Legislators introducing global warming bills have attentuated or omitted references to nuclear power to gain wider acceptance.

David Swinbanks

Legacy of Three Mile Island

Boston

A DECADE after the partial meltdown of the Three Mile Island (TMI) Unit 2 reactor near Harrisburg, Pennsylvania, on 28 March 1979, cleaning up continues at a cost of $1,000 million — nearly $300 million more than the cost of building the reactor in the first place. But the implications of the accident for the commercial nuclear industry are almost certainly far greater.

So far, workers have removed most of the damaged nuclear fuel from the Unit 2 reactor vessel. This has been accomplished by a team of more than 1,000 people, including a group operating specially designed equipment from a rotating platform above the reactor vessel. Working almost continuously since October 1985, the clean-up team has removed radioactive debris ranging in size from gravel-like material to a fused hard crust, up to 5 feet thick, formed from the molten fuel rods during the accident.

If all goes according to plan, the 'defuelling' process should be complete by the end of 1990, when Unit 2 will be shut and monitored for approximately 30 years, until the end of the planned lifespan of the operating Unit 1 reactor nearby. A full decommissioning and dismantling of Unit 2 will be postponed until the job can be undertaken for both reactor units together, according to Doug Bedell, spokesman for GPU Nuclear, TMI's owner.

Bedell emphasizes that enough material has been removed to dispel any chance of "a critical event", but he acknowledges that, because residual caesium has permeated the basement walls, "unacceptable" and potentially dangerous levels of radiation will still be left in the basement area of the Unit 2 reactor until decommissioning begins next century.

Since the clean-up began, 150 tons of highly radioactive debris has been hauled away from the reactor. But because there is not yet a functioning repository for high-level commercial nuclear waste anywhere in the United States, the debris from TMI continues to be stored "temporarily" at the National Engineering Laboratory in Idaho where researchers have studied the material to reconstruct the precise course of the accident. A plan to evaporate the remaining 2 million gallons of radioactive water at the TMI site still awaits approval from the Nuclear Regulatory Commission.

The accident at TMI Unit 2 began after only 11 months of operation when a pump providing feedwater to the reactor core clogged during full power operation. After the plant shut down automatically, a relief valve opened to diminish the built-up pressure and temperature in the reactor, letting out steam and water.

Undetected by the operators, this valve remained open for 2 hours, allowing the escape of nearly a million gallons of the coolant water covering the reactor fuel. As approximately half of the reactor core became uncovered, the radioactive water overflowed designed catchments, collecting in the basements of the reactor and auxiliary buildings. Without the coolant water, temperatures in the pressurized-water reactor rose quickly, causing some of the uranium fuel to melt.

The accident at TMI prompted a widespread response in the nuclear industry. Within weeks of the disaster, the Electric Power Research Institute (supported by the utilities) established an organization called the Nuclear Safety Analysis Center (NSAC) to analyse the accident and to inform other utilities of any future malfunctions or other information that could be useful.

Later that year, the industry also formed the safety-oriented group called the Institute of Nuclear Power Operations (INPO). Among its other functions, INPO runs a computer network linking nuclear power plant operators with experts at INPO and NSAC to provide instantaneous advice and information. According to William Layman, since the accident at TMI, the industry has learned that "the price of safety is eternal vigilance".

But although the industry can point to strengthened safety procedure in the aftermath of the TMI accident, most agree that the incident's greatest legacy is a sustained level of lingering public fear and opposition to nuclear power in the United States.

More than 2,000 lawsuits claiming health and psychological damage from the TMI accident are still pending, despite measurements after the accident that showed that the highest possible whole-body dose to any one individual was less than 100 millirem, or only slightly greater than the average most people are exposed to from medical and dental radiation in a year.

Most observers agree that the TMI accident was a clear turning-point for the US nuclear industry, although poor performance, steeply rising construction costs and slowly growing demand for electricity may earlier have presaged the industry's decline. Although performance has improved and dependence on nuclear power as a fraction of energy supply in the United States has since grown, no plants have been ordered since the accident and all of the 47 units ordered in the United States since 1974 have been cancelled.

VETERINARY SCIENCE

Plan to close schools resisted

London

THE review of veterinary science at British universities, published earlier this year, has been so fiercely attacked that it seems unlikely that its proposals will be implemented unchanged. The review (see *Nature* **337**, 294; 26 January 1989) recommended that the veterinary schools at Glasgow and Cambridge should be closed.

Representatives of the veterinary profession now say that the closures will increase manpower shortages, lead to a lowering of standards in the veterinary profession and persuade more British researchers to go to the United States to work. In the universities, even those who agree that some reduction of capacity would be wise say the working party has picked the wrong targets.

The review is one of a series being carried out for the University Grants Committee in an attempt to decide how to use most efficiently the limited financial resources of Britain's universities. The working party for the veterinary sciences, whose chairman is Sir Ralph Riley, was told that a maximum intake of 335 students a year will be necessary to meet future manpower requirements and was asked to frame its recommendations accordingly.

To ensure that clinical sciences are taught with satisfactory spread and depth, the working party concluded that each school should have at least 36 clinical teachers. With some redistribution of posts, four schools, instead of the present six, would be sufficient. In order that the remaining schools are as widely spaced geographically as possible, the working party concluded that one of the two schools in Scotland and one in the South-East of England would have to be closed down.

Because there is room for expansion at Edinburgh, the Glasgow school was selected for closure. But the review says that the Edinburgh school should cease to exist in name, and that a new Scottish school would be formed by a merger of the two.

The Royal College of Veterinary Surgeons and the British Veterinary Association last week launched a furious attack on these proposals. They argue that future manpower needs require an intake of 400–500 students a year, which four schools could not provide. The registrar of the college, Alistair Porter, says the shortage of veterinary surgeons has already brought an influx of manpower from other countries.

The president of the Royal College, John Parsons, says that researchers would prefer to move to the United States rather than agree to be relocated in Britain. Since the announcement of the proposed closures in January, job offers have started coming in to researchers at Glasgow and Cambridge.

But those at the highly regarded department of veterinary pathology at the University of Glasgow are unlikely to be lured away. Even if the Glasgow school does move, there are provisions in the Riley report for this department to continue to exist at the University of Glasgow. The campaign against closure of the veterinary school in Glasgow has won widespread support in the local community: a petition with more than 300,000 signatures is to be sent to the prime minister.

Christine McGourty

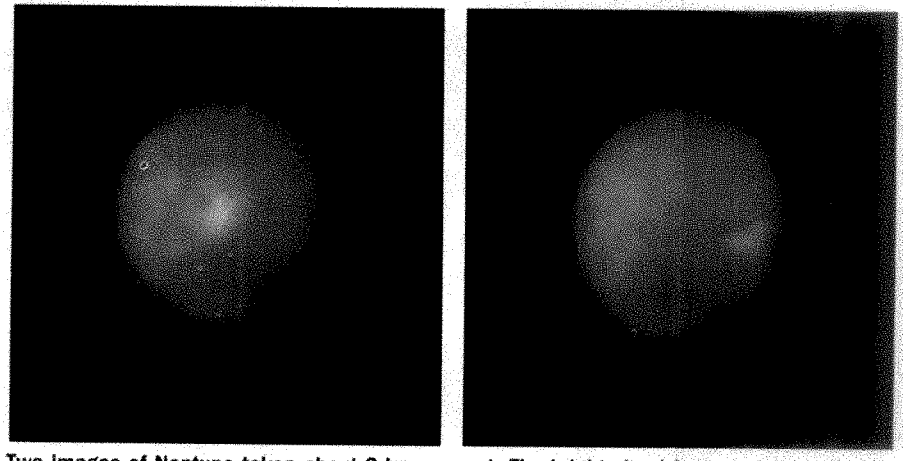
SCIENCE JOBS

Students hang back, researchers may quit

Sydney

THE poor job market for Australian scientists is apparently starting to cause problems for the future of Australian science. The signs of trouble are clear from the figures for university enrolment for this academic year. According to a report by Australian Vice-Chancellors Committee, universities have had to lower entry standards to find enough science students. At the University of Sydney, entry scores in the science faculty dropped from 320 out of a possible 500 in 1987 to 300 this year, the lowest entry aggregate for any faculty. The University of Melbourne was forced to drop entry requirements from 295 in 1988 to 279 this year in order to fill its quota of science students.

But even those already on the career ladder are finding the climb tough. Seventy-five per cent of non-tenured Commonwealth Scientific and Industrial Research Organisation (CSIRO) scientists are unhappy with their career prospects, according to a survey by the recently formed Australian Science Action group, headed by Dr Greg Tanner, a CSIRO plant scientist. Forty per cent of the total sample size of 175 say they are prepared to leave Australia. Of these, 28 per cent indicated that they would pursue science overseas, while the rest say they would leave science altogether.



The CSIRO study shows that disillusion is greatest among younger postdoctoral researchers without tenure. The disaffection is particularly striking among biologists and chemists; those in the physical sciences less commonly regarded their prospects as poor. Women scientists with families are also discouraged about staying in science because of the reduced number of part-time positions available.

Tania Ewing

NEPTUNE FLY-BY

Voyager's first glimpse of distant planet raises NASA's hopes

PROSPECTS for Voyager 2's fly-by of Neptune on 24 August are encouraging, according to the mission controllers at the Jet Propulsion Laboratory in Pasadena. The colour images shown here, taken on 23 January when Voyager was about 185 million miles (309 million km) from the planet, already show detail down to 3,500 miles (6,000 km), better than that available from the best telescope images from Earth. The fact that distinct cloud features are visible when the spacecraft is still so distant suggests that images obtained during August will show far more detail than was visible in the atmosphere of Uranus, which Voyager 2 encountered in January 1986. The natural colour of Neptune, like that of Uranus, is a pale blue-green, caused by methane gas in the atmosphere, which absorbs red light. The images here were obtained through violet, clear and orange filters. □

Two images of Neptune taken about 2 hours apart. The bright cloud feature visible near the centre of Neptune's disk in the earlier (left-hand) image has moved to the right edge of the planet in the later image. This is in line with the 17- to 18-hour rotation calculated from Earth-based observations. A dark band of clouds, similar to structures seen on Jupiter, Saturn and Uranus, can be seen encircling the southern pole. □

PLAGIARISM DISPUTE

Clinical researchers at odds

Washington

A FEDERAL appeals court has written the latest chapter in a bitter dispute over plagiarism between a former faculty member of Albert Einstein College of Medicine in New York and her mentor, now vice-chairman of nuclear medicine at the medical school. A three-judge panel overturned a lower court's ruling, and declared that Leonard Freeman violated copyright law when he put his name on a document prepared by Heidi Weissmann, but Freeman's attorneys have appealed against the latest decision. The case threatens to drag on.

Told one way, there seems little doubt that Freeman misappropriated Weissmann's work. In August 1987, Freeman was invited to present work on liver imaging in a review course at Mount Sinai School of Medicine in New York. Freeman took a syllabus prepared by Weissmann for a similar course sponsored by the Radiological Society of North America in 1985, deleted Weissmann's name from the manuscript and put his in its place, and changed the title from "Hepatobiliary Imaging" to "Gastrointestinal Nuclear Medicine Hepatobiliary Imaging". The same syllabus appeared in a book published in Taiwan under Freeman's name after a symposium in December 1986 in the Republic of China.

But the case can also be read differently. Weissmann and Freeman began their association when she was a resident at Einstein in 1977, and had collaborated on liver-imaging work since 1980. After finishing her residence, Weissmann became a faculty member at Einstein, working in Freeman's division.

The 1985 syllabus used by Weissmann was largely drawn from previous versions of the syllabus which were jointly produced, but which differed in some references, illustrations and some new text. Furthermore, when Weissmann filed her suit to prevent Freeman from presenting the syllabus at Mount Sinai, she was in the midst of a lawsuit accusing Einstein of sexual discrimination over issues of salary and sabbatical leave.

A district court judge in New York agreed with Freeman's contention that the syllabus was a product of collaborative research, and a continually evolving 'stock' piece to be used when either was called upon to teach a course in hepatobiliary imaging techniques. The judge ruled that Freeman should be considered a joint author of the syllabus, and therefore could not be guilty of violating copyright of it. He also ruled that Weissmann's modifications to the 1985 syllabus were insufficient to support separate copyright protection and that, even if Freeman was not considered a joint author of the syllabus, his intended use of the document fell under the 'fair use' doctrine as it was intended for teaching and not personal profit.

But the appeals court saw things differently. In a 2–1 decision, the court ruled that Freeman's use of the syllabus was a violation of copyright. The majority opinion states that the decision of the lower court "stands copyright law on its head" by concluding that joint authorship of prior work "automatically makes the two joint authors co-owners of the derivative work". The court goes on to state that originality is rightly prized in law, and alludes to Dostoevsky's example in *The Idiot* that a person's worth in revolutionary Russia "did not depend so much on money or position as it did on one's originality". The appeals court also ruled that, although he did not stand to gain financially from the copyright infringement, Freeman did gain in stature professionally by passing Weissmann's work off as his own.

Einstein and Montefiore Medical Center, where both worked, have been firmly behind Freeman throughout the dispute. Part of Freeman's legal costs have been met by his employer. An open letter from Montefiore's president Spencer Foreman following the lower court's ruling last May declared that the "Federal District Court has completely vindicated our colleague Leonard M.Freeman", and refers to Weissmann as "a former Montefiore employee and former student", rather than as a former faculty member. The letter ends with "I know you are all as pleased as I am with the decision reached by the federal court".

Weissmann is now out of work. The medical school maintains that she resigned when she failed to return to work after a sabbatical which ended in September 1987. Weissmann says she was fired because when she tried to go to her office in August of that year, days after taking legal steps to prevent Freeman from handing out the syllabus at Mount Sinai, hospital security guards confronted her and demanded that she hand over her office keys. Freeman, meanwhile, has been promoted to vice-chairman of his department.

Freeman says the dispute should never have gone to court.Weissmann says she by-passed university mechanisms for resolving disputes in the copyright case because she did not think the university would give her case adequate attention.

Einstein has had a poor track record in its attitude towards female faculty. It has been the object of a class action suit filed in the 1970s alleging sexual discrimination on salaries that has still not been settled. Eugene Girden, a lawyer for Freeman, says it is ironical that Weissmann is suing Freeman, as he was one of her strongest supporters at the university.

Weissmann's case has been taken up by the National Coalition for Universities in the Public Interest, a Washington watchdog group, which intends to file new charges in Weissmann's discrimination suit still pending in New York State court. Leonard Minsky, the coalition's executive director, argues that Weissmann's experience is just one of a series of cases involving plagiarism, sexual discrimination and conflict of interest in US universities.

Joseph Palca

MENTAL HEALTH

Sterilization protests

Munich

A PROPOSED new law that would make it legal to sterilize people judged mentally incompetent without their consent has prompted a vigorous protest in West Germany from those who fear the law might some day be used to justify enforced sterilizations of a broader class of people.

The provisions on sterilization are part of an otherwise welcome reform of the rights of mentally disabled people. The legislation would ban the sterilization of minors, and has been well received on that account across the political spectrum, especially because of its emphasis on counselling and support for people unable to speak for themselves. But critics say that the legislation also contains a potentially dangerous loophole that might at some future stage be widened by allowing the sterilization of adults who are mentally incompetent.

Hitherto, up to 1,000 sterilizations a year have been carried out in West Germany on people — minors and adults — deemed legally incapable of handling their own affairs. Many of these sterilizations are done at the request of parents of mentally handicapped children. Under West German law, incapacitated people have had no legal recourse against the procedure.

The new legislation permits the sterilization of people who do not specifically object in cases where pregnancy would create an "emergency situation". Any objection on the part of the person in question would result in the cancelling of the sterilization.

The Green Party, a judges' organization and handicapped rights groups have protested against the law and are preparing to fight it in parliament. The current law, which dates back to 1900, deprives mentally incompetent adults of all rights, leaving them the equivalent of a child in legal terms. The new law was meant to be a landmark in a series of social programmes that have been staggering through parliament in recent months. The proposal has been sent to both houses of the West German parliament for discussion. The government hopes to gain approval for the law by the end of this year. Steven Dickman

LAKE BAIKAL

Invitation from Soviet centre

London

PLANS to found an international research centre on Lake Baikal in south-east Siberia have been formally agreed in the Soviet Union, where the Soviet Academy of Sciences has deputed responsibility for the project to its Siberian Division. The division is now inviting putative members of the centre to declare their interest, and plans to hold a constitutional conference at Irkutsk in the second half of this year.

The formal announcement, contained in a cable to the Editor of *Nature*, is as follows: The Praesidium of the Siberian Division of the Academy of Sciences of the USSR announces its intention of organizing the Baikal Centre for Fundamental Ecological Research — an organization open for the collaboration of Soviet scientists and scientists of all other countries in studies of the greatest ancient freshwater lake, Lake Baikal.

The facilities of this centre are sited, and will be further developed, at Listvyanka, on the shore of Baikal, and in Irkutsk, 70 km away. The Limnological Institute at Irkutsk will provide research vessels (six ships), laboratory rooms, expeditions, equipment, hotel rooms, etc., as agreed with participating groups and contracted for.

It is proposed that the scientific programme of the centre should include the following topics:

- Interdisciplinary studies of the Baikal ecosystem using the techniques of hydrodynamics, hydrochemistry, hydrobiology, remote sensing and mathematics in order to create a conceptual working model of this ecosystem.
- Studies of the speciation of the unique Baikal endemic complex of some 1,500 organisms and of the evolution of their nucleic acids and proteins.
- Investigation of the global transfer of elements and priority pollutants.
- The development of methods of environmental monitoring.
- Geological studies of Lake Baikal and of the history of its formation.

The Baikal International Centre will be operated by an international board of directors appointed by the founding parties. These will include the Siberian Division of the Academy of Sciences of the USSR, other Soviet organizations and organizations from other countries which agree to support the centre financially and to participate in its activities.

The board of directors will consider proposals for research projects and will select those to be carried out in each succeeding year on the basis of the reports of international referees. It will also decide what proportion of the budget will be devoted to each project selected in advance of each year's research.

Potential founding members of the Baikal International Centre — scientific institutes, scientific societies and international agencies — are hereby invited to open discussions with the Limnological Institute to clarify the framework of the agreement with the Siberian Division regarding participation in and support for the activity of the centre. Please write or cable to Professor M. A. Grachev, Lermontova 281, 664033 Irkutsk, USSR.

Inquirers will be supplied at their request with a draft charter of the centre, a list of the scientists who have already endorsed the concept of the centre and who have participated in collaborative research at Baikal as well as with any other relevant information.

It is hoped to hold a conference with representatives of the founding members of the centre at Irkutsk in the second half of 1989.

The cable is signed "Praesidium of the Siberian Division of the Academy of Sciences" and has been verified by telephone in a conversation with Professor Grachev. A general account of the Siberian Division's plans will be found in *Nature* **337**, 111; 12 January 1989. □

■ See page 209 of this issue for Professor Grachev's account of the canine distemper virus infection of Lake Baikal seals.

US UNIVERSITIES

MIT studies relations with Lincoln Laboratory

Boston

THE Massachusetts Institute of Technology (MIT) has announced the formation of a committee to investigate the university's relationship with the federally sponsored Lincoln Laboratory in Lexington, Massachusetts. The laboratory's $386-million annual budget is paid by the United States government, but the institute operates the facility.

At the core of the inquiry is the laboratory's emphasis on defence-related research involving radar and advanced electronics. Much of the work at the laboratory is classified, despite a university policy that eschews classified research on campus.

Paul Gray, president of MIT, says the new committee, headed by Joel Moses, chairman of MIT's electrical engineering and computer science department, will "explore alternative methods" for administering the Lincoln Laboratory. Gray has asked the committee to report by September. The group's twelve members also include Jerome B. Weisner, former president of MIT, Francis E. Low, former MIT provost, and Walker Morrow, Jr, director of Lincoln Laboratory. Seth Shulman

NEWS IN BRIEF

Third shuttle launch

Washington

THE third space shuttle launch since flights resumed took place last Monday (13 March) when the shuttle Discovery lifted off from Cape Canaveral in Florida. The lift-off was delayed one hour and forty minutes by poor weather conditions at the launch site. The mission's primary goal is to deploy a third tracking and data relay satellite that will complete a system of communications satellites in geosynchronous orbit that facilitate much higher data rates from spacecraft to ground stations. The new system is essential to make optimal use of data from the Hubble Space Telescope to be launched in December. This telescope was costly and expectations of it are high (see page 199).

The next shuttle mission, scheduled for 28 April on the shuttle Atlantis, will launch the Magellan spacecraft, a planetary probe bound for Venus. J.P.

Blaser to retire from PSI

Munich

J. P. BLASER will be retiring in the spring of 1990 as director of the Swiss Paul Scherrer Institute (PSI) for nuclear research in Villigen, near Zurich. The institute is currently seeking a replacement. Blaser, 66, was formerly director at the Swiss Institute for Nuclear Research, which was fused with the Federal Institute for Reactor Research at the end of 1987 to form PSI. S.D.

New authority in view

London

The task of reaching international consensus on how to combat global warming was tackled last week at an international conference on the environment held in the Hague, and organized by the governments of France, the Netherlands and Norway.

The declaration at the end of the conference calls for a new authority to be set up in the United Nations to be responsible for combating global warming. It says that the authority should undertake or commission scientific research and ensure the distribution of information between nations, including the sharing of technology. The authority would set standards for protection of the atmosphere and monitor compliance. But the conference decided not to endorse the imposition of economic sanctions on offending nations; measures to promote compliance would be referred to the International Court of Justice.

It was agreed, however, that developing countries should be compensated for any burden placed on them by the regulations, according to their responsibility for pollution. The organizers were criticized for their selective invitations — the United States and the Soviet Union were among those not invited. But the Dutch say all nations were invited to sign the declaration. C.McG.

REMOTE SENSING

SPOT on, but Landsats off?

Paris & Washington

US and French remote-sensing satellites are facing very different futures. EOSAT, the Earth Observation Satellite Company that operates the two orbiting Landsat satellites for the National Oceanic and Atmospheric Administration (NOAA), has been instructed to begin shutdown procedures for both satellites, putting them in a stand-by mode from the end of this month. By contrast, SPOT, the French Earth-observing satellite, had its third anniversary in space marked by a book about its history*.

The chief reason for cutting down the Landsat programme is money. Both Landsats 4 and 5 have exceeded their design lives, and although they are still providing useful information, neither the White House nor Congress has been interested in spending money on upgrading them.

NOAA is obliged to provide EOSAT with money to operate the two satellites, but with with its own budget thinly stretched, the agency has been looking to EOSAT revenues to help defray expenses. EOSAT has responded by arguing that current Landsat revenues are needed to prepare for Landsat 6, now due to be launched in 1991.

EOSAT maintains that $9.4 million would allow it to keep operating the two Landsats until the end of the fiscal year (at the end of September). Although the details of a package have not been worked out, NOAA assistant administrator Thomas Pyke last week told a congressional subcommittee that the Bush administration is committed to keeping Landsats 4 and 5 operating until a policy review of the programme is completed. The new National Space Council, chaired by Vice-President Dan Quayle, is coordinating the effort to find money in the budgets of federal agencies that use Landsat data.

Although still operational, SPOT is beginning to show signs of ageing, and a decision will soon have to be made whether to launch its younger sister, SPOT 2, as planned, later this year. To delay the launch would save money in the short term for the financially stretched French space programme, but the gamble could be too risky.

Seen as a white elephant by all other European countries except Sweden and Belgium, SPOT was financed and built almost entirely with French money. Now, with more than 300,000 high-resolution images in its owners' archives for sale to anyone who wants them for as little as $450, SPOT has convinced even sceptics of its value.

The US Department of Defense came to respect SPOT two years ago, when *Aviation Week and Space Technology* published photographs bought over the counter from SPOT Image Corporation that showed Soviet naval installations. The Pentagon was worried by the realization that anyone could also buy pictures of defence installations in the United States.

SPOT 2 should have been launched last year, but a long setback in the European Ariane rocket launch programme meant that SPOT 1 was kept in service. Although it still sends 700 images each day, one of its two data buffers is out of action and a faulty sensor in each of the two high-resolution cameras has reduced image quality. If the other buffer should fail, details of some of the most strategic par of the globe would be unavailable, and th satellite's commercial value would b drastically reduced.

The French space research cent (CNES) has booked a place for SPOT aboard Ariane flight 34, due in Septen ber. But the French space programme heaving under the burden of recent finar cial commitments to the European Spac Agency and CNES would like to delay th launch so long as SPOT 1 is working wel Although CNES says that SPOT 2 coul always be launched at short notice, if th flight 34 option is not taken up, a failure i SPOT 1 would leave France with only a exotic photograph album to sell unt another launcher is free, which might no be for several months.

Peter Coles & Joseph Palca

ENVIRONMENTAL RELEASE

Pink petunias sow controversy in West Germany

Munich

A CONTROVERSIAL proposal to plant 40,000 genetically engineered pink petunias has been approved by a West German panel, but the future of the experiment remains in doubt. It is the first time that release of a plant containing recombinant DNA has been approved in West Germany. But the federal Health Ministry must pass judgement on the experiment before planting can begin.

Saedler — expressing a lack of optimism.

The experiment itself is not expected to pose a danger to the environment, but opponents fear that it will convince the public that all release experiments are harmless. The experiment is important because it should force better definition for each phase of the now vague licensing procedure. Challenges to approval could come from one of several offices within the federal Health Ministry, the federa Environment Ministry or the *Land* of Nort Rhine-Westphalia.

Biological release is a controversial issue in West Germany, as shown by the storm of protest that greeted Bayreuth geneticist Walter Klingmüller when, in 1987, he carried out an unauthorized experiment with nitrogen-fixing *Rhizobium* bacteria (see *Nature* 328, 568; 1987). In 1985, there was a bomb attack on the Max Planck Institute (MPI) for Breeding Research in Cologne, which has planned the petunia experiment.

Release experiments must now be undertaken in the legal vacuum preceding the long-awaited introduction into parliament of a 'basic law' for regulating genetic engineering. The Central Commission for Biological Safety, the body that unanimously approved the petunia experiment, can request only voluntary compliance with its regulations.

The experiment will demonstrate the behaviour in petunia of so-called 'jumping genes' (transposons). A maize gene has been introduced into the petunia that turns them an unnatural pink colour. If a transposon should jump into the middle of this coloration gene, it is expected to leave parts of the flower white. Among other things, the researchers hope to tell whether transposons move systematically to particular sites, which may have an important bearing on plant evolution.

The jumping event is expected to occur in only one out of every 5,000 to 10,000 plants. For this reason, the experiment must be performed on such a large scale outside a greenhouse.

Heinz Saedler of MPI, the project leader, says that planting must begin by July at the latest if the experiment is to be done this year. But he is "not too optimistic", given the number of federal and *Land* authorities that might hold it up. **Steven Dickman**

POLISH RESEARCH

Solidarity calls for change

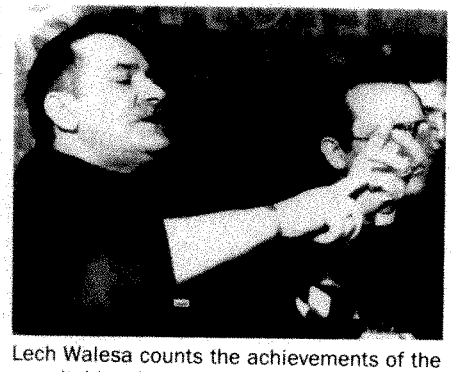
London

POLAND's multi-viewpoint 'round table' of experts, convened to seek a solution to the country's long-standing economic and social problems and from which has emerged the concession of open elections to one of the two parliamentary chambers, is also agreed on at least one thing: the urgent need for improvements in science and education.

At the opening of the subgroup on science and education last month, statements by the co-chairmen, Education Minister Jacek Fisiak for the government/party side and Professor Henryk Samsonowicz, former rector of Warsaw University, for the Solidarity/opposition wing, turned out to be virtually interchangeable.

Both said that Polish science and higher education have been damaged by long years of financial neglect, low wages and the lack of social prestige for teachers, and the restriction on the universities' rights to decide their own staffing policy, research and teaching plans.

The difference between the two spokesmen was chiefly one of timing: Solidarity wants immediate change, the official side would prefer to go more slowly. But by the final meeting of the subgroup last Saturday, a timetable had been agreed.



Although the round table includes representatives of all strata of Polish society, from Politburo members to clerics, philosophers, steelworkers and private farmers, its main achievement (and one that took several months to negotiate) has been to bring to the official conference table some of the chief figures from the 'democratic opposition' and the Solidarity movement.

Thus the education and science group includes such scholars as Stefan Amsterdamski and Wladyslaw Kunicki-Goldfinger from the Society of Academic Courses ('Flying University') of the late 1970s, Wiktor Kulerski, Solidarity's main spokesman on education during its legal existence (1980–81) and later a leader of underground Solidarity for the Warsaw region, and Wladyslaw Findeisen, who was removed from his post as rector of Warsaw Technical University in 1985 for refusing to discipline students who took part in pro-Solidarity rallies.

Likewise, the medical subgroup was co-chaired by Dr Zofia Kuratowska, whose haematological clinic was closed in 1985 in reprisal for her work among internees during the martial law period. And Janusz Onyszkiewicz, the Warsaw University lecturer in mathematical logic, resumed his former role of chief press spokesman for Solidarity — at least for the duration of the round table.

But the presence of Solidarity at the round table does not mean that life in Poland is completely back to the *status quo ante* martial law. As Samsonowicz noted, several cases of teachers and lecturers dismissed or penalized on political grounds during the martial law period are still outstanding. Fisiak has accepted a list of these cases "for review" and told a press conference that many other professionals are now being reinstated, there could be no reason why teachers and lecturers should not have the same satisfaction.

This represents a major policy shift. The rationale behind the education ministry's power to intervene against university staffs on political grounds, laid down in the 1985 higher education act, is precisely that teachers and lecturers are not comparable with other kinds of workers because they influence and shape the outlook of the next generation.

Lech Walesa counts the achievements of the roundtable talks last week (AP).

The 1985 act, which largely negated the liberalizations of the 'Solidarity' period and which was introduced in the face of concerted protest from the universities, is now itself scheduled for revision. But shortly after the subgroup began work, Fisiak's promise to restore a measure of autonomy to the universities seemed imperilled when student demonstrations in Krakow took a violent and overtly anti-Soviet note. The reforms, warned government press spokesman Jerzy Urban, depended on university authorities realizing that "autonomy does not mean anarchy".

Solidarity spokesmen have nevertheless been urging that if the banned pro-Solidarity Independent Students' Association (NZS) was reinstated, the students would not have to take to the streets to make their grievances known. The round table, Lech Walesa said, needs three legs in order to stand firm. Two legs had been provided by government promises to legalize Solidarity and the private farmers' organiztion 'Rural Solidarity'. The third 'leg' — legalization of the NZS — was eventually promised, during a meeting last week btween Walesa and Interior Minister General Czeslaw Kiszczak.

DEFENCE RESEARCH

Industry co-sponsorship

Paris

YVES Sillard, the former French coordinator of the European EUREKA programme seeking industrial co-sponsorship for competitive product research, thinks the principle could be extended to defence research. Sillard, who recently took over as head of the French Committee on Armaments (DGA), would like to see industry put up venture capital for pre-production studies of new military applications, in the expectation that military approval would be rewarded with government production contracts.

Military research now accounts for more than a third of French government research and development spending (about $4,000 million). Sillard believes that as European trade barriers fall in 1992, there will be opportunities for transnational collaboration, even if some domains (such as nuclear arms) would not be suitable. Sillard's idea is being studied by the DGA before being put to other European defence agencies.

Peter Coles

INFORMATION TECHNOLOGY

No action on research

London

THE British government last week rejected calls from the House of Commons Trade and Industry Committee for an increase in the number of undergraduate and graduate courses in information technology (IT) in order to tackle an emerging skills shortage.

The committee had said, in a report on IT, that there are 30,000 unfilled vacancies for people with IT skills and that the shortage was worsening. But the government now says, in a policy paper setting out policy on IT, that measures to combat the shortage have already been introduced. A £43-million programme launched four years ago will by 1990 have provided 5,000 extra places on undergraduate and post-graduate courses, it said.

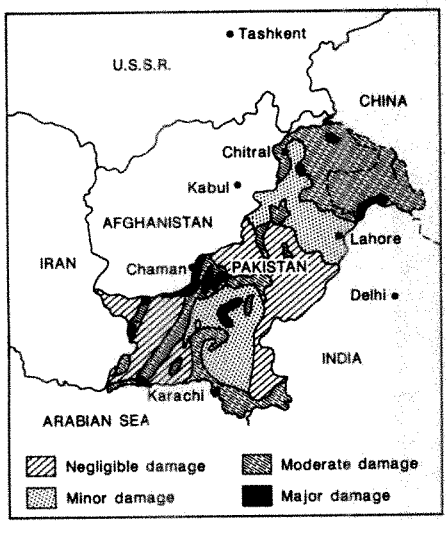
It also rejected the committee's call for increased spending on research and development in IT, saying that £100 million will be spent by the government next year for this purpose. It stressed that the chief responsibility for financing industrially relevant research lies with industry, and rejected the committee's suggestion that the government should encourage industrial investment in IT by identifying a target level of research. It said that the government would not require that investment be disclosed in company accounts, as this would be burdensome to industry.

The committee had called for reinstatement of the post of minister for information technology, on the grounds that since the post was abolished there has been no significant increase in interest in the subject among ministers. But the government says it is neither feasible nor desirable to locate responsibility for all aspects of IT policy in a single department.

Christine McGourty

Earthquake risk

SIR—The recent earthquake in Armenia has once again focused attention on the need to adhere to some minimal building code in order to minimize earthquake hazards, especially in developing countries in seismically active zones (*Nature* **336,** 625; 1988). This is the only practicable solution for such countries, where the development of facilities and capabilities for data-acquisition and data-processing to monitor the build-up of strain and to predict its release in earthquakes is still far in the future.



Towards the middle of the next century, the developing countries in Asia with a history of destructive earthquakes will experience a growth of development in communication, energy, irrigation and industry, financed largely by international agencies and executed under the supervision of experts in the countries concerned.

These agencies and experts must make themselves responsible for minimizing natural hazards, of which earthquakes are the most sudden and destructive. They should perhaps specify that a seismic zoning map should be available when a large project is planned.

A seismic zoning map of Pakistan (see below) is being published for the information of international funding agencies and for those involved in structural designs for dams, power and chemical plants and so on in Pakistan.

This map, constructed from macro-earthquakes data from 1905 to 1979, can be used for risk assessment if one assumes that if ground motion of a certain intensity is experienced once in a certain area, it is likely to be experienced again in that area. Map adapted from Building Code of Pakistan, Ministry of Housing & Works, Islamabad, 1986, pp 11–38 to 52.

Looking-glass land

SIR—Our solution of the molecular structure of foot and mouth disease virus (*Nature* **337**, 709; 1989) involved an intriguing number of coincidental connections with the life and career of Lewis Carroll, the mathematician and author of the Alice in Wonderland books. He was born and spent his early years in Daresbury, the location of the SERC synchrotron source where the X-ray diffraction data were collected. He later moved to Oxford to teach mathematics and it is there that the data were analysed and the structure of the virus solved. Carroll also owned a house in Guildford, which is close to Pirbright, where the virus was grown and crystallized. The final link was provided by the representation of the virus structure featured on the cover of *Nature*. This picture is as the virus would have been seen by Alice through the looking-glass — it was printed as the mirror image of the true structural organization of the particle.

Aluminium limits

SIR—It has been known since 1983 that a blood serum level of aluminium in excess of 0.1 mg per l presents a significant risk of neurological damage[1], yet the permissible level of aluminium in European Communities domestic water remains at 0.2 mg per l. Are we not expecting to much from the European kidney?

Improbability

SIR—Respondents to Bruce Denness's query (*Nature* **336,** 614; 1988 and **337,** 498; 1989) are surely correct that scientists need not be too much concerned with far-fetched theories that are fabulously contrived to explain phenomena. But the fantastical context of the discussion should not be permitted to obscure a serious, but related, scientific problem.

One reason to reject the spontaneous or wilful creation of the Universe in the recent past is that we have a good explanation that hinges improbabilities of the recent past on the even more improbable (in the sense of lower entropy) less-recent past. But in a Big-Bang cosmology, this particular buck can be passed back only so far. How did the earliest times come to be so improbable? Roger Penrose has estimated[1] that the original conditions of our Universe, if generated randomly, had a likelihood comparable to 1 part in 10 to the power of 10^{123}. It is not clear that such a staggeringly improbable initial condition is any easier to arrange than admittedly preposterous, direct fabrication of a recent state of the Universe replete with falsified history.

Anthropic principle

SIR—I was surprised to learn in the slightly misleading report from M. Abramowicz and G. F. R. Ellis (*Nature* **337**, 411–412; 1989) that a feature of the Venice Conference on cosmology and philosophy (18–19 November 1988) had been my abandonment of the final anthropic principle. In fact, my talk was concerned primarily with other subjects. However, the documented discussion following other speakers reveals that the scientific basis of this proposal was presented and defended. It is particularly interesting in view of recent ideas about information processing and complexity. For a truer picture, I refer the interested reader to the conference proceedings which will be published by Cambridge University Press under the editorship of U. Curi.

Retraction test

SIR—I agree with John Maddox (*Nature* **338,** 13; 1989) on the importance of full retraction by an author who discovers nontrivial mistakes in his or her previously published work. It is a litmus test of scientific integrity.

To any researcher hesitant about publishing a retraction when necessary, I would say that I can immediately think of colleagues whose reputations went up in my estimation when they published retractions.

I was horrified to read that some funding bodies apply the opposite criterion. This must be stopped.

Risks from ionizing radiation

R.H. Clarke and T.R.E. Southwood

For the public in the United Kingdom — and the United States — natural radon is a far greater radiation hazard than are emissions from nuclear installations.

RADON indoors now accounts for nearly half of the average UK population exposure to ionizing radiation. We believe that the extent of the variation in exposure to radon in the United Kingdom and elsewhere and its magnitude in relation to exposures from other natural and artificial sources needs to be more widely recognized. Such information should influence attitudes to risk and the allocation of resources for programmes of radiological protection. We cannot help but observe the large investment being made in the United Kingdom to reduce doses from the Sellafield nuclear reprocessing plant[1], in comparison with that being made to reduce exposure from indoor exposure to radon[2].

The National Radiological Protection Board monitors the exposure of the UK population to all sources of ionizing radiation. We have just completed our latest assessment[3], which is based as far as possible on measurements of exposure from natural background radiation, medical diagnostic procedures, fallout of radionuclides and occupations involving use of radiation. Some exposures are too low to be measured, in which case we calculate doses using environmental and dosimetric models, such as consumer products and the average dose from effluents from nuclear power stations.

We estimate that the average exposure within the United Kingdom is now 2.5 millisieverts (mSv) per year compared with just under 2.2 mSv per year when we last reported[4]. The increase is principally due to a re-assessment of exposure to indoor radon gas as a result of our national survey[5] of the levels and the re-evaluation of the dose–intake relationship for radon and its daughters. The contributions of various sources of radiation in 1988 are listed in Table 1 in descending order of importance, natural sources being identified and the doses from 1984 being given for comparison. There have been reductions in occupational exposure and from nuclear effluents in the period since our 1984 report, but these are small compared with the increased estimate for radon.

In the United States, the national average exposure to ionizing radiation has been estimated recently to be 3.6 mSv, more than 1.4 times the UK average[6]. (The breakdown of components of dose in the United States is also shown in Table 1.) Medical exposures to individuals are higher in the United States than in the United Kingdom, as are doses from consumer products and other miscellaneous sources. It is clear that higher average radon exposures in the United States account for most of the difference from the UK figures, although the US distribution is not yet well known.

National averages are useful for broad comparisons, but any average conceals a wide range. The dose received by single individuals may depart markedly from the average, depending on their mode of life and geographical location. Therefore, in the figure, we contrast doses received by different groups in the UK population with the national average figures. The area of each pie diagram is proportional to the total dose received, and the slices represent the percentages from the various sources.

TABLE 1 Contributions to average radiation exposure (mSv)

UK 1988	UK 1984	Source	USA 1987
1.2	0.7	*Radon from earth materials (98 per cent from indoor exposure)	2.0 †
0.35	0.40	*Terrestrial γ-rays	0.28

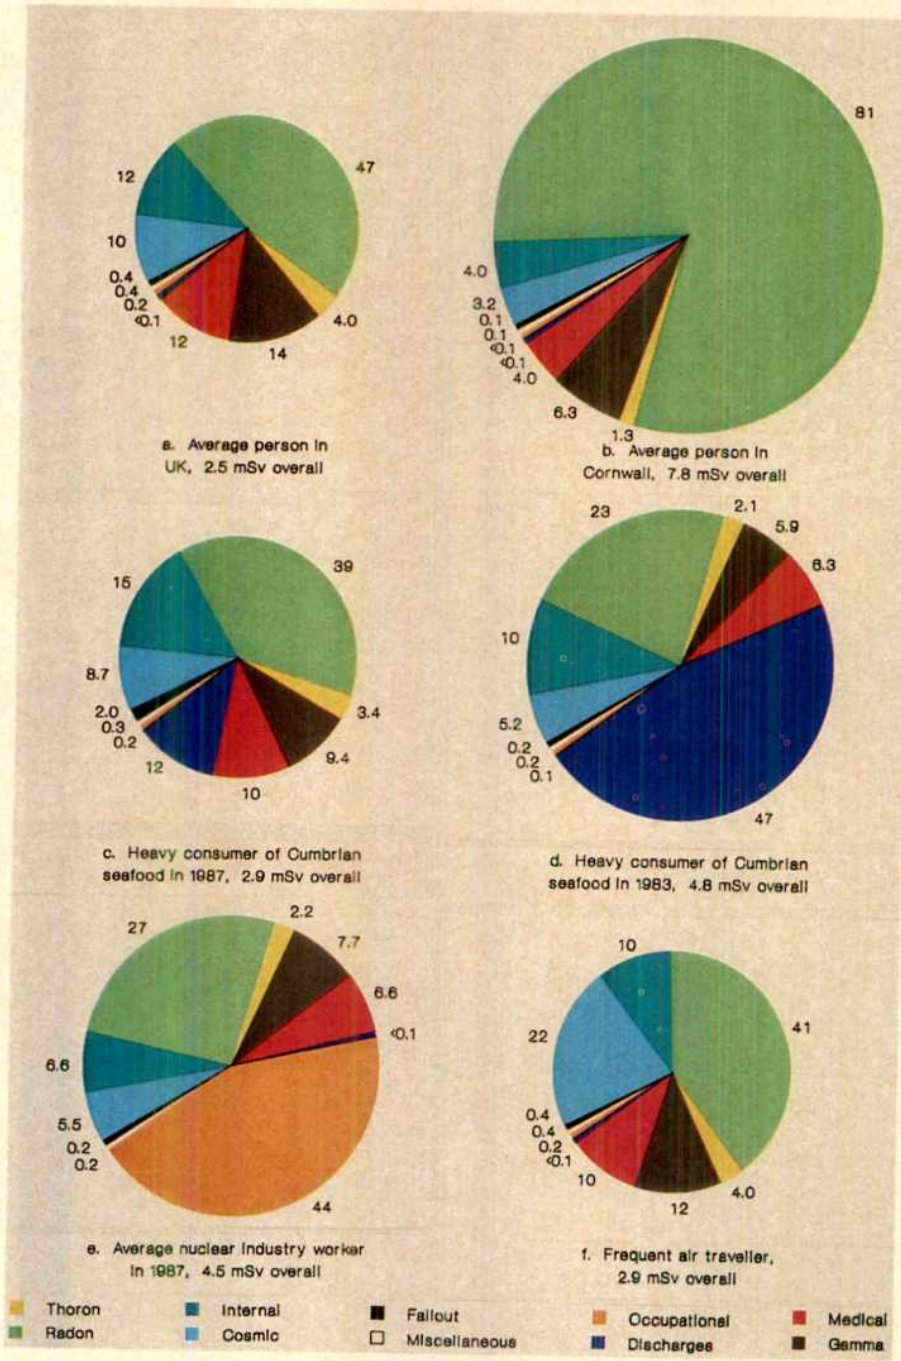
0.01	0.01	Miscellaneous sources	0.05-0.13
0.005	0.009	Occupational exposure	0.009
0.001	0.002	Radioactive effluent discharges	0.0005
TOTAL 2.5	2.2		TOTAL 3.6



* Natural sources
† Includes thoron

In general, the highest doses in the United Kingdom arise in Cornwall and Devon in the south-west of England. By comparison with the UK average (*a* in the figure), the average dose received in Cornwall (*b*) is slightly more than three times higher (7.8 compared with 2.5 mSv), principally because of the nature of the local geology. The terrestrial γ-radiation is slightly higher, but the main contribution to the increase arises from the effects of the inhalation indoors of radon and its daughters (81 per cent of the total). Radon in houses arises primarily through seepage from the underlying ground, caused by the slight under-pressure indoors. Better insulation reduces ventilation in houses and thus increases radon exposure because of the lower rate of changes of fresh air[7]. But apparently obvious remedies, such as the use of an extractor fan, may cause an increase in under-pressure and draw more radon from the ground, making the situation worse[2].

We know of parts of Cornwall, and some other areas of the United Kingdom, where the exposure of individuals can rise to more than 20 mSv in a year when more than 90 per cent of the dose results from indoor radon[7].

The public and the media in Britain have generally been more concerned with the safety of artificial sources of radionuclides, in particular the effects of discharges to the Irish Sea from the Sellafield reprocessing plant in Cumbria in the north of England. Those receiving the highest doses in this region are the avid consumers of seafoods collected off the Cumbrian coast near the plant (*c* in the figure), whose dose is increased to 0.33 mSv compared with the UK average of 0.001 mSv[5]. Nevertheless, the total exposure of these people is 2.9 mSv per year, not much higher than the national average, and much less than the value of 4.8 mSv per year (*d* in the figure) which we reported in 1984 (ref. 4). These lower doses result from the reduced discharges of radionuclides from the nuclear reprocessing plant at Sellafield achieved since 1984.

We also note the increase in natural internal exposure associated with high shellfish consumption (*c* in the figure) from the increased intake of natural α-emitting radionuclides (mainly polonium-210) that are concentrated by shellfish. This increase, which is unrelated to any man-made source of radionuclides, can raise the annual internal dose of an individual by 0.14 mSv (from 0.30 to 0.44 mSv), just under half the additional dose now received by those most exposed to the Sellafield discharges. Because of the pattern of rainfall in May 1986, people living in Cumbria (and in other parts of western Britain) are still exposed to slightly higher than average doses of radiation because of residual fallout from the

Variations of annual radiation dose in the United Kingdom compared with the average. Pie areas are proportional to dose and percentage segments to sources.

reactor accident at Chernobyl (0.05 mSv in 1987 compared with the average of 0.01 mSv).

The effect of occupational exposure on the pattern of total dose is shown in *e* in the figure, which is the dose for a typical UK nuclear industry worker in 1987. Occupational exposure does, of course, vary from one individual to another, as well as for the same individual at different times of life. (The average dose of 2 mSv is obtained from about 20,000 reactor workers receiving doses averaging less than 1 mSv per year together with more than 5,000 reprocessing-plant workers averaging about 5 mSv per year[3].)

Other features of modern life have a significant effect on dose received — because of the reduction in the screening effect of the atmosphere with height, for example, air travel increases exposure to cosmic radiation[9]. Frequent air travellers who, in a year, fly for 100 hours (about five subsonic return flights between Britain and the west coast of North America, or a weekly flight between London and Scotland or a nearby European country) would increase their dose from that source from 0.25 to 0.65 mSv per year. This would lead to a total dose of 2.9 mSv per year as shown in *f* in the figure — the same dose as received by those most exposed to discharges from Sellafield.

Our new survey[3] shows that radon is th greatest single source of radiation to th population. Radon and its daughters ar α-emitters, which are more biologicall damaging than β- and γ-radiations. A there a real risk of lung cancer from rado exposure in the home? There are dat from studies on uranium miners who hav been chronically exposed to radon and it daughters[9], and it is encouraging that ou estimate for the risks of lung exposur derived from the Japanese atom-bom survivors[10] is close to the figure for th uranium miners. Experiments on rodent exposed to radon result in similar risks and confirm a linear relationship betwee risk and dose[11].

Depending on the exact risk factor applied, radon exposure in the Unitec Kingdom might be responsible for 6 pe cent or more of the annual incidence o lung cancer (41,000). We recommend ar action level for radon exposure in home corresponding to 20 mSv in a year[12], anc similar action levels are being considered in Sweden and the EEC[13]. In the Unitec States, action is recommended at 7.5 mSv in a year[14], and there is legislative pressure for abatement as well as for programmes of intervention and research[15]. Our advice in 1987[12] was that lifetime exposure to radon at its action level would give rise to about a 2 per cent chance of an individual dying of lung cancer. It is now clear that this figure has to be revised substantially to at least 5 per cent, and that action to reduce the risks from radon are even more urgently required. □

Reproducible Success!

The new Thermocycler from Braun is "high-tech", because ...

it automates all ***labour-intensive,*** *repetitive* ***temperature control routines*** *in the laboratory which require* ***rapid temperature changes*** *and* ***high reproducibility.***

Some of the advantages:

- *High sample capacity*
- *Robust instrument for permanent use in routine and research*
- *Free selection of process parameters by means of integrated computer system*
- *Computer-guided process control with integrated error messages*
- *Amortization of instrument within one year of routine use*

But the Thermocycler offers more than that! Go and see for yourself! Just phone for information!

Dr. Asche, Telephone FRG (56 61) 71-39 43, *will be pleased to help you.*

THE CHLAMYDOMONAS SOURCEBOOK
A Comprehensive Guide to Biology and Laboratory Use

E. H. Harris

March 1989, c. 802 pages, £90.00

ISBN: 0.12.326880.X

The green alga *Chlamydomonas* is widely used as an experimental model system for studies in cellular and molecular biology and in particular plant molecular biology. This book is the only single modern compendium of information on its biology, molecular biology, and genetics. It includes laboratory exercises designed for student use, and features a comprehensive bibliography. In addition to information on the basic biology, the following practical laboratory information is included:

- Methods for culture, and preparation of media
- Preservation of cultures
- Lists of inhibitors and other additives to culture media
- Help with common laboratory problems such as contamination
- Methods for tetrad analysis

Contents: An Overview of the Genus *Chlamydomonas*, Culture and Storage Methods. Cell Architecture and Division. The Sexual Cycle. Motility. Metabolism. Photosynthesis. Organelle Heredity. Nucleic Acids and Protein Synthesis. Genetic Analysis. Mutant Strains. Procedures and Resources. References. Index.

FORM AND FUNCTION IN BIRDS
Volume 4

Edited by **A. S. King, J. McLelland,**

December 1988, 608 pp, £89.00

ISBN: 0.12.407504.5

Set Price Volumes 1-4: £236.00

This work is the most comprehensive treatise on avian anatomy available. This volume completes this classic work, which has engaged its editors and authors for the last decade. It represents the premier reference for a wide variety of subjects in avian anatomy and physiology and stands as a tribute to years of careful and imaginative research.

Contents: *S.F.Perry,* Mainstreams in the Evolution of Vertebrate Respiratory Structures. *J. McLelland,* Larynx and Trachea. *A. S. King,* Functional Anatomy of the Syrinx. *J. H. Brackenbury.* Functions of the Syrinx and the Control of Sound Production. *J. McLelland,* Anatomy of the Lungs and Air Sacs. *M. A. Abdalla,* The Blood Supply to the Lung. *J. N. Maina,* The Morphometry of the Avian Lung. *P. Scheid and J. Piper,* Respiratory Mechanics and Air Flow in Birds. *F. L. Powell and P. Scheid,* Physiology of Gas Exchange in the Avian Respiratory System. *M. Gleeson and V. Molony,* Control of Breathing. *J. E. Breazile and H. G. Hartwig,* Central Nervous System. Index.

NUCLEO-CYTOPLASMIC TRANSPORT

Edited by **R. Peters,**

November 1988, 192 pp, £14.95

ISBN: 0.12.552100.6

Reprinted from a special issue of the journal Cell Biology International Reports

The nine papers in this research level book review current research on transport mechanisms of molecules between the cytoplasm and the nucleus of the cell.

RADIATION MEASUREMENT IN PHOTOBIOLOGY

Edited by **B. L. Diffey**

February 1989, 248 pages, £29.50

ISBN: 0.12.215840.7

This practical and detailed text outlines the basic methods for measuring light radiation. Scientists working in photobiology will find the information presented here beneficial, whether they are working in the field or laboratory, with humans, animals, or plants.

Contents: *A. W. S. Tarrant,* Basic Principles of Light Measurement. *A. D. Wilson,* Optical Radiation Detectors. *T. M. Goodman,* Calibration of Light Sources and Detectors *P. Gibson and B. L. Diffey,* Techniques for Spectroradiometry and Broad Band Radiometry. *M. G. Holmes* Action Spectroscopy. *D. Phillips,* Applications of Lasers in Photobiology and Photochemistry. *B. L. Diffey,* Ultraviolet Radiation Dosimetry with Polysulphone Film *L. O. Björn,* Computer Programs for Estimating Ultraviolet Radiation in Daylight. *M. Seyfried,* Optical Radiation Interactions with Living Tissue. Index.

HANDBOOK OF MARINE MAMMALS
Volume 4
River Dolphins and the Larger Toothed Whales

Edited by **S. H. Ridgeway, R. Harrison,**

March 1989, 464 pages, £49.50

ISBN: 0.12.588504.0

This series is an authoritative guide to the biology of marine mammals in their natural environment. Perfect for use in the field as a practical guide to identification, these books provide an abundance of factual information and reference photographs.

New Introductory Text!

MOLECULAR ENDOCRINOLOGY

F. E. Bolander

March 1989, 279 pages, £25.00

ISBN: 0.12.111230.6

This is the first textbook on the major molecular mechanisms of hormone action. Written for beginning graduate students, **Molecular Endocrinology** will also be a useful reference for professionals in related fields. The text provides a solid background in the basics of molecular endocrinology and concentrates on the molecular aspects of hormone function. Also included are useful techniques and discussions of their advantages, disadvantages, and applicability.

Contents: Introduction. General Endocrinology. Kinetics. Nuclear Receptors. Membrane Receptors. Receptor Regulation. Cyclic Nucleotides. Calcium, Calmodulin and Phospholipids. Miscellaneous Second Messengers. Non-transcriptional Effects of Hormones. Transcriptional Regulation. Histone and Non-histone Protein Modifications. Post-transcriptional Control. Molecular Evolution of the Endocrine System. Hormones and Oncogenes. Molecular Bases of Endocrinopathies.

INSECT-FUNGUS INTERACTIONS
14th Symposium of the Royal Entomological Society of London in Collaboration with the British Mycological Society

Edited by **N. Wilding, M. Collins, P. M. Hammond**

November 1988, 360 pages, £33.00

ISBN: 0.12.751800.2

The first and only book to summarize this fascinating topic, this symposium volume reviews the current state of knowledge in four principal areas: mycophagy, mutualism, insect spread of plant fungal disease, and insect mycopathology.

CURRENT ADVANCES IN IMMUNOLOGY

Current Advances in Immunology is one of twelve journals produced from the *Current Awareness in Biological Sciences* (CABS) Database. CABS provides the working biologist with a contents service which is fast, economical and easy to use. Specialised subject editors scan over 3500 international journals, classify the articles and add them to the database in a simple and user-friendly format, giving complete details of title, authors and authors' addresses, and bibliographic information.

- ❒ **Clear format enabling speedy use**
- ❒ **Comprehensive coverage allowing user to make own judgements**
- ❒ **Unlimited cross-referencing**
- ❒ **Full address with each author making it easy to write for reprints**
- ❒ **Timesaving breakdown into detailed classification scheme**
- ❒ **Up-to-date — 4-6 weeks publication**
- ❒ **Also available online**

Annual subscription, 12 issues, starting in any month
only £27.00 / US$43.00 / DM80.00

Subscription information applies to individuals only and is subject to change without prior notice. Remittance to be included with order. Institutional rates available on request.

Space Telescope ready at last

The long delay in launching the Hubble Space Telescope, caused by the Challenger disaster, has given the Space Telescope Science Institute time to develop strategy, and to win the respect of the community.

Baltimore

WHEN the Hubble Space Telescope (HST) is finally launched, maybe in December, the most sophisticated automatic telescope yet built will be in a 90-minute orbit 300 miles above the Earth, but its users will be left firmly on the ground. The Space Telescope Science Institute (STScI) here will be the nearest they can get to it, which may be regarded as a way of carrying to its extreme the growing belief among those who operate major telescopes that the presence of live astronomers is often an inconvenience, sometimes even a hazard.

As at observatories everywhere, users will submit proposals which will be assessed for scientific merit and their particular suitability for the instrument they intend to use. Successful proposals will be worked up in detail, with the help of staff astronomers at the STScI, and interleaved with all the other successful proposals to make the most efficient use of available observing time and instrumentation.

But HST has to fulfil expectations beyond the relatively straightforward hopes of scientists: it (or more particularly the people who operate it) must prove that the money and anxiety spent on it, especially during the enforced hiatus caused by the Challenger disaster, have not been in vain. The US Congress, and US taxpayers generally, will be looking eagerly over the users' shoulders for surprises and novelties. Some astronomers may regard this element of showmanship as an intrusion; fortunately, the director of STScI, Riccardo Giacconi, is not one of them. But what spectacles to provide?

The charter of STScI contains the useful provision that its purpose is to "conduct" an observing programme on the Space Telescope. This gives the director the freedom to act either as the passive arbitrator of proposals or as the dictator of what observations should be made. The more pharaonic extreme will be valuable in the early days.

Even if the Space Telescope is launched as intended during December this year (and difficulties with the imminent launch of Discovery cast some doubt on this), it will not be ready to spring instantly to life. The first six months have been allocated to commissioning the telescope and its various instruments. This period can be stretched by one more month, but after that STScI intends to gain control of the Space Telescope because, as one astronomer said, the engineers would carry on commissioning the instrument for the whole of its fifteen-year lifetime, given the chance.

During commissioning, trial observations will be made with the telescope's six instruments (two cameras, two spectrographs, a photometer and a fine-guidance system for astrometry). Some data and images will therefore be coming down to Earth before observations officially begin. Will these do for Congress?

STScI is working under a written obligation from NASA that any such 'first light' images used for promotional or other purposes must specifically not have any scientific interest. The supposed danger is that if, for example, *Nature* were to publish on its cover sometime next January an unprecedentedly fine picture of a nearby globular cluster, in which the central stars could be made out individually instead of blurring together, then eager astronomers around the world would get out their plastic rulers and start counting stars, uncovering long-held secrets about the internal dynamics of dense stellar systems and depriving whichever group of astronomers had the first proposal to do the same thing of their chance for glory. STScI is thus faced with the task of producing first images which are both spectacular and uninteresting, a riddle not yet solved.

Once the observing programme begins in earnest, scheduling tactics will be more conventional, but some special difficulties remain. For the Space Telescope, the cycle of day and night is replaced by the 90-minute orbital period, and although an object near the North or South pole can be observed continuously, those parts of the sky are generally empty of interesting objects: the galactic plane is close to the plane of the Solar System and the Earth's Equator, which means that most observing will have to be done in the 45-minute portions of time when the Earth is not in the way. On top of that, the Space Telescope must not be allowed to point at the Moon or the Sun, which would be fatal to some of the instrumentation.

The speed of the orbit combined with the telescope's lack of speed in slewing across the sky (its direction can be changed only a little faster than the minute hand moves on a clock) combine to make efficient scheduling difficult. During the launch delay, STScI has developed scheduling algorithms to maximize the time that observations are being made.

Switching from one instrument to another is a headache, involving as it does choosing between six detectors, selecting one of about fifty filters, changing filters and detectors during an observing run, and perhaps running two instruments simultaneously. STScI will be pleased to be making observations one-third of the time.

Deciding what observations to make is the final part of STScI's strategic puzzle. Ultimately, one of the Space Telescope's greatest virtues may lie in its ability to perform long-term projects, such as dissecting and cataloguing distant clusters of galaxies or searching for infrared emission from nearby subdwarf stars.

The deadline for the first round of proposals passed last October, and almost 600 proposals from 1,500 astronomers in 30 countries have been received. About 15 per cent of the observing time is guaranteed to investigators from the European Space Agency, which has provided the Faint Object Camera and the solar panels for HST, but the 15 per cent target is intended only as a long-term average, and there will be no lawsuits if the proportion during the first year or so is a little amiss.

Observing time is oversubscribed by about seven to one for this first period, which has allowed Giacconi and his staff to exercise their discretionary powers to slant observations in chosen directions without sacrificing quality. Many of the programmes that STScI favours are of cosmological importance: finding Cepheid variable stars at the distance of the Virgo cluster of galaxies, for example, would bypass several rungs of the cosmological distance ladder and could at a stroke reduce our ignorance of the Hubble constant and the age of the Universe.

Giacconi has understood from the outset that the ability of STScI to impose, to some extent, its designs on the rest of the astronomical community depends on the standing of his institute. STScI scientists win about 20 per cent of the observing time at Kitt Peak National Observatory.

It is a trite comment now that the years of delay to HST's launch have been beneficial, allowing the instruments to be improved, a satisfactory number of guide stars to be catalogued, and scheduling problems to be overcome. But more important is that the delay has allowed STScI to become an astronomical institution of the first rank whereas, had HST been launched on time, it might have been merely a service station. **David Lindley**

HUMAN IMMUNODEFICIENCY VIRUS

Revving up gene expression

Michael R. Green and Maria L. Zapp

THE expression of eukaryotic protein-coding genes can be regulated at a variety of levels from transcription to translation. It has been largely assumed, however, that the transport of the fully processed messenger RNA from the nucleus to the cytoplasm (mRNA nuclear export) is a constitutive step. Studies of the human immunodeficiency virus (HIV) reported by Malim *et al.* on page 254 of this issue[1] suggest that this assumption is no longer tenable, and may stimulate the quest for cellular proteins that regulate the export of RNAs from the nucleus.

All replication-competent retroviruses, including HIV and the somewhat similar human T-cell leukaemia virus (HTLV-I), have three essential structural proteins: the group-specific antigen, the envelope protein, and the reverse transcriptase, encoded respectively by the *gag*, *env* and *pol* genes. HIV and HTLV-I are, however, souped-up retroviruses, which also encode unique proteins that regulate viral gene expression. Two HIV regulatory proteins are encoded by the *tat* and *rev* genes, and the corresponding HTLV-I proteins by the *tax* and *rex* genes[2] (see Fig. 1).

The HIV Tat and HTLV-I Tax proteins act at the transcriptional level to increase synthesis of both the structural and regulatory viral proteins. The HIV Rev and HTLV-I Rex proteins, however, selectively increase the synthesis of the structural proteins later in infection, thereby maximizing the production of viral particles. The basis for this selective action lies in a second unique feature of HIV and HTLV-I: both viral genomes contain at *least* two introns. Both introns are present in the *gag–pol* mRNA, whereas one intron is removed to produce the *env* mRNA, and both are spliced out of the mRNA(s) encoding the regulatory proteins (Fig. 1).

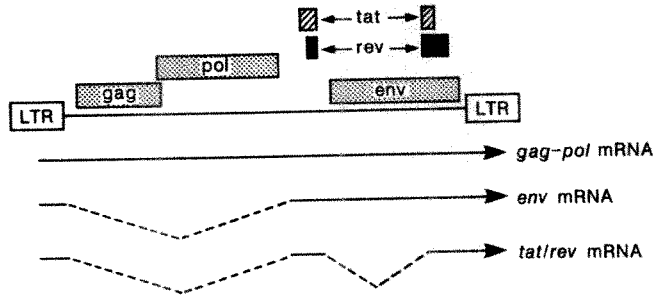

FIG. 1 A simplified version of HIV gene expression. The regulatory proteins of HIV (and HTLV-I) are expressed from largely overlapping reading frames. The HIV proviral genome is shown bracketed by the two LTRs. The viral protein-coding regions are shown above. A schematic representation of the splicing patterns of the viral mRNAs is shown below. Exons, solid lines; introns, dashed lines.

Rev and Rex augment the production of viral structural polypeptides by increasing the cytoplasmic concentration of the intron-containing *env* and *gag–pol* mRNAs. One way Rev and Rex could effect this increase is by specifically inhibiting splicing. This would raise the amount of unspliced *gag–pol* mRNA and singly spliced *env* mRNA at the expense of the *tat/rev* mRNA, whose production requires two splicing events. Alternatively, Rev and Rex could act by specifically accelerating the nuclear export of the *env* and *gag–pol* mRNAs. (These two possibilities are not mutually exclusive as accelerated nuclear export is itself a mechanism for inhibiting splicing, a point we shall return to.)

Malim *et al.*[1] present three lines of evidence, which together argue that Rev does not directly inhibit splicing. The first set of experiments asks what is the RNA sequence(s) required for the effect of Rev (Rev-responsive region; RRE)? The existence of an RRE is implied by the fact that the viral *env* mRNA, but not a cellular mRNA presursor (pre-mRNA) such as insulin, is responsive to Rev. To test whether the RRE corresponds to a viral splicing signal, chimaeric genes were constructed in which each of the known splicing signals of the viral *env* RNA was replaced by the equivalent insulin pre-mRNA signal. All of the chimaeric pre-mRNAs were still responsive to Rev, indicating that no viral splicing signal is uniquely required for Rev action. Next, Malim *et al.* mapped the RRE to a portion of the *env* coding sequence that is spliced out of the *tat/rev* mRNA (intron 2), and showed that it functions following translocation to several positions within intron 2, and even when moved to the exon. The ability of the RRE to work independently of its position within the RNA, and particularly within the exon, makes it unlikely that Rev acts at the level of splicing.

In a second set of experiments, Malim *et al.* measured the ratio of unspliced-to-spliced *env* RNA in nuclei and cytoplasm. If Rev directly inhibits splicing, the increased ratio of unspliced-to-spliced *env* RNA in the cytoplasm should be paralleled in the nucleus. However, Rev has little effect on the ratio of unspliced-to-spliced *env* RNA in the nucleus, arguing that Rev does not directly affect either splicing or nuclear stability. (Note, however, that this conclusion relies upon assumptions regarding the rate-limiting step in splicing, and cytoplasmic mRNA production, and potential inter-relationships between splicing and export; see below.) Finally, Malim *et al.* tested the splicing inhibition model by asking whether Rev can act on a pre-mRNA rendered unsplicable by removal of the 5′ splice site. They find that Rev increases the cytoplasmic concentration of this unsplicable RNA, a result more compatible with the nuclear export model than the splicing inhibition model.

Comparable experiments have not yet been performed with the HTLV-I Rex protein, but it is probable that Rev and Rex act similarly. The HTLV-I Rex protein can functionally substitute for the HIV Rev protein[3], an intriguing observation in the light of the fact that these two proteins lack amino-acid similarity.

Although Rev may not directly inhibit splicing, by accelerating nuclear export Rev inhibits splicing indirectly: export separates the pre-mRNA from the nuclear-localized splicing factors. Splicing occurs in the nucleus following assembly of the pre-mRNA into a large complex, the spliceosome, which contains multiple small nuclear ribonucleoproteins (snRNPs). The spliceosome may also serve to retain RNAs in the nucleus by, for example, preventing the RNA from productively interacting with the nuclear pore, the normal avenue of egress[4,5]. In this sense, spliceosome assembly and nuclear export are competing processes (Fig. 2), a notion supported by recent experiments in yeast in which mutations that prevented spliceosome assembly facilitated nuclear export[6].

Upon splicing, the mRNA is released from the spliceosome, which remains primarily associated with the intron. The mRNA, but not the excised intron, is then free to be exported. This 'spliceosome-retention' model can explain the selectivity of RNA export: for a typical cellular pre-mRNA, the spliced mRNA product is exported, whereas the unspliced pre-mRNA and the other product of the splicing reaction, the excised intron, are retained in the nucleus.

Retroviral pre-mRNAs are spliced notoriously inefficiently, perhaps because of specific inhibitory *cis*-acting elements[7,8]. This inefficiency is probably critical to the

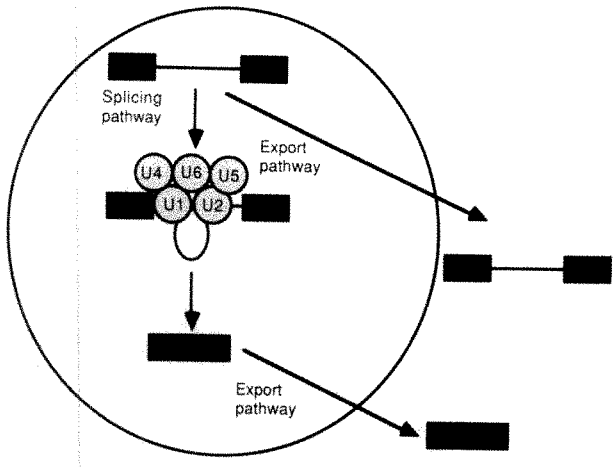

FIG. 2 Splicing and export pathways in the eukaryotic cell nucleus, showing potential processing pathways for a pre-mRNA in the nucleus. The pre-mRNA is shown with boxes representing exons, and lines representing the intron. In a splicing pathway, the pre-mRNA is assembled into a spliceosome. In the spliceosomal complex, U1, U2, U4, U5 and U6 snRNPs are shown as circles. Some of the snRNP–snRNP contacts in the spliceosomal complex are arbitrarily drawn.

propagation of the virus, because incompletely spliced and unspliced RNAs are required to encode structural proteins and to serve as genomic RNA. Conceivably, Rev may be able to work only upon inefficiently spliced pre-mRNAs. For example, Rev may act before spliceosome assembly, and efficiently spliced pre-mRNAs are probably assembled rapidly into spliceosomes. In fact, electron microscopy has shown that the spliceosome assembles immediately on the nascent transcripts of some cellular genes[9].

A more detailed understanding of the mechanism of Rev (and presumably Rex) may be hampered by our limited knowledge of mRNA nuclear export. For example, we do not even know whether mRNAs require a specific export signal, or whether, if not encumbered by a spliceosome, they are exported by default. The existence of single-base substitutions that can prevent export of transfer RNAs[10-12], argues that at least some RNAs harbour specific export signals.

How might Rev accelerate the rate of export? Recent immunofluorescence experiments may provide a clue. Surprisingly, the HTLV-I Rex protein is localized in the nucleolus rather than the nucleoplasm or nuclear envelope[13], perhaps implicating the nucleolus or a nucleolar constituent in mRNA nuclear export.

Although Rev might just be a quirk of HIV, studies of eukaryotic viruses have often provided the first glimpses into cellular regulatory mechanisms. If history repeats itself, Rev and Rex are the harbingers of cellular regulatory proteins waiting to be discovered. □

MATERIALS SCIENCE

Fractal dimension and fracture

Robert W. Cahn

How rough is a fracture surface? This question is in the domain of the craft of fractography, which seeks to elucidate the mechanisms of fracture by studying the topography of a broken object. Somewhat akin to phrenology, some sceptics might say. Nevertheless, in two new studies, Mecholsky, with Mackin[1] and with Passoja and Feinberg-Ringel[2], shows that it may be possible to scale the fracture toughness of fairly brittle materials by just such an exercise in fractographic analysis, exploiting the concept of fractals.

Fractals were invented — or at any rate clearly formalized — by Mandelbrot[3,4]. The term refers to any boundary or surface which remains self-similar as the scale of examination is magnified. Figure 1 gives an example of such a boundary. For this shape, a 'Koch island', drawn to be always of constant area, the length of the perimeter is increased by a factor of 1.5 from one drawing to the next, if the length of the ruler unit used to measure it is decreased by half, and the image resolution grows by a factor of four. If the logarithm of the total perimeter length is plotted against the logarithm of the length of the ruler unit (the resolution), a straight line or 'Richardson plot' is obtained, the slope of which was treated by Mandelbrot as a fractional, fractal, dimension: for a boundary as in Fig. 1, this dimension is between 1 and 2 — in this case, 1.5.

Similarly, a rough surface which is self-similar has a dimension between 2 and 3. To obtain this fractal dimension, it is usual either to make serial sections perpendicular to the surface ('vertical' sections) and examine the shape of the section boundary, or to section parallel to the surface and examine the perimeters of the 'islands' and 'lakes' which are in effect contours of such 'horizontal' sections.

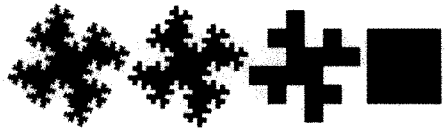

FIG. 1 A Koch island with a perimeter of fractal dimension 1.5 (from ref. 5).

The original concept of fractals was restricted to self-similar outlines only, but more recently the concept has been extended to more ordinary boundaries and surfaces of varying roughness; thus, Fig. 2 shows four outlines generated by Russ[5] by a rather involved computer algorithm, with four different fractal dimensions. In such cases, the corresponding Richardson plot has a straight central part with curved regions at either end. (Such shapes should really be called 'pseudo-fractals', but that term does not appear to have been used.) Stereologists still disagree about the appositeness of the horizontal section approach[6], but in a recent study of fracture surfaces of ceramics, Mecholsky and Passoja[7] found that the horizontal and vertical methods gave closely similar fractal dimensions.

The studies of Mecholsky and colleagues[1,2,7] on the relation between fractals and fracture were stimulated by two apparently independent initiatives. One was a fractographic study by Mandelbrot *et al.*[8] of broken specimens of maraging steel. The impact toughness of 300-grade maraging steel in various states of heat-treatment increases steadily as the fractal dimension of the fracture surface decreases towards 2 (it becomes steadily smoother)[8]. It is apposite that Mandelbrot should have been involved in this early study because, as he says, he coined the term fractal "in explicit cognizance of the fact that the irregularities found in fractal sets are often strikingly reminiscent of fracture surfaces in metals (though not, for example, in glass)". Although he does not say so, one should not lose sight of the fact that the word fraction has the same Latin root as fracture, and fractals have fractional dimensions.

The second study was by Beauchamp and Purdy[9], who examined the changes in fracture toughness and fracture morphology of chert (flint) as it is heat-treated at progressively higher temperatures. It turns out that chert heated to 500 °C is considerably less tough than untreated material; the heated chert also has a much smoother surface. (This implies that heated chert is easier to chip and shape into tools, and indeed there is archaeological evidence that chert was commonly heated in prehistoric times.) Heating coarsens the exceedingly fine grain of the chert and also apparently enhances the strength of the intergranular bond: unheated chert fractures along the boundaries of the fine grains, heated chert breaks transgranularly. But the unheated material is nevertheless tougher because fracture is constrained to follow a very tortuous path.

Beauchamp and Purdy did not explicitly invoke the fractal concept in their study,

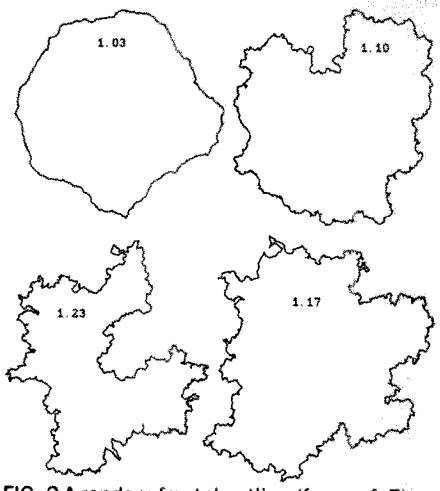

FIG. 2 A random fractal outline (from ref. 5).

but in the new work[1,2] by Mecholsky and co-workers, their original samples are subjected to a proper fractal analysis, using both horizonal and vertical methods of analysis. It is quite clear that the fracture toughness, K_c, of chert increases as the fractal dimension increases — as the fracture surface becomes rougher. This is the exact converse of what was found for maraging steel. (The relationship for chert is in the form of a linear log–log plot of K_c against fractal dimension.)

The authors also indicate, by means of a figure relating the fractal dimension of the fracture surface to fracture toughness for several ceramics (oxides, silicates, chalcogenides) that this form of relationship is universal for such highly brittle materials, though the results bunch into several distinct material groups rather than falling along a single master line. This research is itself a continuation of earlier work[7].

We thus have the intriguing fact that the relationship between fracture roughness (fractal dimension) and fracture toughness is diametrically opposite for ductile fracture (maraging steel) and for brittle fracture (chert and polycrystalline ceramics). For chert, where fracture is governed by the spreading of cracks, the toughening influence of factors making for rough fractures has been qualitatively explained. For ductile fracture, which can take place by the progressive creation, growth and merging of minute voids, the relationship is clearly different. Mandelbrot *et al.*[8] seek to interpret their findings in terms of percolation concepts applied to the filaments remaining intact between voids, but it must be said that their argument is not easy to follow. It is to be hoped that in future work, Mecholsky and colleagues will address the piquant distinctions between ductile and brittle fracture which these studies have uncovered. □

MICROBIOLOGY

Bacteria that thrive in toluene

Howard Goldfine

TOLUENE is widely used in the laboratory to permeabilize and kill bacteria. Thus, the isolation of a bacterial strain described by Inoue and Horikoshi on page 264 of this issue[1], which not only resists the toxic actions of toluene, but grows luxuriantly in the presence of emulsions containing up to 50 per cent of this solvent, represents a significant achievement. In a rich medium, Inoue and Horikoshi find that growth in the presence of toluene is about two-thirds as rapid as that obtained in its absence. It should, however, immediately be noted that the newly isolated strain only tolerates toluene rather than using it as an energy source.

The organism, identified as a strain of the gram-negative aerobe *Pseudomonas putida*, an organism known for its protean degradative capabilities, was isolated after screening 750 soil samples collected in Japan. The only hint concerning the site of its isolation is that the soil was obtained from Kyushu, Japan's large southern island. It is not clear whether these soils are contaminated with organic solvents.

The isolation of organisms resistant to aromatic hydrocarbons and other industrial products has implications for biodegradation and biotransformation. The annual global production of benzene and toluene each exceeded 10^9 gallons in 1980, and these materials are likely to be found in soils and sediments[2]. The availability of organisms that can withstand the toxic effects of these organic solvents and participate in their degradation or transformation is clearly desirable. *P. putida* contains chromosomal genes encoding the enzymes involved in the degradation of aromatic compounds by the so-called ortho cleavage pathway, and strains have been isolated that contain the common TOL plasmids encoding the genes for the enzymes of the catechol meta cleavage pathway[3]. It would seem to be just a short step to bring together these degradative resistance characteristics. The isolated strain is also resistant to styrene, *p*-xylene, ethylbenzene, cyclohexane, *o*-dichlorobenzene, propylbenzene and various alkanes up to isooctane, thus there is wide scope for producing both solvent-tolerant and solvent-degrading strains. The marriage of these two desirable traits may be less than harmonious, however. The alterations in the cells of the toluene tolerant strain that make growth in solvents possible could shield the cell from these solvents so perfectly that little penetration to the locations of degradative enzymes would be possible.

The authors of the paper in this issue, one of whom is a member of the Superbugs Project of the Research Development Corporation of Japan, have begun a genetic analysis of the solvent resistance of *P. putida*. They have isolated a series of mutants of their new strain that are not resistant to toluene, but retain resistance to solvents of lower polarity in the order toluene > *p*-xylene > cyclohexane > hexane.

By examining the partitioning index of these and other substances in a standard octanol:water mixture, they can predict accurately the resistance of these mutant strains to other compounds in the polarity scale. In addition to mutant strains of *P. putida*, they can order other microorganisms in a similar hierarchy of solvent-tolerance, in which growth in a solvent of a given polarity indicates tolerance to solvents of lower polarity. Genetic analysis combined with biochemical and morphological studies should provide useful insights into the nature of solvent tolerance in these bacteria.

The outer membrane of gram-negative bacteria is important in determining the penetration of hydrophobic molecules through cell membranes, and consequently in determining the resistance of these bacteria to dyes, detergents, bile salts and hydrophobic antibiotics. Mutations in the structure of the lipopolysaccharide of the outer membrane can profoundly affect permeability of these molecules, but these effects are complicated by concomitant changes in the amounts of specialized pore-forming, outer-membrane proteins[4]. Studies of the outer membranes of these solvent-resistant strains of *P. putida* may be rewarding.

CELL MOTILITY

Networks from mutants

Dennis Bray and Juri Vasiliev

THOSE of us who earn a living from the cytoskeleton feel a little threatened. We had always asserted (rather too dogmatically, as it now seems) that actin and actin-binding proteins were the motor by which animal cells crawl from one location to another. And yet André *et al.* now describe in the current issue of the *Journal of Cell Biology*[1] the third mutant strain of *Dictyostelium* which lacks a major actin-binding protein and nevertheless shows normal motility and chemotaxis. The ground begins to shake beneath our feet! Could it be that, like those primitive people who believed that when the wind blows it is because the trees are stirring the air, we have the wrong end of the stick? Is it possible that cell locomotion is driven not by the cytoskeleton but by lipids, or something equally improbable?

The amoeboid form of *Dictyostelium discoideum* crawls in a very similar fashion to other animal cells and also shows a chemotactic response to distant sources of cyclic AMP. Unlike neutrophils and fibroblasts, however, these cells are haploid and therefore particularly suitable for genetic manipulation. Gerisch and his colleagues[2] at the Max Planck Institute in Martinsried in 1986 took advantage of this combination of virtues by isolating a mutant deficient in the actin crosslinking protein α-actinin. The group's more recent study[3] of this mutant, using four monoclonal antibodies, confirms that α-actinin is almost completely absent; nevertheless, the mutant's movements, chemotaxis and ability to 'cap' and 'patch' surface proteins are unimpaired.

An indication that this might be a general phenomenon came in two papers[4,5] published in the same issue of *Science* last year describing life without myosin. As related in a News and Views article at the time[6], strains of *D. discoideum* were generated that lacked normal high-molecular-weight myosin (myosin-2). In one case, expression of the myosin gene was severely depressed through the introduction of antisense RNA; in the other, homologous recombination was used to substitute a myosin lacking most of its tail for the normal myosin. It is something of a relief to relate that these myosin-less cells are not entirely normal: they have an altered morphology and are severely defective in their ability to carry out cytokinesis. But they can crawl and they can direct their locomotion up a gradient of cyclic AMP.

The point has now been driven home in the new work of Gerisch's group[1], in which André *et al.* describe a mutant strain of *Dictyostelium* lacking severin — an actin-filament fragmenting protein related to gelsolin and villin. The cells grow at the usual rate, forming normal fruiting bodies and viable spores. By many criteria, such as speed of movement, rate of turning and precision of chemotactic orientation, their motility is unimpaired.

A literal interpretation of these findings, based on conventional genetic arguments, would be that α-actinin, myosin and severin are not involved in cell locomotion. But this conclusion is at variance with much circumstantial evidence linking actin-based systems to the generation of motile structures in the cell. An alternative explanation is that these proteins could be involved in cell locomotion but their function could be duplicated or 'guaranteed' (as Schleicher *et al.* put it[3]) by more than a single protein. There is indeed substantial overlap in the activity of actin-binding proteins *in vitro* and more than one way to crosslink, fragment or even to move actin filaments. But why should there be such extensive 'fail-safe' guarantees for cell locomotion when other, more essential cellular functions such as DNA synthesis are not thus underwritten?

The explanation that we favour — which, if correct, has implications that extend beyond the area of cell motility — is that actin-based motility has some of the properties of the parallel distributed processes used in artificial intelligence (see Anderson's News and Views article[7]).

That is, at every stage between the detection of environmental cues by receptors on the cell surface to the generation of cell movement, there is extensive overlapping redundancy. Cell surface receptors change the levels of second messengers such as calcium ions and phosphatidyl inositol bisphosphate; second messengers influence the activity of actin-binding proteins, either directly or through protein kinases. At each successive stage, the 'signal' generated by a specific agonist becomes distributed more widely; it spreads down parallel pathways and converges with various combinations of signals from other receptors on to different target proteins.

The ten or more actin-binding proteins in a cell would form one layer of this net-

Paternity of dunnocks by DNA fingerprinting

W. B. Carr

THE hedge sparrow or dunnock (*Prunella modularis*) is a small, insect-feeding passerine bird belonging to the accentor family. It is common throughout the British Isles, inhabiting bushy places where nesting sites are plentiful and is a common sight in suburban parks and gardens. The species is unusual in having a variable mating system, a fact which has attracted considerable attention from behavioural ecologists. Mating may involve monogamy (one male, one female), polygyny (a male with two females), co-operative polyandry, where two males mate with a single female and may help to feed her young, and polygynandry, where two males share two or more females. On page 249 of this issue, T. Burke and collaborators report the successful application of the technique of DNA fingerprinting to link observations of mating behaviour and parental care of dunnocks in a well-studied population in a botanical garden in Cambridge, UK with precise measurements of reproductive success. They conclude that males do not discriminate between their own young and those of another male in multiply-sired broods, but feed offspring in relation to their access to the female during the mating period, which is a good predictor of paternity. Rory Howlett

in a set of different motile structures, each of which contains other proteins that perform similar functions. In this view, cell locomotion depends on the combined activities of actin-binding proteins as a whole (if Gerisch and his colleagues mutate all actin-binding proteins, the cell would grind to a halt). But it is a corporate exercise in which individual proteins have a range of functions that overlap the functions of other proteins. Removal of a single protein by mutation will not have a single identifiable phenotype but cause a 'graceful degradation' (a term used in parallel distributed processing) over a range of motile functions.

The analogy with parallel distributed processing networks may seem far-fetched, but it is no more than a recognition of the extensive interconnection in cell signals that is known to exist. The consequences of such overlaps have, simply, been most thoroughly explored in the case of computer networks used to simulate cognitive functions[8].

One important feature that has been found in such networks is that they are resistant to damage: as already mentioned, this feature is shared by the machinery of cell movement. Another is that individual units within the network come to represent regularities in the input: we might suppose, for example, that a rise in activity of a particular protein kinase represents all those sets of environmental conditions that signify 'round up' or 'divide'. Third, and of greater significance to evolution, is that parallel distributed networks are highly flexible in performance. Each type of cell movement could be driven by a specific 'blend' of actin-binding proteins ("take three ounces of actin; add three cups of filamin and two of severin; mix with a tablespoon of myosin and stir. . ."). And there are many more possible combinations of actin-binding proteins than there are individual proteins: an argument familiar to developmental biologists. □

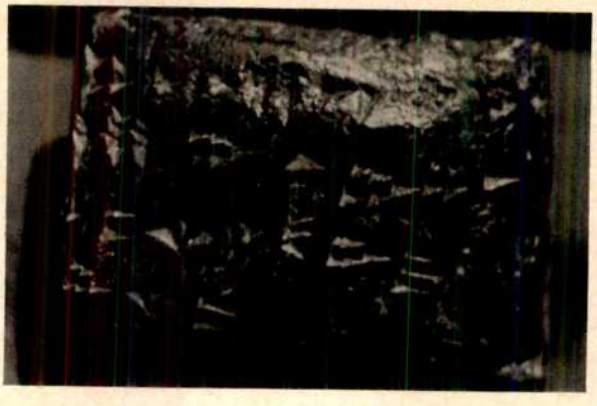
ARCHAEOASTRONOMY

Eclipse seen at ancient Ugarit

Christopher B. F. Walker

THE engraved tablet shown below is the only record of an arguably astronomical nature from the second millennium BC apart from those of Babylonia. Recovered from the site of Ugarit, an ancient city on the Mediterranean coast of Syria, it has been interpreted by Sawyer and Stephenson[1,2] as a report of a solar eclipse. On page 238 of this issue[3], de Jong and van Soldt deduce a new dating of this eclipse, to 1223 BC, basing their argument on archaeological considerations and a reassessment of the text. Their new dating is of great interest to those trying to calculate the change in speed of the Earth's rotation, but is inevitably speculative.



The publication and study of ancient and mediaeval astronomical records in recent decades has considerably increased the time base over which astronomical phenomena can be considered. The records contain references to eclipses, occultations, comets, sunspots and supernovae[4]. Babylonian[5] and Chinese[6] records have lately contributed to the study of the history of Halley's comet. The Babylonian 'astronomical diaries' from the period 400–50 BC[7] also contain records of market prices and weather reports which may eventually be useful for the reconstruction of economic and climatic patterns. Usable data of the same type from earlier than the seventh century BC are very rare.

The most important single group of observations has been those of the first and last visibility of Venus recorded during the reign of the Babylonian king Ammisaduqa (1702–1682 BC). Reconsideration of these in the light of later Babylonian data on the *arcus visionis* of the planet have led to a revision of the calculated date of the observations and consequently of the whole chronology of the Old Babylonian period[8]. The Ugaritic tablet is the only other arguably datable astronomical observation outside Babylonia from the second millennium BC.

In assessing the strength of the claims made[1–3] for the Ugaritic tablet, one must take into account the fact that this is, if correctly identified, the sole surviving astronomical observation written in the Ugaritic language. The only related material preserved in the palace archives of Ugarit are two fragments described as almanacs and an astrological text. Whereas Babylonian astronomical terminology, including the terminology of eclipses, is well known, we have no information on Ugaritic terminology. At first sight the text refers to an event occurring at sunset. Its interpretation as a non-technical description of a solar eclipse was suggested by Sawyer and Stephenson[1,2] on the basis of similar circumlocutory descriptions of eclipses ranging from China in the thirteenth century BC to Germany in the twelfth century AD. Corroboration of the interpretation depends on the planetary and calendrical evidence.

The identification of the Ugaritic god's name Rŝp with Mars and the proximity of Mars to the eclipsed Sun are critical to de Jong and van Soldt's analysis. The Ugaritic names for the planets are otherwise unknown, and the identification depends on the twice-attested equation of Rŝp with the Mesopotamian god Nergal and on a single Assyrian astrological omen text of the seventh century BC in which Mars, elsewhere always named Salbatanu, is unusually given the name Nergal. The normal usage in Mesopotamia was to give the specific names of the planets in observational references, and to introduce the names of associated deities only in astrological explanations. The use of the name Rŝp in the Ugaritic text would contrast with this pattern.

As de Jong and van Soldt make clear, their interpretation of the text as an eclipse report is also dependent on the assumption that a calendar of Egyptian

Mission Archeologique de Ras Shamra/Ugarit

Obverse side of the Ugaritic tablet KTU 1.78, presently in the Museum of Antiquities in Damascus. Arguably this describes a solar eclipse, dated by de Jong and van Soldt in this issue[3] to have occurred in 1223 BC. (Courtesy of D. Pardee.)

type was in use. Until now there has been nothing to demonstrate whether Ugarit followed the Egyptian or the Babylonian pattern. Thus the present assumption, while perfectly plausible, will remain speculative until supporting evidence becomes available.

Given the paucity of contemporary material it is perhaps unlikely that we will ever find more explicit astronomical reports from Ugarit, and we have to make the best use of what we have. De Jong and van Soldt's work is certainly an advance on the earlier discussion. But the limitations of the evidence are such that at present their interpretation can best be regarded as a plausible hypothesis. To an Assyriologist it would seem to be a precarious basis for scientific arguments. □

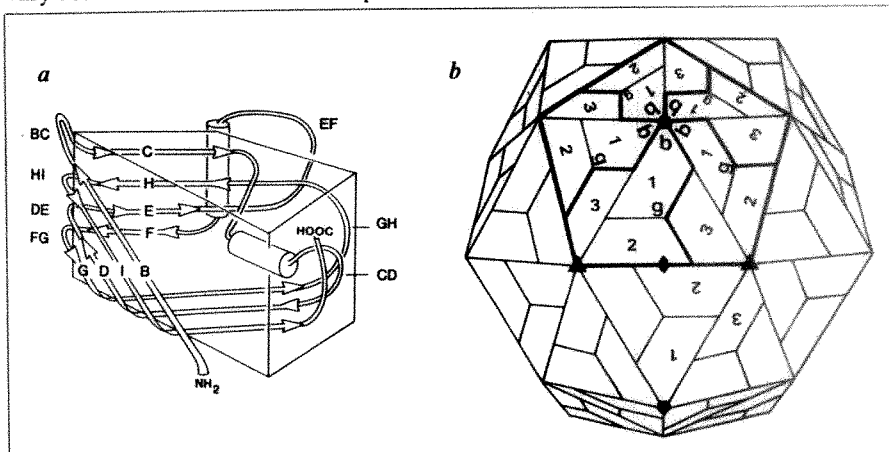
PICORNAVIRUSES

Finding the receptors

Stephen C. Harrison



NEW insights and new puzzles about how RNA viruses recognize their receptors arise from the structure of foot-and-mouth disease virus, published three weeks ago in *Nature*[1], and from the identification of the receptors for human rhinoviruses and for poliovirus, reported this month in *Cell*[2-4]. The structure of the foot-and-mouth disease virus also provides a plausible explanation for the efficacy of a particular peptide vaccine.

Like other picornaviruses, foot-and-mouth disease virus (FMDV) is composed of 60 copies each of four polypeptides (VP1–4), arranged with icosahedral symmetry. Although not obviously related in sequence, VP1, 2 and 3 have similar folded structures, based on an eight-stranded β-barrel that I have elsewhere[5] proposed be called an RVC domain (for RNA virus capsid, where it was discovered) — see figure. The β-sheet framework is similar in the three subunits, but the loops and amino- and carboxy-terminal extensions vary considerably. VP4 is, in effect, part of the amino-terminal extension of VP2, from which it is cleaved during assembly. The human rhinovirus 14 (HRV14)[6] and poliovirus[7] structures show that the loops between framework elements dominate the surface of the virus and provide the important antigenic determinants.

In HRV14 and in poliovirus, VP1 contains particularly prominent BC and GH loops at opposite ends of the wedge-like barrel. These loops create a concave surface, and the packing of five copies of VP1 around the 5-fold symmetry axis means that these concavities join to form a roughly circular groove (see figure caption). This feature in HRV14 has been called the 'canyon' by Rossmann and colleagues[6]. These authors proposed that it might be the locus of receptor binding and noted that it would be inaccessible to antibodies. Colonno and colleagues have obtained evidence that the HRV14 canyon is its receptor site, by generation of site-directed mutants in infectious complementary DNA clones[8].

Several viruses show antigenic variation that permits escape from neutralization by antibodies present in a host previously exposed to a parent strain. Conserved receptor sites cannot undergo this variation. Must they be inaccessible to avoid neutralization by antibodies against their conserved structure? Colman has observed that a conserved receptor site need not compromise potential escape mutants, provided that the site is smaller than the typical 'footprint' of an antibody[9]. Variation at the periphery of the site can prevent neutralization without interfering with receptor interactions. Indeed, the influenza virus receptor site is a small, sialic acid-binding pocket of conserved amino acids surrounded by residues that vary between recurrent influenza epidemics[10]. The FMDV structure seems to show another kind of attachment site with similar properties. Several lines of evidence point to participation of the GH loop of VP1 in receptor binding[1,11]. Relatively short peptides with sequences from this loop block attachment of virus to cells[11]. They contain an evolutionarily conserved Arg-Gly-Asp sequence, which is surrounded by residues that vary from strain to strain. Not only does the GH loop project from the viral surface, it is also sufficiently disordered that it does not appear in the electron-density map. Thus, the presumed binding site in FMDV appears to be prominent, not recessed, but it is smaller than an immunoglobulin 'footprint' and embedded in a variable surround.

Potent vaccines can be made from peptides having sequences in the disordered GH loop of VP1[12]. The unusual success of these peptide vaccines can probably now be explained. Like a peptide in solution, the loop has no unique, folded conformation. A given antibody molecule that has been raised against a peptide antigen will be complementary to that peptide in a particular conformation. The corresponding sequence in the flexible loop can adopt the required conformation with little cost in free energy. Moreover, if different specificities in a serum recognize different conformations of the same peptide epitope, all will bind well to the virion.

a, The folded arrangement of the polypeptide chain in an RVC domain, as found in icosahedral, positive-strand RNA viruses. The framework strands of the eight-stranded β-barrel are denoted by letters B–I. The intervening loops and terminal extensions vary significantly among RNA viral proteins, but the size and shape of the framework is relatively constant. The upper surface of the domain in this diagram faces the outside of the particle when packed in the capsid of an RNA virus. The structure of tumour necrosis factor (TNF), a non-viral protein with a similar folded conformation, is described by Jones *et al.* on page 225 of this issue[25]. TNF looks very similar to a simple RVC domain, but its packing in a trimer involves different interfaces from those used by subunits of RNA viruses. Barrels of similar topology, but of rather different size and shape, are found in other viral and non-viral proteins. ***b***, The packing of RVC domains in an icosahedral viral shell. Some of the copies of VP1, 2 and 3 are labelled. There are 60 copies of each in the virus. VP4, cleaved from the amino terminus of VP2, is internal. The letters 'b' and 'g' show positions of the BC and GH loops in VP1. In FMDV, the BC loop of VP1 is truncated and the GH loop is disordered. The virus particle therefore has 'dimples' on its 5-fold symmetry axes and a flexible protrusion near the positions marked 'g' (and their symmetry equivalents). In HRV14 and in poliovirus, the BC and GH loops of VP1 are both well-ordered and prominent. The cavity between them forms part of a groove or canyon that circulates around the 5-fold axes (roughly joining the positions marked '1' in the upper part of the diagram).

Neutralization of picornaviruses by antibodies is believed to require some degree of 'crosslinking' between subunits, perhaps to inhibit an essential expansion or concerted rearrangement of proteins in the capsid[13,14]. The flexibility of the GH loop in VP1 of FMDV could facilitate such crosslinking. Correlations between disorder and response to antipeptide antisera have been noticed before[15,16]. The GH loop of FMDV is a particularly striking example and the first to be associated with a successful vaccine.

Cells of many types contain adhesion proteins — collectively called integrins — that recognize the Arg-Gly-Asp sequence in proteins in the extracellular matrix[17]. The inhibition of FMDV attachment by peptides containing Arg-Gly-Asp receptors suggests that one or more of the integrins is the FMDV receptor. The definitive identification of receptors for two other picornaviruses — human rhinovirus and poliovirus — implicates other kinds of adhesion proteins as viral binding targets. Two families of human rhinoviruses have been identified, recognizing distinct receptors[18]. The main group binds to a protein of relative molecular mass 90,000[19] that has now been identified in two laboratories as intercellular adhesion molecule-1 (ICAM-1), a surface protein found on many kinds of cells[2,3]. This molecule mediates leukocyte adhesion by binding to a protein called lymphocyte function-associated molecule-1 (LFA-1), a homologue of the integrins[20]. ICAM-1 itself is a member of the so-called immunoglobulin superfamily — proteins with domains similar to domains of the immunoglobulin molecule. It contains five concatenated immunoglobulin-like domains, a transmembrane segment and a short cytoplasmic tail[21,22]. The poliovirus receptor, also just identified, has a rather similar structure, with three rather than five immunoglobulin-like domains, but it seems to correspond to a previously unidentified member of the family[4].

Receptor specificity is generally regarded as a major determinant of cell and tissue tropism as well as of virus host range. In this regard, the distribution and expression of ICAM-1 and of the poliovirus receptor raise real questions. Both appear to be expressed in tissues that do not normally support growth of the virus that recognizes them[2-4]. Indeed, messenger RNA encoding the poliovirus receptor can be detected in cells to which virus does not even attach[4]. Yet the new papers show that when polio or HRV receptors are expressed in transfected mouse L cells, they confer ability to bind virus[2-4].

Adhesion molecules such as ICAM-1 and the integrins might seem to be odd candidates for viral receptors. Poliovirus and HRV 14 are believed to enter cells by the receptor-mediated endocytosis pathway[23]. Rapid endocytosis is not expected to be a property of matrix and intercellular-attachment proteins, however, and how these viruses are chaperoned into coated pits and endosomes now becomes a significant puzzle. Are adhesion molecules endocytosed when clustered (requiring polyvalency of viral attachment)? Or is attachment only the first in a more elaborate chain of events? In other ways, as the groups studying it point out, ICAM-1 is a highly suitable receptor for rhinoviruses. Its expression on epithelial and endothelial cells is significantly induced by soluble mediators of inflammation[24]. Therefore, a local virus infection may indirectly enhance the abundance of nearby receptors, through mechanisms of the host inflammatory response, or interfere with that response, by blocking ICAM-1. The more general notion, that in viral pathogenesis a virus–receptor interaction may do more than merely mediate attachment, is strengthened by these observations. □

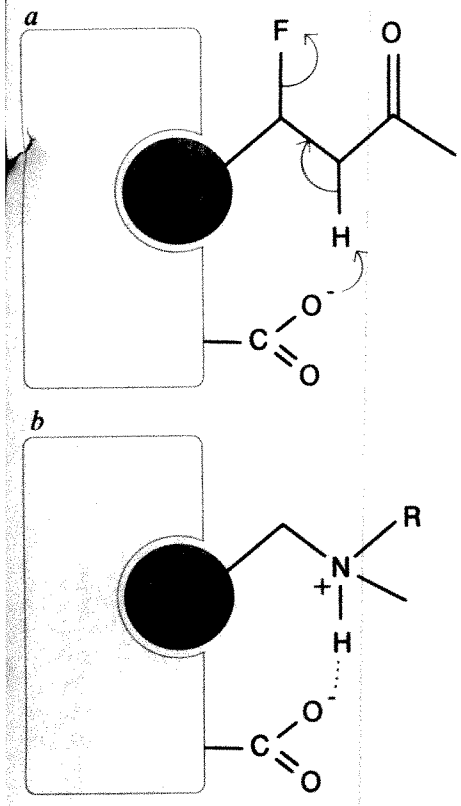
ENZYME CHEMISTRY

Designer catalytic antibodies

Robin J. Leatherbarrow



ENZYMES are well known to offer many advantages to the synthetic chemist. They often exhibit great specificity for the reaction catalysed, and work under mild conditions of temperature and pH in aqueous solution. The number of possible synthetic reactions, however, far exceeds the specificities of currently characterized enzymes, so there is considerable interest in producing enzymes with novel specificities by artifical means. Two routes have been used — protein engineering to alter the specificities of enzymes (ref. 1, for example); and the use of antibody molecules, which bind specific ligands (haptens) but which do not normally carry out chemical reactions. By clever design of the hapten it is possible to generate antibodies which catalyse specific reactions in the same way as an enzyme. On page 269 of this issue[2], Shokat *et al.* describe a new route to generate such catalytic antibodies.

Production of catalytic antibodies (abzymes) was first described in 1986 in simultaneous publications by the groups of Lerner[3] and of Schultz[4]. Their approach was based on two principles: that enzymes work by binding the transition state of a reaction better than the ground state; and that antibodies which bind specifically to any small molecule can be produced by coupling this molecule to a protein carrier and immunizing experimental animals. Lerner's and Schultz's groups reasoned that antibodies that were produced to bind transition-state analogues (molecules designed to mimic the shape and electronic configuration of the transition state) would function as enzymes towards the substrate of the reaction. Since then there has been considerable success in producing abzymes catalysing acyl-transfer reactions, carbon–carbon bond forming, and carbon–carbon bond cleaving reactions using these techniques (see ref. 2 and references therein).

Although the transition-state analogue approach has been successful, examination of natural enzymes shows that while some mechanisms involve exclusively transition-state stabilization[5], it is very common for groups within the active site to participate in the reaction. Acid/base catalysis involving proton donation or abstraction occurs particularly frequently. The problem addressed by Shokat *et al.*[2] is how such groups can be placed in the active site of an antibody with the precision required to generate catalytic activity. The reaction the authors chose was a β-elimination, reasoning that catalysis would be obtained by positioning a carboxyl group on the abzyme to abstract a proton. The desired reaction is shown in *a* in the figure. The abzyme needs a binding site for the main part of the substrate, and a carboxyl group which reacts as shown.

To produce this abzyme the authors immunized mice with a hapten containing a positively charged group, which they hoped would result in antibodies having a complementary negatively charged carboxyl group in the correct position to

PLANETARY ORBITS

a, Schematic representation of the reaction to be catalysed. The abzyme (light grey) requires a binding site for the substrate, together with a carboxylate group placed to carry out proton abstraction. *b*, The hapten used to generate the abzyme. A positively charged group is present so that the resulting antibody will tend to have a complementary negatively charged group involved in binding.

react (*b* in the figure). Of six monoclonal antibodies isolated, four accelerate the rate of β-elimination. This is a very high success rate, and suggests that the approach will be valuable in other reactions.

Given the mechanism of the reaction shown in *a*, one can speculate on the effect of introducing other charged groups into the abzyme. A positive charge near the fluoro group may be expected to enhance the polarization of the C–F bond and increase the rate of reaction. An additional carboxyl group (negatively charged) could be built into the hapten for this purpose, in an attempt to generate an appropriate abzyme. Depending upon the chirality of this carboxyl hapten, it may be possible to create abzymes specific for one or other of the enantiomeric forms of the fluoro substrate, and so confer stereospecificity on the reaction. □

Emerging stability and chaos

Andrea Milani

HAVE the planets been on more or less the same orbits, with only quasiperiodic variations, since the birth of the Solar System? This problem of the stability of the Solar System has been investigated for more than 200 years. The problem becomes even more difficult when one asks whether it is possible to compute the orbits of the planets for any time span, or whether there is a predictability horizon[1] beyond which there is no way reliably to compute where the planets will be (or were)? It now seems that the second question will be the first to be answered fully. J. Laskar reports on page 237 of this issue[2] that the orbits of the inner planets are chaotic: any two orbits with nearby initial conditions diverge exponentially over timescales of 5 million years. Thus any computation spanning more than a few tens of millions of years (much less than the age of the Solar System) gives results that do not reliably apply to nearby orbits, and hence may not apply at all to the real Solar System whose initial conditions are derived from observations of finite accuracy.

Our ability to compute the long-term orbits of the planets has leapt forwards over the past 5 years, mostly because of the availability of supercomputers. The project LONGSTOP brought together several research groups (including my own) to compute the orbits of the outer planets (from Jupiter to Pluto) for 100 million years[3]. The Digital Orrery, a parallel computer specifically designed and built to solve *N*-body problems, has recently increased this limit to 845 million years[4].

Laskar uses a 'conventional' supercomputer, but exploits the dedicated computer algebra processors developed at the Bureau des Longitudes in Paris to perform analytical averaging of the equations of motion[5]; this permits the orbits of all the large planets, including the fast-moving Mercury, to be followed for 200 million years. When these figures are compared with the age of the Solar System (4.5×10^9 years), the solution of the problem of the stability of the Solar System might appear close — only one order of magnitude further away. But if the orbits are chaotic, the problem cannot be solved by computing just one orbit for the required time span.

In analytical theories of the planetary orbits a series representation of the solution is constructed, and so-called small divisors occur, as a result of the presence of a dense set of resonances between the fundamental frequencies. A resonance occurs when the ratio between two frequencies, or their combinations, is precisely the ratio of two integers. Even if the main resonances (with simple ratios such as 3:2) are avoided, the minor ones are always close. As a result, the number of terms that have to be taken into account grows too fast for such a theory to achieve the accuracy which would be needed, even with the most powerful computer algebra systems. This difficulty was known to Poincaré[6], who showed that any perturbation theory constructed to apply to a set of given initial conditions must give divergent series. Thus the use of supercomputers to perform numerical integrations is not a concession to fashion but the only possible way forward.

The next difficulty is encountered when the results of such numerical integrations become available. Although the series resulting from a purely analytical theory are divergent, there are solutions to the *N*-body problem that can be represented by means of a convergent Fourier series, namely the 'conditionally periodic' solutions found by Kolmogorov, Arnold and Moser (see ref. 7). In most of these there are few fundamental lines and a wealth of combination lines with rapidly decreasing amplitude.

If the solution of the initial-condition problem used to model the Solar System belongs to this class, then the numerically computed solution can be fitted to a conditionally periodic solution. When this technique of the synthetic theory[3] was used for the major outer planets, the LONGSTOP team[4] found that the fit was very poor. The behaviour seems not to be 'conditionally periodic', but rather consistent with a solution chaotically wandering in a thin region of the phase space. For the inner planets, Laskar[2] has found that a conditionally periodic model is impossible to fit, suggesting a quite large chaotic region.

To some specialists of dynamics, the evidence that an orbit is not a conditionally periodic solution is as good as proving that it is chaotic. Unfortunately, there is no rigorous proof that every orbit must be either conditionally periodic or chaotic, or a case of escape/collision, although there is no evidence for other possibilities at present. Direct proof of chaotic motion for some large planet is also needed. This can be obtained by computing two initially nearby orbits and monitoring the rate of increase of their separation; if the rate is exponential with time, the orbit is chaotic and the coefficient inside the exponential is the (maximum) Liapunov exponent. This was first achieved for the orbit of Pluto by the Digital Orrery team, which recently reported that two nearby Plutos diverge with a Liapunov exponent of 1 per

20 million years; moreover Pluto appears to have a continuous spectrum[4].

Laskar finds an even shorter timescale for the exponential separation of the orbits of the inner planets[2]. In principle, if one planet is in a chaotic orbit, then they all are. But whatever Pluto, Mercury and Mars do, the large outer planets are so little perturbed by them that in practice chaotic effects on the larger planets should occur with negligible amplitude. Thus we do not yet have direct evidence of, for example, Jupiter being in a significantly chaotic orbit, although this is expected to be the case, possibly with a somewhat smaller Liapunov exponent. It should be stressed that the precise values of the Liapunov exponents are extremely sensitive to small changes in the initial conditions, the planetary masses and the model used in the computation; thus the exact values might change as a result of future work. But presuming that the order of magnitude of the Liapunov exponents is correct as currently calculated, it is clear that the orbits of all the planets cannot be reliably computed for a time span as long as the age of the Solar System.

Chaos, however, does not necessarily imply that the system is unstable, that individual orbits will change drastically. Although instability might occur, the timescale over which this will happen is unknown. If the solutions are chaotic, then any statement of the behaviour of the planetary orbits must be of a probabilistic nature, and has to be investigated by computing many solutions with different initial conditions. Although this cannot yet be done, there is a preliminary task that is within reach of our present computing capability, namely to understand the qualitative features of these chaotic motions.

The interesting point is that in systems such as the Solar System — those that are only slightly perturbed from being integrable (analytically solvable) — chaos does not arise at random. Rather, it arises because of resonances, and the region of phase space sampled is shaped by those resonances. An investigation of the resonances in the Solar System should thus permit an approximation of the minimum size of the chaotic region and hence allow the prediction of the likelihood and extent of instability. The computation of the maximum size of the chaotic region is not yet possible: transitions from one resonance to another can occur, even if the two do not overlap, in exponentially long time spans which cannot be calculated except for simple cases.

This resonance analysis is now in progress for the two examples of proven chaotic motion described above — Pluto and the inner planets. An interesting feature seems to be emerging, namely the ubiquitous nature of secular resonance. This feature can be defined as a resonance in which the longitudes of the planets — with periods between a few months and a few hundred years — do not appear. Because the perihelia and nodes revolve with frequencies, denoted by g_k and s_k, respectively ($k = 1,\ldots,9$), corresponding to periods of tens of thousands of years, a combination frequency can be considered nearly resonant if its period is many millions of years.

Pluto is locked in three different resonances, one involving the longitudes of Pluto and Neptune; another an irregularity of the perihelion of Pluto; and a third, secular resonance recently discovered in our LONGSTOP data (*Icarus*, submitted). All these resonances appear to result in regular librations, however, and not to disrupt the stability of the orbit of Pluto. Another small divisor which might be relevant is $(g_9 - g_8) - 3(s_8 - s_9)$; this combination of the fundamental frequencies is essentially zero in the Digital Orrery solution, and significantly different from zero in the LONGSTOP solution. The cause of this discrepancy is the source of some controversy between the two teams, but clearly very small changes used in the computation, for example to the planetary masses, can result in displacement either inside or outside a resonance with a very small associated chaotic region. For the other outer planets the smallest divisor is $2(g_5 - g_7) + (s_7 - s_8)$, and again there is a suspicion of different behaviour in the different solutions so far computed. In his most recent, as yet unpublished, data, Laskar finds that the divisor $2(g_1 - g_3) + (s_3 - s_4)$ is the main cause of the large Liapunov exponent found for the inner planets. The similarity between these secular resonances is remarkable.

For the moment, we are left with the enigma of an orbit of Pluto locked in so many resonances, chaotic, and still ostensibly stable over timescales of hundreds of millions of years. As for the inner planets, they seem to be even more strongly chaotic, and nevertheless they are still here. The problem is now to understand how chaotic orbits can be stable for timescales much longer than the inverse of the Liapunov exponent. The results from the current generation of long-term orbit computations seem to indicate that this is the rule rather than the exception for planetary orbits. □

DAEDALUS

New eyes for old

ALL of us, as we grow older, lose our ability to see closely in sharp focus. Bifocal, trifocal and even distributed-focal-length glasses are very imperfect solutions. Daedalus once invented a variable-focus pair of spectacles whose flexible plastic-film lenses could be pumped up with water to change the focal length — rather like the lens of the eye itself. He now returns to this idea with the crucial advance needed to make it practical and popular. His new variable-focus spectacles can focus themselves automatically.

After some thought, he has rejected the autofocus techniques used by modern cameras. His Autospecs do not measure the distance of the subject by means of an infrared beam; nor do they form an image and optimize its high spatial-frequency contrast. Instead, they take their cue from the eye itself. As the lens beneath the cornea focuses under the wearer's optical reflexes, its contour changes, and the cornea bulges or flattens in sympathy. Autospecs follow this process by means of small infrared sources on the spectacle frame, which bounce a pattern of beams off the surface of the eye to deduce its frontal curvature. The Autospecs then adjust their focus to aid the eye in its efforts. The whole arrangement acts as a fast-acting closed-loop servo system amplifying the wearer's own instinctive focusing. He will find his accommodation range magically extended. The proportion of focusing effort taken over by Autospecs will depend on their loop-gain. With sufficient loop-gain, they will restore focal power to almost fixed-focus eyes. As long as the wearer's instinctive effort to focus is perceptible at the cornea, the new glasses will sweep through their focal range until he is seeing sharply, and that effort relaxes.

This new technology will be widely welcomed. Bifocal glasses, which trade strained eyes for an arthritic neck, will rapidly vanish. Daedalus's prototype is rather heavy and clumsy, combining as it does corrective glass lenses, variable-focus liquid lenses, and quite a lot of electronics, but DREADCO's opticians are working hard to miniaturize it. They hope to give it a focal range far exceeding that of the eye itself, letting the wearer focus as closely and sharply as if he had a magnifying glass. Watchmakers, instrument mechanics, stamp-collectors and entomologists will be especially grateful. Daedalus even hopes for large sales among the young, who can focus quite well unaided. With his Autospecs focusing for him, the lenses of a youthful wearer will not be fatigued and work-hardened over the years by constant flexing. He will enter his middle years with eyes so wonderfully youthful that they may never lose their natural accommodation at all.

David Jones

Performance on a high level

We can land your projects!

BioInvent stands at your service in immunology. We offer you a full immunology development programme with know-how that spans:

- **In vitro immunization**
- **Custom hybridoma development**
- **Human monoclonal antibodies**
- **GMP large scale production and purification**

Take advantage of BioInvent´s expertise in immunology and hybridoma technology. We want to be your partner.

TAYLOR & FRANCIS GROUP

ANNOUNCING A UNIQUE NEW JOURNAL IN TOXICOLOGY FOR 1989

INHALATION TOXICOLOGY

Editor: **Donald E. Gardner**, NSI Technology Services Corporation, Environmental Sciences, Research Triangle Park, NC 27709, USA

Inhalation Toxicology will publish recent advances in all aspects of inhalation toxicology and includes in its scope state-of-the-art concepts in the pathogenesis and mechanism of lung disease • extrapolation of animal data to humans • effects of inhaled chemicals on extrapulmonary organs • innovative *in vivo* and *in vitro* lung models for predicting human disease • aerosol science and inhalation exposure techniques. The journal will demonstrate how epidemiological and clinical toxicological findings identify significant health effects from inhalation of environmental and occupational agents.

Hemisphere Volume 1 (1989) Quarterly 0895-8387 Institutional Rate: £56 (Personal Rate: US$69)

Distemper virus in Baikal seals

SIR—An acute disease of Lake Baikal seals (*Phoca sibirica*) attributable to morbillivirus infection became evident in the autumn of 1987 when weakened seals crawled onto the lake's icy shores and died. Many of them had paralysed hind extremities and ophthalmitis. No similar event is known from records going back to the 1930s. By October 1988, several thousand of the 80,000–100,000 seals in Lake Baikal had died.

In December 1987, during an expedition to Ushkani Island on the border between middle and northern Baikal, one of us (V.S.K.) noticed that three of the five dogs that lived there and had close contact with seals had died with typical symptoms of canine distemper virus (CDV) infection.

In the same month, we observed signs of a similar disease in a 6-year-old female seal (code PB-6). Two days after capture the animal seemed to have recovered but after a further 3 days it again showed symptoms of acute disease — diarrhoea, ophthalmitis and convulsions of the hind flippers. It died 10 days after capture. Rectal temperature varied between 34 °C on days 1 and 10, and 24 °C on days 5–7. No severe pathology of internal organs was observed but cytological investigations of bladder epithelium showed intracytoplasmic eosinophilic inclusion bodies characteristics of canine distemper[1]. Inclusions were also found in cells of liver, kidneys, spleen, lungs and in neurons of the brain and spinal cord.

When the sera of eight dead seals were studied, six gave weakly positive indirect haemagglutination reactions (titres of 1:10 to 1:80) with measles antigen[2], which is a close relative of CDV; all sera neutralized the cytopathic effect of CDV vaccine strain EPM[3] with titres from 1:8 to 1:64.

To prove the presence of a CDV-like virus in seal tissues, we have recently used the technique of oligonucleotide probing. On the basis of the known sequences of CDV RNA[4,5] we synthesized 14–40 deoxyoligonucleotide probes complementary to either virion RNA, or to the corresponding messenger RNA. The probes were designed to detect sequences that are either common to CDV and measles virus (probes 1–7, for gene *N* sequences, and probes 14–19 for gene *P* sequences), or sequences that differ between the two viruses (probes 8–13 for the gene *N* sequences that differ most). The precise sequences probed are shown in *a* in the figure. Probing revealed both virion and mRNA sequences in seal PB-6. These data suggest that CDV or a close relative was not only present but biologically active, inducing synthesis of its mRNA. These results and the preliminary immunological data were discussed at a conference held in Irkutsk in February 1988.

In June 1988, several hundred samples of blood and tissues of Lake Baikal seals were obtained during the spring cull. Of 83 spleen samples subjected to oligonucleotide probing, 8% gave a strong positive signal for CDV RNA and there was a total of 55% positive samples. The 45% negative samples confirmed that the assay is selective (*b* in the figure).

Along with CDV-neutralization tests, we also performed both radioimmunometric assays, using CDV vaccine absorbed on nitrocellulose and rabbit anti-seal IgG labelled with ^{125}I, and enzyme-linked immunosorbent assays (ELISA), using a monolayer of Vero cells infected with CDV in plastic wells and protein A conjugated with peroxidase[6]. A large proportion of animals tested contained antibodies against CDV in their blood.

In the neutralization assay, 55% of the sera had titres between 1:16 and 1:64; 50% were positive in the radioimmunometric assay; and 89% were positive by ELISA, with titres from 1:16 to 1:1,280. These data indicated that the whole population of Lake Baikal seals had been in contact with the virus, suggesting that the survivors should be immune to further infections. The lack of any unusual mortality of seals in the autumn or winter of 1988 confirms that immunity is now established.

We mentioned[7] CDV as the cause of the Baikal seal disease in September 1988 when, first from newspapers, and then from Dr A. Osterhaus, we learned that CDV or a closely related virus was also believed to have caused the disease of seals in Western Europe. This has been confirmed by several techniques[8,9]. According to nucleic acid hybridization and immunological data[10,11] the virus in European seals is not identical to CDV but a distinct seal virus (phocid distemper virus; PDV). Our data on Baikal seals prove only that they were infected by a morbillivirus closely related to CDV; its precise relationship to other morbilliviruses will only be established when the seal virus RNA has been sequenced. The fact that seals in Baikal and in Western Europe have been infected by very similar, or identical, viruses poses new questions concerning the origin and spread of the seal virus.

During a very recent visit, Dr A. Osterhaus brought us sera of European seals, some of which contained antibodies (with titres up to 1:1,080) to CDV in our ELISA. These data and those reported below by Osterhaus *et al.* strongly suggest that the Baikal and European seals have been infected by the same virus, or one that is closely related.

SIR—We have demonstrated the presence of an infectious morbillivirus in the organs of a Baikal seal (*Phoca sibirica*) collected on a recent visit to Lake Baikal.

The seal was one of three that had suffered from a canine distemper-like disease,

a, Oligonucleotide probing, using probes complementary to virion (V) or messenger (M) RNA, of liver and spleen of seal PB-6. Further details of the probes are given in the text. *b*, Oligonucleotide probing, using a mixture of probes 8, 10 and 12 in *a*, of spleens and livers from 36 seals without visible clinical symptoms culled in spring 1988.

Body temperature (*), lymphocyte counts (□), development of CDV-neutralizing antibodies (●) and virus isolation (⊞) during 12 days after inoculation of a suspension of liver and spleen from a Baikal seal into two dogs.

had the typical histopathological lesions of the disease in harbour seals (*P. vitulina*), and whose serum contained canine distemper virus (CDV)-neutralizing antibodies. Samples (2 ml) of a 10 per cent mixture of liver and spleen suspension were inoculated into two 12-week-old specific pathogen-free Beagle dogs, as previously described[9]. The animals were observed for the development of clinical symptoms and tested for the development of CDV-neutralizing and ELISA antibodies in their sera, for 12 days. As shown in the figure, both dogs developed essentially the same mild clinical symptoms as dogs inoculated with material from the European harbour seals, including a slight body temperature rise and lymphopaenia within 1 week, and mild respiratory symptoms including mucopurulent nasal discharge within 2 weeks. Antibodies were detectable within 7 days, and the presence of a morbillivirus in peripheral blood mononuclear cells of both dogs on days 7, 9 and 12 post-inoculation was demonstrated as previously described in the above reference.

These data clearly confirm earlier speculations that a morbillivirus identical with, or similar to, the virus that struck northwest European harbour seals, had previously infected and caused canine distemper-like symptoms in Baikal seals. We hope to compare the biological and molecular properties of the morbilliviruses isolated from the Siberian and European outbreaks in an attempt to discover whether there was an epizootiological link between the two outbreaks. If so, the morbillivirus may have spread from Siberia to Europe within 6 months either by terrestrial carnivores or by means of the extensive bird migration between Siberia and Europe.

Time asymmetry

SIR—Wolpert's reservations[1] on the 'Brussels School' approach to the problem of irreversibility, as summarized in Coveney's review[2], require a response.

Wolpert asks "why the underlying (time-symmetric) physics should imply the (overtly time-asymmetric) equations"? It is now well understood that it is precisely the instability of the underlying conservative reversible dynamics, which leads to the realization of the unitary group evolution, as a semigroup breaking the temporal symmetry.

As an example, let us consider the Kolmogorov systems, also mentioned in Coveney's review. These systems are characterized by a stable and an unstable partition of the initial data into cells evolving asymmetrically in time, under the conservative dynamical evolution. The remarkable fact about these partitions is that they are self-propagated by the dynamics, and not destroyed, as ordinary coarse graining partitions would be. The cells of the stable or K partition become refined in the future and coarser in the past, whereas the cells of the unstable partition experience the reverse behaviour under the dynamical evolution.

Therefore, for Kolmogorov systems an arrow of time is intrinsically built in, by observing the time-asymmetric evolution of the partitions. For these systems the second law is expressed as a selection principle of initial conditions. Only initial data leading to equilibrium in the future may be realized. The selection principle of the future arrow corresponds to a non-unitary realization of dynamics as a Markov process. This realization results from the operational limitations due to the continuous refinement under the dynamical evolution, to controlling or distinguishing trajectories in the same cell of the stable K partition. For these reasons K systems have been called intrinsically irreversible[3,4]. Therefore, Wolpert's first requirement — that the underlying dynamics be reversible — is automatically satisfied for the conservative K systems.

Concerning Wolpert's second requirement "why nature in fact chooses one direction in time over the other", for K systems there exist two semigroups, one leading to equilibrium in the future and the other in the past. The choice of the semigroup leading to equilibrium in our future corresponds to our physical experience. It is the basis of the formulation of the second law of thermodynamics: entropy increases in the direction of our future. The existence of a unique priviledged direction of time for all processes in our observable universe refers to the compatibility of the future arrow of intrinsically irreversible dynamical systems with the cosmological arrow of time. (For a recent discussion of the cosmological

roblem see ref 5.)

Wolpert returns to old criticisms of Boltzmann's pioneering work. In view of he recent developments of unstable lynamical systems it is now well under-tood[6] that the objections raised against Boltzmann, such as the Zermelo paradox, ire not meaningful, as the Poincaré recur-ence time is much larger than the Liapunov time, being the time after which ve lose control over the trajectories of a lynamical system.

In short, recent developments, inclu-ling those of the Brussels School, permit one to incorporate the second law into the formulation of dynamics for highly unsta-ble dynamical systems. In this way, the seeming contradiction between the rever-sibility of dynamics and the irreversibility of the second law has been overcome.

'Amylin' hormone

SIR—Leighton and Cooper[1] recently reported a potential physiological function of a newly discovered pancreatic β-cell hormone which they refer to as 'amylin'. The introduction of the term amylin is a source of potential confusion because this peptide has also been called islet amyloid polypeptide (IAPP)[2-4] and diabetes-associated peptide (DAP)[5]. This fact prompts us also to point out recent progress in relating IAPP/DAP/amylin, which we prefer to call IAPP, to type-2 diabetes (age-related diabetes mellitus).

The 37-amino-acid IAPP is the main component of amyloid deposits of the islets of Langerhans occurring in association with type-2 diabetes in humans and cats[2-5]. It is a normal product of pancreatic β-cells[3,6,7] that is colocalized and probably cosecreted with insulin[8,9] and generated through proteolytic processing of an 89-amino-acid precursor (ref. 10; C. Betsholtz *et al.*, unpublished data).

IAPP inhibits insulin-stimulated glycogen synthesis in skeletal muscle preparations *in vitro*[1]. This is interesting in relation to the pathogenesis of type-2 diabetes because this disease is characterized by peripheral insulin resistance in addition to islet dysfunction.

That amyloid formation is of importance to the pathogenesis of type-2 diabetes is implied by the correlation between the presence of an amino-acid motif in the IAPP molecule and both amyloid formation and the spontaneous onset of type-2 diabetes in adult humans, cats and racoons; this motif is lacking in species that do not develop islet amyloid or type-2 diabetes (C. Betsholtz *et al.*, unpublished data).

Thus, changes in IAPP synthesis, processing or release may relate to both major traits of the type-2 diabetic syndrome; islet dysfunction through amyloid formation and insulin resistance through a peripheral action.

On the SCIDs?

SIR—We recently reported (*Nature* **335**, 256–259; 1988) that a functional human immune system could be established effectively in mice with severe combined immunodeficiency (SCID mice) by inoculating them intraperitoneally with peripheral blood leukocytes (PBL) of human origin. The major immunological conclusions of that study are, first that recipient mice show prolonged survival with no ill effects of graft-versus-host disease; second, that the human leukocytes, including both B and T lymphocytes, increase in number and survive in these mice now for at least one year; third, that the reconstituted mice show significant levels of spontaneously secreted human immunoglobulin; and, last, that specific human antibody responses are inducible by immunization. These have all been confirmed in subsequent studies involving many more PBL-reconstituted mice.

More recent studies, however, have indicated that the numbers of intraperitoneally inoculated human PBL that migrate to the spleen, lymph nodes and peripheral blood during the first five-week period after reconstitution may be significantly less than those reported in Fig. 3 of our paper. For reasons not yet fully understood, antibodies used for detection of human cells show high levels of non-specific binding to splenic cells in these mice soon after reconstitution. Nevertheless, human cells do appear in these lymphoid organs in larger numbers at later times.

We caution other workers to be alert for this staining artefact, and we regret any inconvenience that our overestimates may have caused.

Quasar enhanced

SIR—During the recent appearance of Halley's comet, observations were reported[1,2] of enhanced scintillations of quasars occulted by the cometary ion-tail; however, Ananthakrishnan *et al.*[3] dispute such an origin for these scintillations.

The geometry at the time of both the 103-MHz observations[1] on 18–20 December 1985, and those at 327 MHz (ref. 3) on 10–12 February 1986, is depicted in the figure. On 18 December 1985, the source, PKS2314+03, lay at a solar elongation of about 85°, such that the solar wind contributed only to background scintillations, with an average scintillating flux of about 3 Jy (ref. 1). The observed enhancement was six times this value and 1.5 times the maximum flux normally caused by the solar wind, which, for 103 MHz, occurs at a solar elongation of about 30°.

During the 327-MHz observations[3] on 11 February 1986, the source 2052–106 was presumed to be occulted by the cometary tail. As the perihelion occurred on 9 February, the period 10–12 February is most inappropriate for observing such events: the solar elongation of 2052–106 on 11 February was about 10°, for which, at 327 MHz, strong scattering prevails. The scintillation index is near its maximum at around 14°. Consequently, most of the scattering occurs in a thin layer of the solar plasma centred around the point of closest approach to the line of sight from the Sun. The three control sources were also within 12° of the Sun. Therefore, the scintillation enhancements of all of the sources were due solely to the solar plasma. The source also gets broadened by strong scattering close to the Sun and enhanced outflow of cometary plasma, which results in reduced scintillation. These conditions are therefore unsuited to observing enhancement of scintillations by Halley's comet.

Thus, enhanced scintillations of

Relative positions of the Sun, the Earth and Halley's comet during the observations reported in refs 1 (December 1985) and 3 (February 1986). The paths of the quasar sources are also shown.

compact radio sources resulting from occultation by strong cometary ion-tails can be identified only for favourable alignments of the comet, Sun and observer. Such conditions existed during the observations reported in ref. 1 and it is possible, therefore, that the scintillations were of cometary origin. Unambiguous confirmation could be obtained by using more control sources close to the line of sight[4].

ANANTHAKRISHNAN *ET AL.* REPLY—The importance of our letter[3] lies in its demonstration that control sources are essential in investigations of scintillation through the cometary plasma tail. Alurkar *et al.* also agree that control observations are essential. Without such observations it is difficult to determine whether or not the observed[1] enhancement in scintillation is caused by the plasma tail.

We disagree with the suggestion that because our observations of 2052−106 on 11 February 1986 were made at a solar elongation of about 10° (actually 11.2°), the circumstances were unsuitable for studying the enhancement of turbulence. On the contrary, the outflow of plasma from the comet would be an order of magnitude higher for our observations than for those of Alurkar *et al.*[1], made at a solar elongation of 85° and before perihelion. Furthermore, angular broadening effects are unimportant unless the source is very much closer to the Sun. Therefore, the 60% enhancement seen by us (Fig. 2 of ref. 1) could have arisen either from the comet or from the solar wind. However, a similar increase in the control source implies that a solar-wind origin is most probable. In addition, observations far from the Sun, of the sources 1817−391 and 1921−293 along with control sources, also show no enhancement resulting from the plasma tail[3].

We agree that geometry of occultation is important. Unfortunately, cometary occultations of the required geometry are extremely rare, and consequently there is a need to take every available future opportunity for making occultation observations of radio sources by cometary tails (along with suitable control sources) in order to resolve the present conflict of results.

Zinc and LTP

SIR—Recent studies have implicated *N*-methyl-D-aspartate (NMDA) receptor activation and concurrent postsynaptic depolarization in the induction of long-term potentiation (LTP)[1]. Kauer *et al.*[2] recently showed that NMDA receptor activation produced only a transient potentiation in the CA1 region of the hippocampus and speculated that some additional factor, perhaps co-released with glutamate from presynaptic terminals, was essential for the later, long-lasting phase of LTP. We suggest that synaptic Zn^{2+} is the factor. Zn^{2+} is systematically localized in synaptic vesicles of excitatory synapses throughout the mammalian telencephalon[3] and probably is co-released with glutamate into the synaptic cleft with neuronal activity[4,5], especially at higher rates of stimulation Zn^{2+} decreases NMDA recepto mediated responses but increase quisqualate receptor-mediated respor ses[7,8], and may acutely modulate th postsynaptic response to glutamate. If th synaptically released Zn^{2+} can gain entr into postsynaptic neurons, it is possibl also that it could induce LTP. It has bee shown *in vitro*, that Zn^{2+} can activat protein kinase C and induce its transloca tion to membranes[9], both associated wit establishing LTP[1,2]. Entry of Zn^{2+} int neurons has not been clearly documente but it could pass through the NMDA channels. Zn^{2+} can block the NMDA channel (C. W. Christine and D. W. Choi manuscript in preparation). Mg^{2+}, an perhaps divalent cations in general, ma permeate the NMDA channel at a rat determined by the ease with whic surrounding water molecules can b lost[10,11]. Zinc can shed its water molecule at a rate between that of Ca^{2+} and magne sium[12], suggesting that its permeabilit may be greater than that of Mg^{2+}. The neurotoxicity of Zn^{2+} on cortical neurons is consistent with Zn^{2+} entry through the NMDA channel, as it is competitively blocked by the NMDA-channel blocker, MK-801, and increased by removal of extracellular Na^+ and calcium[13].

Thus the simple co-occurrence of NMDA receptor activation with post-synaptic depolarization could result in a calcium influx and transient postsynaptic potentiation. If the presynaptic neuron is firing sufficiently rapidly, Zn^{2+} could be released from presynaptic terminals and enter the postsynaptic neuron via NMDA channels, activating protein kinase C (and perhaps other intracellular processes) resulting in LTP.

The drug-reaction drama

Louis Lasagna

Responsibility for Drug-Induced Injury. By M.N.G. Dukes and D. Swartz. *Elsevier: 1988. Pp.431. Dfl.350, $184.25.*

RARELY does a new book have no competitor; Dukes and Swartz have written such a book. The authors' backgrounds are complementary, combining science (including political science) and the law. Although the literature on drug-related injury is abundant, as is that on the litigious implications thereof, Dukes and Swartz concentrate here on the *responsibility* for drug-induced injury. The volume should enjoy brisk sales, at least among lawyers and employees of pharmaceutical companies.

As the opening paragraph of the introduction (after a somewhat pompous first sentence) points out, it is important to determine when and how a drug injury is preventable, and in this assessment we need "to find out what went wrong". Unfortunately, that is often much more easily said than done. The 'Elixir Sulfanilamide' story is the exception; the deaths it caused were easy to explain and could all have been prevented, had the toxic solvent only been tested in animals for safety. Consider, in contrast, the Japanese 'S.M.O.N.' story, a devastating epidemic of neurological disease, blamed on clioquinol, a drug sold widely all over the world without manifesting toxicity like that seen in Japan. Even in retrospect, clioquinol seems likely to have been at best a 'co-villain', perhaps facilitating damage to the central nervous system by some neurotropic virus. And what of thalidomide, with which 'seal babies' could be reproduced in animals only with great difficulty after the fact, with many species, breeds and strains of rabbits, mice, rats, hamsters, dogs and primates failing to show the dreaded anomalies?

Dukes and Swartz say that "several thousand asthmatic patients may have been killed by high dose isoprenaline aerosols". But these high-dose preparations have disappeared, and 'epidemics' of asthma deaths have occurred periodically since then in different countries — only now they are generally attributed to undertreatment (for example with corticosteroids), not drug toxicity. Even with drugs taken off the market (benoxaprofen and Indosmos, for instance), the numbers cited for deaths attributable to them are soft indeed; sick, elderly patients who die while on a drug are not necessarily victims of the medication.

In an important introductory paragraph (p.6), the authors point out that in some countries (the United States being a prime example), there has been a tendency to seek compensation for injury from "the wealthiest or best-insured party (often the pharmaceutical industry) even when this has entailed redefining such considerations as foreseeability or retrospectively postulating the existence of a duty not previously recognized". Bendectin (Debendox) was the only prescription drug ever approved in the United States for treating the nausea and vomiting of pregnancy. Lawsuits alleging that it was a teratogen forced its withdrawal from the marketplace worldwide, even though there have been repeated verdicts of 'innocent' from expert panels and courts. One can safely wager that no sponsor will ever again try to market a drug for this indication in the United States (even though an early Australian critic of the drug has admitted faking his data). Fears of litigation have in effect driven most large US companies out of vaccine research and development, despite the clear need for new vaccines both for civilian and military populations.

Dukes has criticized 'me-too' drugs that "were merely slight variants on existing molecules . . . which provided no new benefit but merely introduced new risk". But it must be a rare pharmaceutical company that purposely markets inferior variants in today's very competitive market. Furthermore, half of the World Health Organization's *List of Essential Drugs* is made up of compounds that were *not* the first drugs in their therapeutic categories; many of these could be dubbed 'minor chemical modifications' of the breakthrough products. Would we really want to be restricted today to the earliest penicillins or the first sulphonamides?

The book accurately describes the complex basic problems in establishing causality, but does not adequately communicate the fact that certainty about the cause of a drug reaction (or even that one has occurred) is uncommon. Experts shown the data about a suspected reaction quite typically disagree vigorously — not least because multiple medications are often being taken by patients, and it is often impossible to rule out spontaneous co-morbidity unrelated to drugs, or the possibility that the patient is manifesting another aspect of his basic illness. One cannot usually state categorically that an ingested drug could *not* have caused a given adverse effect, but it is only rarely possible to state that a given drug was unquestionably the cause. Algorithms to identify causality (an area which my colleagues and I pioneered) are useful primarily as check lists, not as ways to eliminate uncertainty.

This book is not easy reading, and there are variations in the size of type that are difficult to interpret (is small for less-important material?). But potentially 'responsible' parties will ignore it at their peril. The authors address the obligations of a long list of players in the drug-reaction drama: physicians, dentists, medical students, manufacturers, drug retailers, dispensing pharmacists, nurses, patients, governments and official agencies. (One wishes that the legal profession were sometimes more 'responsible'; trivial and capricious suits are by no means uncommon — at least in the United States.)

Dukes and Swartz dedicate their opus to the World Health Organization. One can question, however, their assertion that "materials emanating from the WHO are probably the most authoritative of all documents on drug issues, representing a broad consensus". In my own experience with WHO committees, I have been struck by the compromises made necessary by the fact that the representatives from different countries must hammer out a document with which they can live on their return home. Consensus based on politics is not necessarily the ultimate in scientific authority. □

Louis Lasagna is Dean of the Sackler School of Graduate Biomedical Sciences and Director of the Center for the Study of Drug Development, Tufts University, Boston, Massachusetts 02111, USA.

Ways of being catty

Juliet Clutton-Brock

The Domestic Cat: The Biology of Its Behaviour. Edited by Dennis C. Turner and Patrick Bateson. *Cambridge University Press:1989. Pp.222. Hbk £35, $59.50; pbk £15, $22.95.*

IT IS probably because domestic mammals have been held in a certain disdain by zoologists that studies of their behaviour have been so neglected. To observe the behavioural patterns of the leopard, in the wild, will enhance status; it requires large sums of money, complicated equipment and personal courage; to watch the behaviour of the domestic cat requires only time, patience and experience in interpretation, yet the results may yield a greater knowledge of felid behaviour. Perhaps more importantly, they will yield information on the relationships between human beings and their animal companions, a subject that has been submerged for too long in pejorative terms such as 'anthropomorphism' and 'pet-keeping'.

This symposium volume, edited by Turner and Bateson, is the first work to bring together much of the research that has been carried out, in recent years, on the biological basis of behaviour in the domestic cat. It includes reports of studies on reproduction, social life, predatory behaviour, feral cats and house cats, all carried out with exemplary attention to the codes of ethology.

One aspect of research on the cat that is missing from the book is the connection between the patination and colour of the coat and temperament (as distinct from the link between breed and temperament which is discussed by Mendl and Harcourt, p.48). Karsh (p.173), when asking what influenced people's choice of a cat, was told by one woman that the personality of her cat was all-important to her. However, she later claimed not to be able to relate to a cat that was all white or all black, and that she related better to a cat that was grey or striped. Perhaps experience enabled her to predict what the general temperament of the animal would be from its pelage. In his article "Cats and Commerce" (*Scientific American* **237**, 100–107; 1977), Todd has postulated that black cats may be less aggressive and more tolerant of crowding than striped tabbies, which might therefore have a more distinctive temperament. Clearly, there is a need for more work on this topic.

An underlying thread in the book is the need to quantify the characteristics of individuality, and perhaps the greatest contribution to ethology that can be made from domestic animals will come from studies of behavioural variation. For unless a population of wild animals has been habituated, it is very difficult to categorize individual responses. People who live with cats know them as individuals; Mendl and Harcourt (pp.41–54) have made a start to defining individual variation and the biological significance of behavioural style.

The Domestic Cat is sure to become a classic in the study of behaviour in domestic animals. □

Juliet Clutton-Brock is in the Department of Zoology, British Museum (Natural History), Cromwell Road, London SW7 5BD, UK.

Out in the open

J.R.S. Fincham

The Release of Genetically-Engineered Micro-Organisms. Edited by M. Sussman, C.H. Collins, F.A. Skinner and D.E. Stewart-Tull. *Academic:1988. Pp.306. £29.50, $59.50.*

THE molecular cloning of genes and their transfer between different kinds of cells and organisms is now a standard analytical method, practised in almost every modern university biological department, and filling more than half of the pages of the leading biological journals. Anxiety about its safety was quite intense in some quarters in the late 1970s, but has largely died away.

Now we are faced with another wave of concern, this time arising from a wide range of schemes for putting genetically manipulated organisms to use outside the laboratory. Typically, this issue has generated less heat in Britain than in either the United States or continental Europe. This may, perhaps, have been a factor in the choice of Cardiff as the venue for the symposium from which this book stems. Sponsored jointly by the International Union of Microbiological Societies and three of its British and American constituents, it drew together contributions from a selection of the relevant university and institute-based scientists; scientists working in commercial laboratories were less well represented. The published proceedings include 13 papers, and about 100 pages are devoted to rapporteurs' accounts of eight round-table discussions.

The volume was hurried into print a mere seven months or so after the conference, and it suffers from most of the defects that make symposium proceedings (with a few distinguished exceptions) the most ephemeral and least worthwhile of library purchases. It lacks both the coherence of style and argument of a good book and the rigorous presentation of primary data that one expects in a good journal. The articles are uneven in style, ranging from the unduly terse to the prolix. The round-table reports contain some of the most interesting information, but it tends to be reduced to the status of anecdote by the lack of references. The index is very inadequate.

Nonetheless, this particular symposium volume is likely to attract much interest as a source of up-to-date information about the kinds of environmental release that are in prospect and the purposes that they are intended to serve. The symposium was mainly concerned with three areas of application: agriculture (improved nitrogen fixation and better pest control); biodegradation of chemical wastes; and the development of safe live vaccines. There is only one article (by J.E. Davies) on the present and impending applications to chemical and pharmaceutical industry. Important as these undoubtedly are, they do not involve environmental release but rather scaled-up indoor containment.

A theme running through several of the contributions is the need to ensure that any introduced micro-organism does not persist indefinitely in the environment. Roy Curtiss III proposes various non-lethal mutations, such as deficiency in cyclic AMP, which may militate effectively against long-term survival of engineered bacteria. D.H.L. Bishop *et al.*, in tests of a baculovirus intended for use as a narrow host-range insecticide against a moth, found that a mutant unable to make the polyhedral viral coat was still infectious but did not persist in the soil or on plant surfaces. It is intended, by further engineering, to make the virus even more deleterious to the moth than it is already, but this aspect is not dealt with in the book.

The main point of the article by S.E. Lindow and N.J. Panopoulos is that the now famous ice-minus *Pseudomonas syringae* does not survive well in the soil. Studies on persistence of released bacteria depend, of course, on efficient methods for detection and monitoring, the theme of the article by R.R. Colwell *et al.* Enumeration of soil bacteria by colony

counts depends on having specific selectable markers. Antibiotic resistance genes are generally unacceptable for environmental release but the *E. coli lacZ/Y* genes, which lend themselves to easy visual detection, are shown by D.J. Drahos *et al.* to provide a useful alternative. The most sensitive method of detection is probably to probe for a DNA sequence specific to the target organism after amplification of that sequence in the sample under test by the polymerase chain reaction. This does not, however, give a quantitative measure of abundance prior to amplification.

The promise of human benefit emerges most clearly in the articles on the development of new vaccines. A.A. Lindberg deals with vaccines against oral and enteric pathogenic bacteria, and E. Paoletti and his associates with the use of fowlpox virus vectors to vaccinate non-avian species. In one of the round-table discussions, E. Wedman reports vaccination of calves against Sinbis virus (not, in fact, a pathogen) with a recombinant between Sinbis and vaccinia.

There is nothing on the use of vaccinia virus as a vector for the expression of genes encoding immunogenic proteins of pathogens, except for a full documentation of the unhappy affair of the rabies vaccine trial, carried out on cattle in Argentina. The perfectly respectable sponsors of the trial had failed to obtain clearance from the local authorities, and incurred universal denunciation. Clearly, innovators in this area need to have both a proper regard for safety and acute political sensitivity. Live vaccines produced by genetic engineering, though likely to be safer than the old vaccines obtained by attenuation of pathogenic viruses and brought into use on a trial-and-error basis, will doubtless have to satisfy far more stringent safety criteria before being accepted.

Those seeking controversy will be disappointed in this volume. Although there is preoccupation with containment, nobody puts forward any scenario of disaster should containment fail. There are a number of rather coy references to 'perceived' risks, but the perceivers do not appear to have been present at the symposium. Although many of the public expressions of concern have undoubtedly been irrational or perhaps (as in the furore about the ice-minus bacteria) merely symbolic, it is difficult to take efficient precautions if one does not have some idea of what one is guarding against. No doubt the scientists present did have their own perceptions of hazard, or lack of it. It would have made for a better-balanced symposium had these been more explicitly discussed. □

Notes from the quantum field

Kate Metropolis & Chris Quigg

Beamtimes and Lifetimes: The World of High Energy Physicists. By Sharon Traweek. *Harvard University Press: 1988. Pp. 187. $20, £15.95.*

IF A coprophagous coleopteran stopped to reflect, its life would no doubt seem a noble quest. Nevertheless, the attention lavished upon the dung beetle by a Serious Entomologist would be flattering in the extreme, applauding — by reason of the entomologist's devoted interest — this scarab's life work. So it is with high-energy physicists and anthropologists: the life of the mind, the quest for nature's secrets, is suffused with its own divinity. But surely, to be taken seriously by serious persons must be the sincerest form of flattery. Sharon Traweek is a Serious Anthropologist and our colleagues must needs be flattered by her fascination with their habits and tribal customs.

The community Professor Traweek has chosen to study, that of experimental high-energy physicists, seems apt for classical anthropological analysis. The group has a shared past, anticipates a shared future, has rites for initiating new members and is able to distinguish itself from other communities. The population is divided into highly ordered, long-lasting associations: the handful of high-energy accelerator laboratories comprise several groups, each executing an experiment in its own style. A group consists of 50 to a few hundred physicists from different institutions, with varying backgrounds, specialities and levels of experience — graduate students, postdoctoral fellows, professors, laboratory staff members — who build a detector to gather data on subatomic particles and then analyse the information to construct a more complete picture of the Universe. Subgroups, sometimes individuals, are responsible for different parts of the hardware, software and analysis. Although people occasionally move between experiments and laboratories, the collaboration may last for a decade or more. The society is highly ordered, rich in mythology and customs; and, because there are communities of experimental high-energy physicists around the world, it offers anthropologists the opportunity to distinguish behaviour patterns endemic in the profession from expressions of national or ethnic traits.

Particle physics has well-known personalities — clowns, tyrants, thoughtful moralists, egomaniacs, wizards — about whom many people are curious. Are they typical? How do they interact? What order underlies a group in which the list of workers on a single experiment may fill an entire page of a journal? An analysis that revealed the strengths and weaknesses of a particular approach to large collaborations could be interesting, amusing and even cautionary for scientists in fields beginning to collectivize. Indeed, Traweek comes upon provocative questions: What are the norms of behaviour within the community? How are actions and motives analysed? Why do people who see each other day in, day out recount different versions of history?

Scientific inquiry requires that researchers play Devil's Advocate until they can convince themselves that their data are complete and can be trusted. Unlike the physicists she studies, Traweek evinces no scepticism towards her data and fails to convince us that she has gathered anything more than an idiosyncratic sample. *Beamtimes and Lifetimes* reads less like a mature analysis than like a collection of undigested field notes recording observations at SLAC, the Stanford Linear Accelerator Center in the United States, and KEK, the national high-energy physics laboratory in Japan.

Traweek consistently uses the experience or opinions of a few individuals to draw broad conclusions about the entire community. If these illustrations were used to vitalize an observation or conclusion, they would be useful. Without a convincing richness of supporting data, however, her inductions have a foundation of quicksand. Further, her decision not to identify her subjects means that they become interchangeable: one group leader, one laboratory director is presented as indistinguishable from another. Yet in fact these people have quite different personal and scientific styles. She does not make a plausible case for not differentiating them, so the reader can only conclude that her powers of observation are not equal to her task.

This judgement is reinforced by Traweek's methodology. Reporting a discussion of how wives of high-energy physicists supported their husbands' work, she writes, "The older wife of a laboratory director interjected that she thought the way to avoid distracting the husband from his important work was to pursue one's own interests seriously. By their glances at each other I gathered that the younger women disagreed". A moment's reflection provides a number of alternative interpretations: interest in each other's reaction to an unfamiliar point of view, exasperation over hearing this position put forth for the millionth time by someone in a situation different from theirs, and so forth.

A recurring theme for Traweek is gender bias and sexism in the education, the rites of passage and the practice of experimental high-energy physics — a subject that should not be trivialized. If

particle physics *is* a male culture (although saying so doesn't make it so), it is important to understand how it came to be that way and why it remains true. Traweek's summation is as cogent as the evidence that Beatles records, played backwards, contain messages of devil worship:

> The language used by physicists about and around detectors is genital: the imagery of the names SPEAR, SLAC, and PEP is clear, as is the reference to the "beam" as "up" or "down." One must see the magnets at LASS to appreciate the labial associations in the detector's name, Large Aperture Solenoid Spectrometer. Ironically, the denial of human agency in the construction of science coexists with the imaging of scientists as male and nature as female. Detectors are the site of their coupling: standing on the massive, throbbing body of the eighty-two-inch bubble chamber at SLAC while watching the accelerated particles from the beam collide twice a second with superheated hydrogen molecules made this clear to me.

The plethora of facts that Traweek has got wrong does nothing to encourage faith in her inductions. Descriptions of scientific apparatus, events and phenomena, intended to confer verisimilitude, are grossly inaccurate. Her judgements are no more convincing: the statement that the food at SLAC is "rather good, for a cafeteria" will come as a shock to anyone who has eaten there.

The neglect of the reasons that inspire people to join and remain in this community is a crippling omission. Particle physics is not a closed or isolated society in which membership is determined by happenstance. Because the only motive Traweek recognizes is career advancement, her narrative is oblivious to the excitement, the exhilaration of doing physics. Nowhere do we see people driven by curiosity, intoxicated with the creation and understanding of new experience.

Beamtimes and Lifetimes is not a complete or reliable guide to the community of particle physicists. Let it be taken nevertheless as an invitation to particle physicists to re-examine their values, institutions and assumptions about each other and about the rest of the world. □

Life transformed

Adrian Desmond

The Age of Lamarck: Evolutionary Theories in France 1790–1830. By Pietro Corsi. Translated by Jonathan Mandelbaum. *University of California Press: 1988. Pp. 360. $42.*

AT THE entrance to the Jardin des Plantes, opposite the Seine, stands an imposing statue of Lamarck, the "Founder of the Doctrine of Evolution". And in relief, at the back, is a touching scene depicting a lonely, dejected Lamarck being consoled by his sister. This image, of an isolated trailblazing figure, is surely one of the most enduring in the history of biology.

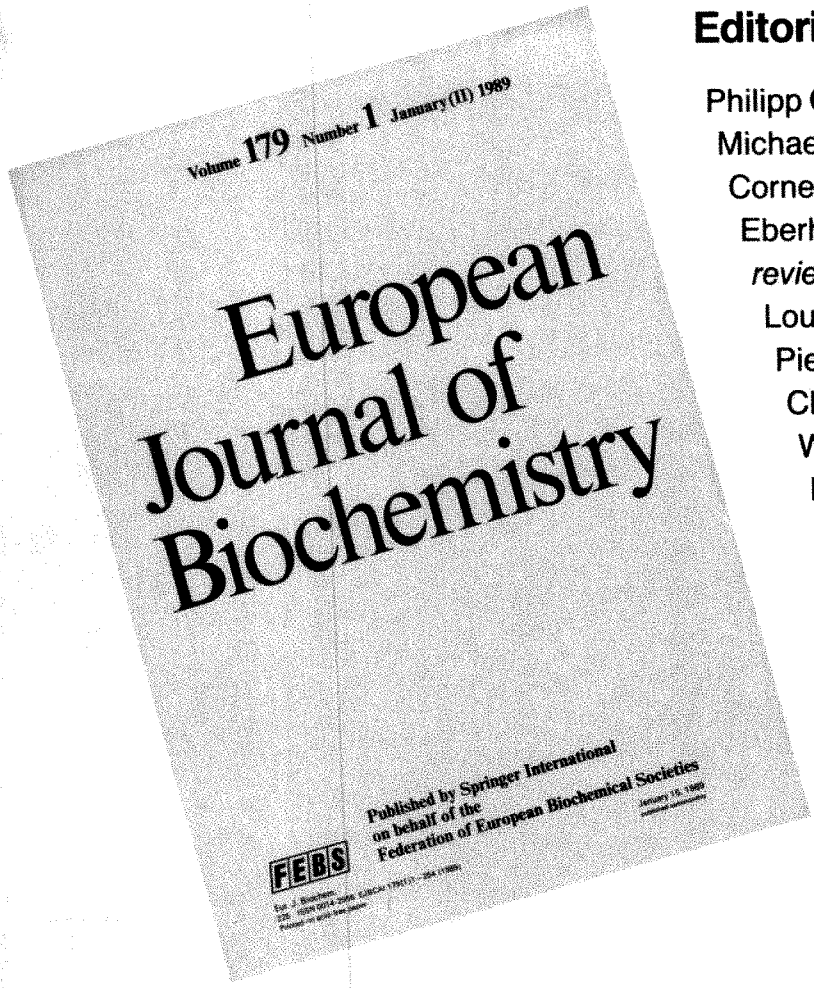
Now Pietro Corsi, in his stunning study of Parisian science after the Revolution, shatters this myth. He questions the long-standing assumption that Lamarck was a prophetic genius, striding alone, out of time and place. The truth was very different; so much so that Corsi actually talks of an 'evolutionary culture', of which Lamarck was but a part. And in investigating this culture, he has given us the most compelling account yet of French transformism between 1800 and 1830.

Historians have been quick to deny Lamarck an audience. But Corsi argues that the eighteenth-century buffonian tradition — with its grand, unifying view of nature and attempt to look at life through time — still had a populist appeal, even after the Revolution. And it was to the buffonians (most by then outside academia) that Lamarck spoke — to the marginal men appalled by the increasing specialization of science. They deplored Cuvier's attempt to subordinate natural history to a descriptive, analytical comparative anatomy. There were still plenty of these outsiders in 1800, criticizing Cuvier for failing to investigate the larger laws of nature. It was against this cultural background that Lamarck's own ambitiously theoretical works, with their rival approaches to *biologie* (his word), were formulated.

Lamarck started out as a botanist, chemist and conchologist, and he was appointed the professor of insects and worms at the Muséum d'Histoire Naturelle in 1793. Before 1800 he remained a staunch anti-transformist, adamant too that life and inorganic matter were separated by a chasm. Then suddenly in 1800 he switched tracks. His subsequent evolutionary views have always been difficult to interpret (if easy to parody). Corsi explains the origin and real meaning of Lamarck's ideas by tracing their development in detail through the critical period 1800–1802. By this means he is also able to show that, far from accepting spontaneous generation first, as historians had thought, Lamarck only warmed to it after shifting to evolution.

The fact that Lamarck rarely quoted or cited fellow authors has led to the belief that he was acting alone. But again Corsi introduces us to numerous other dissident intellectuals at loggerheads with the powerful Cuvier. Many rejected Cuvier's claim that some fossil animals were extinct, perhaps killed off by a marine inundation. Like Lamarck, they believed that these animals had simply changed their form in a gradually changing world. As a result, Corsi is able to show that Lamarck's famous *Philosophie Zoologique* (1809) was less an insular pioneering work than a running dialogue with his contemporaries.

Given this context, Lamarck's science makes sense. Of course there were inconsistencies. Lamarck had inordinate trouble squaring his progressing animal series with his non-progressionist geology; but, by the 1820s, a new generation had cast aside his old framework and mated evolution to a directionalist Earth history, which provided the environmental motor. There was also a good deal of frustration with the man himself: Lamarck exasperated even sympathizers with his pig-headedness, and they were less and less inclined to come to his aid. Even so, as Corsi says, he was never totally deserted by his friends, any more than he was completely ignored by his enemies, the way the old histories implied.



Still thinking — Lamarck's statue at the entrance to the Jardin des Plantes in Paris.

The Age of Lamarck was first published in Italy in 1983, and this translation (excellent in itself) has been well worth waiting for. Corsi makes Lamarck a man of his time, and that is no mean feat. For historians the result is a treat. But for Lamarck — pilloried and parodied for two centuries — it is long overdue justice. □

European Journal of Biochemistry now with a new cover design

Editorial Board

Philipp Christen (Zürich),
Michael J. Clemens (London),
Cornelius W. Hilbers (Nijmegen),
Eberhard Hofmann (Leipzig)
reviews editor,
Louis Hue (Bruxelles),
Pierre Jollès (Paris),
Claude Liébecq (Liège),
Walter Neupert (München),
David G. Nicholls (Dundee),
and Gösta Pettersson (Lund)

The journal publishes papers which make a significant contribution, either experimental or theoretical, to our understanding of the chemical or physical aspects of biological problems, or describe new methods applicable to biochemical problems.

Fields covered by the journal • nucleic acids, protein synthesis, and molecular genetics • protein chemistry and structure • enzymology • carbohydrates, lipids, and other natural products • physical and inorganic biochemistry • membranes and bioenergetics • metabolism and metabolic regulation • signal transduction and molecular neurobiology • molecular cell biology • developmental biochemistry and immunology

The European Journal of Biochemistry

- has no page charges
- supplies 100 free reprints
- allows free reproduction of published papers (except for commercial purposes)
- publishes reviews
- publishes the documents released by the Committee of Editors of Biochemical Journals and by the Nomenclature Committees of the International Union of Biochemistry

IRL Press at OXFORD UNIVERSITY PRESS

IN FOCUS

In Focus is a new series of textbooks offering the very latest information on fast-moving areas of biochemical and immunological research. Each book, written specifically for undergraduate and graduate students, is an up-to-date review of a high-interest topic, supplementing both lecture course and practical work.

MEMBRANE STRUCTURE AND FUNCTION: IN FOCUS

H. Evans and J. M. Graham

Includes:

Composition and structure; membrane receptors; membrane biogenesis and trafficking; membrane channels and bioenergetics

1-85221-099-0, 96 pp., illus., paperback, IRL Press, April 1989, £5.95

ANTIGEN-PRESENTING CELLS: IN FOCUS

J. M. Austyn

Includes:

Immune recognition; presentation in immune responses; accessory cells in culture; processing immunostimulation; accessary cells In Vivo

0-19-963005-4, 90 pp., paperback,, IRL Press, May 1989, £5.95

MOLECULAR BASIS OF INHERITED DISEASE: IN FOCUS

K. E. Davies and A. P. Read

Includes:

Recognising genes; mapping and tracking genes; identification in inherited disorders; molecular basis of human inherited disorders

1-85221-073-7, 88 pp., paperback, IRL Press, 1988, £5.95

GENETIC ENGINEERING: IN FOCUS

J. Williams and R. K. Patient

Includes:

Enzymology; E.coli cloning vectors; isolation of genes by molecular cloning; gene analysis and manipulation

1-85221-071-0, 82 pp., paperback, IRL Press, 1988, £5.95

FRONTIERS IN MOLECULAR BIOLOGY

Frontiers in Molecular Biology is a major and completely up-to-date review series designed to cover fast-breaking areas of molecular biology research.

FRONTIERS IN MOLECULAR BIOLOGY: GENES AND EMBRYOS

Edited by D. M. Glover and B. D. Hames

Includes:

Drosophila: the maternal contribution; Drosophila: the zygotic contribution; Caenorhabditis; Xenopus; the mouse

0-19-963028-3, 232 pp., IRL Press, June 1989, £27

0-19-963029-1, paperback, £18

FRONTIERS IN MOLECULAR BIOLOGY: ONCOGENES

Edited by D. M. Glover and B. D. Hames

Includes:

Oncogenes and cell proliferation; viral integration sites; molecular pathology of chromosomal abnormalities and cancer genes in human tumours; biochemical functions; oncogenes of the DNA tumour viruses

0-199630-34-8, 200 pp., IRL Press, June 1989, £27

0-199630-35-6, paperback, £18

THE PRACTICAL APPROACH SERIES

New Spiralbound Format

Starting with Genome Analysis, each *Practical Approach* title will be available in a new, hardcover, spiralbound format in addition to the paperback version.
Written specifically for laboratory use, these sought-after manuals will now lie flat on your work surface allowing even easier access to the latest protocols.

LIGHT MICROSCOPY: A PRACTICAL APPROACH

Edited by A. J. Lacey

Includes:
Principles and aims of light microscopy; making transparent specimens visible by inducing contrast; image recording; immunohistochemistry; histochemistry and the light microscope; fluorescence microscopy; micrometry and image analysis; video microscopy; chromosome banding
0-19-963036-4, 338 pp., spiralbound, IRL Press, 1989, £28
0-19-963037-2, paperback, £19

HPLC OF MACROMOLECULES: A PRACTICAL APPROACH

Edited by R. W. A. Oliver

Includes:
Columns for HPLC separation of macromolecules; HPLC instrumentation; size-exclusion HPLC of proteins; reversed-phase chromatography of proteins; high performance affinity chromatography; HPLC of oligonucleotides; affinity chromatography of complex carbohydrates using lectins
0-19-963020-8, 254 pp., spiralbound, IRL Press, 1989, £27
0-19-963021-6, paperback, £18

ANTIBODIES VOLUME I: A PRACTICAL APPROACH

Edited by D. Catty
0-947946-86-1, 208 pp., hardback, IRL Press, 1988, £29
0-947946-85-3, paperback, £19

ANTIBODIES VOLUME II: A PRACTICAL APPROACH

Edited by D. Catty

Includes:
Antibodies in blood group serology; antibodies in HLA serology; immunoassay using radiolabels; ELISA and related enzyme immunoassays; immunoperoxidase methods; fluorescence activated cell sorting; antibodies for tumour immunodetection
0-19-963018-6, 290 pp., hardback, IRL Press, 1989, £29
0-19-963019-4, paperback, £19.50
(note—Volumes I & II not available as spiralbound)
Volumes I and II also available as a set:
0-19-963062-3, hardback, IRL Press, 1989, £49
0-19-963063-1, paperback, £32.50

GENOME ANALYSIS: A PRACTICAL APPROACH

Edited by K. E. Davies

Includes:
Techniques for mammalian genome transfer; genome mapping by restriction fingerprinting; pulsed field gel electrophoresis and the technology of large DNA molecules; chromosome jumping; the polymerase chain reaction; DNA fingerprinting; mapping complex genetic traits in humans
1-85221-109-1, 208 pp., spiralbound, IRL Press, 1988, £27
1-85221-110-5, paperback, £18

PLANT MOLECULAR BIOLOGY: A PRACTICAL APPROACH

Edited by C. H. Shaw

Includes:
Analysis of plant gene expression and structure; isolation and analysis of chloroplasts and plant mitochondria; subcellular localization of macromolecules using microscopy; foreign gene expression in plants; protoplast isolation and transformation; transposable elements and gene-tagging
1-85221-057-5, 330 pp., spiralbound, IRL Press, 1989, £29
1-85221-056-7, paperback, £19

PROTEIN STRUCTURE: A PRACTICAL APPROACH

Edited by T. E. Creighton

Includes:
SDS gel electrophoresis; isoelectric focusing; two-dimensional PAGE; immunological detection; peptide mapping; disulphide bonds; minimizing irreversible modification; predictions from gene and amino acid sequences; spectral methods; immunochemical analysis; folding proteins; measuring conformational stability
0-19-963000-3, 370 pp., spiralbound, IRL Press, 1989, £30
0-19-963001-1, paperback, £20

PROTEIN FUNCTION: A PRACTICAL APPROACH

Edited by T. E. Creighton

Includes:
Maintaining protein function; ligand-protein binding affinities; ligand blotting; affinity labelling; cross-linking by disulphide bonds; competitive labelling; analysis, identification and purification of sequence specific DNA-binding proteins; chemical modification; site-directed mutagenesis; determining roles of subunits
0-19-963006-2, 320 pp., spiralbound, IRL Press, 1989, £29
0-19-963007-0, paperback, £19
Protein Structure and Protein Function also available as a set:
0-19-963064-X, spiralbound, IRL Press, 1989, £50
0-19-963065-8, paperback, £33

COMPUTERS IN MICROBIOLOGY: A PRACTICAL APPROACH

Edited by T. N. Bryant and J. W. T. Wimpenny

Includes:
Computers in taxonomy and systematics; data analysis packages; computers in fermentation; modelling; simulation; image analysis in microbiology; computers in clinical microbiology; computers in teaching microbiology
0-19-963014-3, 264 pp., spiralbound, IRL Press, April 1989, £27
0-19-963015-1, paperback, £18

PROTEIN SEQUENCING: A PRACTICAL APPROACH

Edited by J. B. C. Findlay and M. J. Geisow

Includes:
Protein and peptide purification; peptide preparation and characterisation; solid phase microsequencing; gas or pulsed-liquid phase sequence analysis; sequencing by mass spectrometry; manual methods; structure prediction
0-19-963012-7, 240 pp., spiralbound, IRL Press, April 1989, £27
0-19-963013-5, paperback, £18

MEDICAL MYCOLOGY: A PRACTICAL APPROACH

Edited by E. G. V. Evans and M. D. Richardson

Includes:
Laboratory diagnosis and antifungal monitoring; direct microscopy; culture and isolation of fungi; superficial mycoses; yeasts; subcutaneous mycoses; systemic mycoses; culture contaminants; serological tests; antifungal drugs; histopathology
0-19-963010-0, 340 pp., spiralbound, IRL Press, May 1989, £37.50
0-19-963011-9, paperback, £25

CELL GROWTH AND DIVISION: A PRACTICAL APPROACH

Edited by R. Baserga

Includes:
Measuring parameters of growth; mouse embryo cells; C3H 10T1/2 and NIH3T3 cell lines; human leukemia cells; normal human epidermal keratinocytes and mesothelial cells; cloned T cell proliferation; muscle cell cultures; human diploid fibroblasts; cell synchronization; BALB/C-3T3 cells
0-19-963026-7, 210 pp., spiralbound, IRL Press, April 1989, £27
0-19-963027-5, paperback, £18

MEDICAL BACTERIOLOGY: A PRACTICAL APPROACH

Edited by P. M. Hawkey and D. A. Lewis

Includes:
Bacteriology of urine; sterile body fluids; respiratory specimens; genital tract; tissue infections; intestinal disease; antimicrobial sensitivity testing; therapeutic drug monitoring; quality control; nosocomical infection; epidemiological techniques for investigation of infections
0-19-963008-9, 344 pp., spiralbound, IRL Press, May 1989, £34.50
0-19-963009-7, paperback, £23

Forthcoming June. . .

PROTEOLYTIC ENZYMES: A PRACTICAL APPROACH

Edited by R. J. Beynon and Judith S. Bond
0-19963-058-5, 270 pp., spiralbound, IRL Press, June 1989, £29
0-19963-059-3, paperback, June 1989, £19

NEW FROM
OXFORD
FASEB

Biomolecular Data
A Resource in Transition
Edited by **Rita R. Colwell**

Nucleic acid and protein sequence data are accumulating rapidly. Databases need to be efficiently organized and maintained if these data are to be easily accessible. This book discusses the problems involved and presents possible solutions, serving as a reference to current practice.
0 19 854247 X, 384 pp., illus., paperback, March 1989 £30.00

Computational Molecular Biology
Sources and Methods for Sequence Analysis
Arthur M. Lesk

The increasingly important field of computing with protein and nucleic acid sequences is examined in this book. It looks at the available data, possible calculations, the accessibility of programs and data, and the interpretation of results.
0 19 854218 6, 266 pp., illus., January 1989 £25.00

Genetic Variants and Strain of the Laboratory Mouse
Second Edition
Edited by **Mary F. Lyon and Antony G. Searle**

This is the authoritative reference for information on mouse genetic and chromosomal variants. It describes all the known genes, and features a range of genetic maps. The second edition has several new chapters, and includes full nomenclature information.
0 19 854204 6, 1,000 pp., illus., June 1989 £90.00

Eosinophils
A Comprehensive Review and Guide to the Scientific and Medical Literature
Christopher J. F. Spry

Recent studies have shown how eosinophil blood cells respond, take part in inflammation, damage parasites, and can often harm normal cells, especially in the heart. This book reviews the developments in the field. It includes over 2000 references, forming the most thorough review of the literature currently available.
0 19 261408 8, 502 pp., illus., December 1988 £50.00

The Peripheral Actions of 5-Hydroxytryptamine
John R. Fozard

5-hydroxytryptamine, or serotonin, is an important neurotransmitter, and the subject of much current research. This book examines the most significant recent developments, emphasizing their potential in the design of novel drug treatments.
0 19 261683 8, 444 pp., illus., June 1989 £45.00

The Fragile X Syndrome
Edited by **K. E. Davies**

The fragile X (Martin-Bell) syndrome is the most common genetic cause of mental retardation after Down's syndrome. This book reviews clinical, epidemiological, and cytogenic aspects of the disease.
Molecular Medicine Series
0 19 261836 9, 130 pp., illus., paperback, July 1989 £12.50

Brain Opioid Systems in Reproduction
Edited by **Richard G. Dyer and Richard J. Bicknell**

Many aspects of reproduction depend on brain signals controlling hormone secretion from the pituitary gland. Recently, opioid peptides have been shown to be essential in regulating sexual behaviour and reproduction. In this volume, experts explain the control processes.
0 19 857694 3, 384 pp., illus., May 1989 £45.00

Cytokines in Cancer Therapy
Frances R. Balkwill

Cytokines regulate cellular function, and may have a role in the processes of cancer. The basic research on these proteins is assembled here for the first time, and the current and potential clinical application discussed.
0 19 261797 4, 312 pp., illus., April 1989 £30.00
0 19 261715 X, paperback £18.50

Design of Enzyme Inhibitors as Drugs
Edited by **Merton Sandler and H. John Smith**

A much needed survey of approaches to the design of drugs which inhibit the action of certain enzymes in the body. It discusses the underlying physical and chemical inhibition processes, and the individual target enzymes currently being investigated.
0 19 261537 8, 700 pp., illus., February 1989 £90.00

Experimental Biochemistry
R. L. Dryer and Gene F. Lata

This textbook provides complete details of 25 laboratory procedures, with extensive descriptions of the theory and basic biochemistry behind each one. Topics include chromatography, spectroscopy, electrophoresis, radioimmunoassay, restriction mapping, and *in vitro* protein biosynthesis.
0 19 505083 5, 448 pp., illus., OUP USA, January 1989 £19.50

OXFORD UNIVERSITY PRESS

Membrane Transport

People and Ideas

Edited by **Daniel C. Tosteson**

This book presents a vivid picture of the history of membrane physiology. The significant conceptual and experimental advances are given comprehensive treatment, while key investigators are described in interesting detail.

American Physiological Society People and Ideas Series
0 19 520773 4, 370 pp., illus., OUP USA/American Physiological Society, April 1989 £50.00

Sodium-Calcium Exchange

Edited by **T. Jeff A. Allen, Denis Noble, and Harald Reuter**

The way a cell maintains its total calcium content is a central issue in physiology. This book introduces the reader to the role of sodium-calcium exchange in calcium homeostasis.

0 19 854735 8, 320 pp., illus., June 1989 £40.00

Cystic Fibrosis

Peter Goodfellow

Cystic fibrosis is the commonest autosomal genetic disorder in Caucasian populations. This book summarizes modern medical practice, and surveys the results of clinical research. It explores the molecular genetics, and points the direction for the future.

Molecular Medicine Series
0 19 261835 0, 120 pp., illus., paperback, May 1989 £12.50

Biochemical Genetics

A Laboratory Manual

Emmanuel Shapira, Miriam G. Blitzer, James B. Miller, and Diane K. Africk

This manual summarizes the common assays and laboratory procedures used for the diagnosis of genetic biochemical disorders.

0 19 505135 1, 128 pp., illus., paperback, OUP USA, May 1989 £19.50

Garrod's Inborn Factors in Disease

Edited by **Charles R. Scriver and Barton Childs**

First published in 1931, Sir Archibald Garrod's book was ahead of its time, linking chemical individuality with proneness to disease. It was not well received then, but this reprint shows how well he anticipated today's challenges of genetic disorders.

Oxford Monographs on Medical Genetics
0 19 261574 2, 264 pp., illus., Clarendon Press, May 1989 £25.00

Human Embryos

Assisted Reproduction, Experimentation and the Future

C. R. Austin

This book discusses, in a way accessible to non-specialists, the questions relating to the human embryo and new developments in reproductive medicine which have come to concern, puzzle, and even disturb many people.

0 19 261758 3, 176 pp., illus., Oxford Paperbacks, March 1989 £6.95

Nutrition in the Elderly

Edited by **A. Horwitz, David M. MacFadyen, H. N. Munro, N. S. Scrimshaw, Bertil Steen, and T. F. Williams**

The last decade has seen increases in life expectancy all over the world. This is largely due to improved nutrition, which is now especially important for the well-being of the growing elderly population. This book is a new addition to a series of authoritative WHO guides on ageing.

0 19 261793 1, 312 pp., illus., OUP/World Health Organization, May 1989 £35.00

NEW IN PAPERBACK

Data for Biochemical Research

Third Edition

Rex M. C. Dawson, Daphne C. Elliott, William H. Elliott, and K. M. Jones

This essential reference text is designed to supply research workers in biochemistry and related fields with precise factual information about the compounds, reagents, and techniques most frequenly used in the laboratory. The third edition has improved presentation of data and updated coverage of current topics in biochemistry and molecular biology.

0 19 855299 8, 592 pp., illus., paperback, Clarendon Press, February 1989 £20.00

Sensory Processing in the Mammalian Brain

Neural Substrates and Experimental Strategies

Edited by **Jennifer S. Lund**

Written as a tribute to Dr. Gerhard Werner, this volume presents the views of leading scientists working in the field of neurobiology of sensory systems, and the experimental approaches they are using.

0 19 504554 8, 350 pp., illus., OUP USA, April 1989 £36.00

Oxford Journals

Journal of Experimental Botany

For the pure and applied aspects of physiology, biochemistry, molecular biology, and biophysics of plants.

Subscription rates, Volume 40 (1989) 12 issues: £142.00 UK, US$320.00 North America, £185.00 elsewhere

For further information please write to Wini Moranville, Oxford University Press, Walton Street, Oxford OX2 6DP.

For further details of these and other Oxford science books please write to: Elizabeth Bone, Oxford University Press, Walton Street, Oxford OX2 6DP.
Readers in the USA should write to: Barbara Wasserman, Oxford University Press, 200 Madison Avenue, New York NY 10016.

1. ACTA TROPICA

Published in collaboration with the Swiss Tropical Institute

Editor: H. Hecker, Basel, Switzerland.

Acta Tropica, an international journal of biomedical sciences, gives attention to every aspect of this field relevant to human health, including veterinary medicine and biology in the tropics. The subjects dealt with range from medicine and community health to epidemiology and the biology of parasites and vectors as well as to toxinology. The journal is open to contributions concerning either basic or applied research in disciplines such as taxonomy, morphology, biochemistry, physiology and immunology. Contributions may be in the form of original papers, review articles or short communications.

1989: Vol. 46 (1 vol. in 6 issues)
Price: US$ 147.25/Dfl. 280.00 plus US$ 14.25/Dfl. 27.00 postage and handling
ISSN 0001-706X

Biochimica et Biophysica Acta

2. GENERAL SUBJECTS SECTION

The BBA General Subjects section's main focus is on Carbohydrate metabolism; Hormone metabolism; Connective tissue biochemistry; Protein turnover Lectins, toxins, venoms, inhibitors Blood clotting; Enzyme purification; Pigments; Biochemical & biophysical methods; Aging; Metabolic control; Amino-acid metabolism; Vitamins and coenzymes; Metabolic enzymology
Additional topics include: Intermediary metabolism of natural products, nucleotides, porphyrins; regulation of metabolic processes in cell-free systems; enzyme patterns and topics of general interest and application.

1989 Volume 990 - 993 (4 volumes in 12 issues)
Section price US $553.75/Dfl.1052.00 plus US $56.75/Dfl.108.00 postage and handling
ISSN 0304-4165

A new section of **Mutation Research**

3. DNAging

Managing Editors:
Claudio Franceschi, Modena, Italy., **Richard B. Setlow,** New York, USA., **Takashi Sugimura,** Tokyo, Japan., **Jan Vijg,** Rijswijk, The Netherlands.

In this new section of **Mutation Research**, the following major topics are covered:
1. Age-related changes in DNA sequence information and structure. Studies on chromosomal aberrations, gene rearrangements, mutations, changes in methylation, chromatin changes and conformational changes.
2. Molecular mechanisms of genomic destabilization. Studies on endogenous processes and exogenous factors contributing to the maintenance and/or chronic disturbance of genomic integrity.
3. Age-related macromolecular damage. Studies on endogenous or exogenous agents which can affect DNA, RNA and protein structure and function and their long-term consequences.
4. Age-related changes in information retrieval. Studies on the accuracy of transcription and translation and on the control of gene expression.

1989 - Vol. 219 (1 vol. in 6 issues), Price: US $159.50/ Dfl. 295.00 (including postage and handling), ISSN 0921-8734

NEW IN 1989 !

European Journal of Pharmacology

4. MOLECULAR PHARMACOLOGY SECTION

Editors: J. Bruinvels, W.H. Gispen and D.H.G. Versteeg, Utrecht, The Netherlands.

Scope: The **'European Journal of Pharmacology MOLECULAR PHARMACOLOGY section'** will publish manuscripts containing original information on interactions at the molecular level of substances with biological systems.
Areas of interest: Identification, characterisation and modulation of receptors and receptor subtypes, genetic expression of receptor proteins, chemical neurotransmission, signal transduction mechanisms, ion channels, second messengers.
Types of papers: In addition to full length papers, the journal will publish short communications and also short invited articles intended to debate recent advances in rapidly developing fields.

1989 - Volume 172 (1 volume in 6 issues)
Price: US $144.00/Dfl.295.00 plus US $13.00/Dfl.27.00 postage and handling
Subscribers to the European Journal of Pharmacology will automatically receive this section as part of their subscription.
ISSN 0922-4106

Entirely in English

5. FUNDAMENTAL AND CLINICAL PHARMACOLOGY

The international publication of the French *Association des Pharmacologistes*
Editors-in-Chief: S.Z. Langer Paris, France, **P. Meyer,** Paris, France, **J.F. Giudicelli,** Kremlin-Bicetre, France

This new journal considers full-length articles covering the entire field of pharmacology, from molecular studies to clinical investigations. Supported by an international board of consultant advisors, the editors maintain high scientific standards as criteria for the evaluation and publication of manuscripts

1989: Volume 3 in 6 issues , Price:*French FF 885 incl. postage and VAT*
USA & Canada US $ 166.00 , Rest of the world FF 995, including postage
ISSN 0767-3981

6. IMMUNOLOGY LETTERS

Editor-in-Chief: P. Perlmann, Stockholm, Sweden

Immunology Letters provides a vehicle for the rapid publication of concise research articles and minireviews in all aspects of immunology. The essential criteria for publication are clarity, experimental soundness and novelty. Results contradictory to current accepted thinking or ideas diverging from actual dogmas are considered for publication provided that they are based on solid experimental findings. Preference is given to papers of immediate importance to other investigators, either by their new methodology, experimental data or new ideas. Short Letters, commentaries and replies are also published, in order to provide a continuing forum for discussion.

1989: Vols. 20-22 (3 volumes in 12 issues) , US $ 505.25/Dfl. 960.00 plus
US $ 42.75/Dfl. 81.00 postage and handling *ISSN 0165-2478*

7. IMMUNOPHARMACOLOGY

With two new receiving centres !

Submissions may now be made to either:
Editor-in-Chief: J.R. Battisto, Department of Immunology and Cancer, The Research Institute, Cleveland Clinic Foundation, Cleveland, Ohio 44106, U.S.A., *or,* **Associate Editors: J.C. Foreman,** Department of Pharmacology, University College of London, Gower Street, London, WC1E 6BT, U.K., and **T.E. Hugli,** Department of Molecular Immunology, Scripps Clinic & Research Foundation, 10666 North Torrey Pines Road, La Jolla, CA 92037, U.S.A.

This journal provides a medium for the publication of investigations pertaining to immunology, pharmacology and toxicology.
Its scope encompasses: the action of hormones and their mediators, e.g. cyclic nucleotides and prostaglandins, in the regulation of the function of cells participating in immune responses - hormones and cell factors endogenous to the immune system that are bioregulatory for lymphocyte and macrophage maturation, differentiation and replication - cellular components that assist in regulating the functioning of cells synthesizing antibodies, cells mediating cellular killing and cells controlling immunological unresponsiveness - mediators of immediate and delayed-type hypersensitivities -

pharmacological substances used as probes into molecular and cellular events involved in immunological responses - items released through immunological and closely related pathways that are pharmacologically active at non-immunological levels - factors useful for prevention, prediction and diagnosis of clinical entities such as carcinomas, autoimmune diseases and immunological deficiences - viral and gene products operative in immunopathology - toxicological effects of immunotherapy and toxicological actions of immunological substances affecting biological systems.

1989 - Volumes 17 & 18 (2 volumes in 6 issues)
Price: US $321.00/Dfl. 610.00 plus US $28.50/Dfl. 54.00 postage and handling *ISSN 0162-3109*

8. JOURNAL OF IMMUNOLOGICAL METHODS

Editors: V. Nussenzweig, New York, U.S.A., and **M.W. Turner,** London U.K.

The *Journal of Immunological Methods* is devoted to covering techniques for: **1. Quantitating** and detecting antibodies and/or antigens and haptens based on antigen-antibody interactions. **2. Fractionating** and purifying immunoglobulins, lymphokines and other molecules of the immune system. **3. Isolating** antigens and other substances important in immunological processes. Labelling antigens and antibodies with radioactive and other markers. **4. Localizing** antigens and/or antibodies in tissues and cells, in vivo or in vitro. **5. Detecting,** enumerating and fractionating immunocompetent cells. **6. Assaying** for cellular immunity. **7. Detecting** cell-surface antigens by cell-cell interactions. **8. Initiating** immunity and unresponsiveness. **9. Transplanting** tissues. **10.** Studying items closely related to immunity such as complement, reticuloendothelial system and others.

1989: Volumes 116 - 125 (10 vols. in 20 issues) Price: US $ 1379.00/Dfl. 2620.00 + US $142.00/Dfl. 270.00 postage and handling ISSN 0022-1759
Members of the American Association of Immunologists may apply for a reduced personal subscription rate through the Association.

NEW!

9. JOURNAL OF LIPID MEDIATORS

Editor-in-Chief: B.B. Vargaftig Institut Pasteur, 25 Rue du Dr. Roux, Paris
Assistant Editors: G. Béréziat, Paris, France, and **M. Chignard**, Paris, France,

The **JOURNAL OF LIPID MEDIATORS** will publish articles on the chemistry, biophysics, biochemistry, pharmacology, toxicology, pathology, immunology and clinical aspects of lipid mediators in general. Lipid mediators include all the lipid derivatives from bacterial, plant and animal sources, such as lipo-soluble vitamins, phospholipids, lipoproteins, lipopolysaccharides or fatty acids and their metabolites and derivatives. Synthetic lipids having biological activity will also be considered.

1989 Volume 1 (1 volume in 6 issues), US $182.75/Dfl.347.00

Entirely in English

10. RESEARCH IN IMMUNOLOGY

Formerly Annales de l'Institut Pasteur/Immunology

Editor-in-Chief: P. Kourilsky, IParis, France

Editorial Board to whom manuscripts may be submitted:
J. Andersson, Uppsala, Sweden, **B. Askonas**, London, U.K., **Dr.Aarden,** Amsterdam, The Netherlands, **P.A. Cazenave,** Paris, France, **J-C. Cerottini,** Epalinges, Switzerland, **A. Coutinho,** Paris, France, **G. Hammerling,** Heidelberg, FRG, **T. Kindt,** Bethesda, USA, **A. Lanzavecchia,** Basel, Switzerland, **A. McMichael,** Oxford, U.K., **C. Martinez,** Madrid, Spain, **T.Meo,** Paris, France, **G. Moller,** Stockholm, Sweden, **M. Pierres,** Marseilles, France, **H. Ploeg,** Amsterdam, The Netherlands, **H. Sakano,** Basel, Switzerland, **T. Tada,** Tokyo, Japan, **J.J. van Rood,** Leiden, The Netherlands, **H. Zachau,** Munich, FRG.

Research in Immunology provides a medium for the publication of full-length articles on all aspects of immunology, including immunochemistry, cellular immunology, immunogenetics, and transplantation immunopathology. This international journal also provides Forums for the exchange of ideas and opinions and a new column 'Times and Trends'. The overriding criteria for publication are originality, high scientific quality and up-to-date relevance.
9 issue will be published this year.

1989: Volume 140 in 9 issues , Price: FF 1150 incl. postage and VAT USA and Canada US $192 (France FF 1075).
The French Franc price is definitive.

11. Sequencing of Proteins and Peptides 2nd Revised Edition

G. Allen (author) (Lab. Techniques, Volume 9)

Sequencing of Proteins provides you with the most up-to-date information selected to be the most appropriate for laboratory or referenece use
New information covers: FABMS; protein recovery methods; amino acid analysis; tandem, plasma desorption, FAB, and thermospray mass spectrometry. Appendixes give information on manufacturers and supplies, purification, and safety in the lab.
1989: xx + 426 pages
Hardback:US$ 131.75 / Dfl. 250.00, ISBN 0-444-81022-6
Paperback: US$ 44.75 / Dfl. 85.00, ISBN 0-444-81021-8

12. Immunochemical Techniques for the Identification and Estimation of Macromolecules 3rd Revised Edition

J. Clausen (author) (Lab. Techniques, Volume 1 Pt.III)

Revised and extended chapters include: lectins, HLA-antigens, and crossed-electrophoresis. New chapters deal with: the complement system, enzyme immunoassay systems, immuno-fluorescence methods, immunoadsorbent techniques, and recent developments in methodology.
Conveniently available in hardcover and paperback, this volume is unsurpassed both as a practical reference work, and as a laboratory manual.
1989: approx. 464 pages
Hardback: US$ 131.50 / Dfl. 250.00, ISBN 0-444-80909-0
Paperback: US$ 42.00 / Dfl. 80.00, ISBN 0-444-80920-1

13. Pharmacotherapy *edited by* J.T. DiPiro, et al.

By stressing the underlying pathophysiology, this new reference is one of the most comprehensive texts available on pharmacotherapeutics. An extensive volume of 1,730 pages, Pharmacotherapy includes in-depth sections on the pharmacological treatment of cardiovascular, respiratory, gastrointestinal, renal, neurologic, psychiatric, oncologic, and nutritional disorders. These sections are complemented by discussions, more detailed than in currently available texts, of the body's major organ systems and the pathophysiology underlying these diseases. In addition, the book has specific chapters devoted to important adverse drug effects.

1988 1,730 pages, cloth, US $75.00(fixed)/Dfl. 171.00, ISBN 0-444-01323-7

14. Synthetic Polypeptides as Antigens

edited by: **M.H.V. van Regenmortel, J.P. Briand, S. Muller and S. Plaué**

(Lab. Techniques, Vol. 19)

Synthetic Polypeptides as Antigens is the first volume to give a comprehensive treatment under one cover of the various techniques used for synthesizing peptides by the solid phase approach, for coupling them to carrier molecules and analyzing their immunochemical activity by a variety of immunoassays.
The book provides:
-detailed descriptions of procedures
-extensive bibliography
-detailed analysis of the structural basis of antigenicity in proteins

1988 350 p ages. PB: US $38.50/Dfl.73.00 ISBN 0-444-80974-0

RNA evolution and the origins of life

Gerald F. Joyce

The evolution of RNA is likely to have played an important role in the very early history of life on Earth but it is doubtful that life began with RNA. Consideration of what came before RNA must take into account relevant information from geochemistry, prebiotic chemistry and nucleic acid biochemistry.

THE question of life's origins is one of the oldest and most difficult in biology. The answer, if it is ever known, will not be a single statement of fact but rather an extended chronology, beginning with the formation of the Earth and ending with the appearance of cellular organisms. The problem is especially difficult because we have no direct evidence of the events that occurred during roughly the first thousand million years of the Earth's history. The oldest rocks that provide clues to life's distant past are 3.6×10^9 years old and by that time cellular life seems already to have been well established[1]. Modern organisms are so sophisticated that they furnish little information about what life was like before there was a genetic code and a translation apparatus. Extraterrestrial studies have yet to provide us with an alternative life form for comparison. We are left with only a partial understanding of the origins of life that is based largely on inference and conjecture.

From time to time in the quest for such partial answers, a new experimental fact emerges that forces us to view the problem of the origins of life in a different light. The results of the classical Miller–Urey experiments, in which amino acids were produced by circulating H_2, CH_4, NH_3 and H_2O past an electric discharge[2], for example, make it hard to escape the conclusion that amino acids were present on the prebiotic Earth. The synthesis of purines by polymerization of HCN (ref. 3) similarly suggests that adenine, guanine and other purines were available. The most recent example of such a finding is the discovery of RNA molecules with catalytic activity[4,5]: in addition to their recognized properties as templates, RNA molecules have enzymatic properties and are thus the only molecules known to function as both genotype and phenotype.

This has led to a revival of interest in the idea that there was a time, before the origin of protein synthesis, when life was based entirely on RNA. The idea is not new: it dates back eighteen years before the discovery of catalytic RNA[6] and was discussed extensively in the late 1960s[7–9]. But the discovery of catalytic RNA caused molecular biologists to begin to take the notion of an 'RNA world' seriously[10–12]. It is by no means a foregone conclusion that life began with the RNA world, although several lines of evidence suggest that the RNA world existed at some stage in evolutionary development. Here, I shall briefly review the advantages of RNA as the basis for the early evolution of life, before discussing the chemical obstacles to the initiation of an RNA world and suggesting how in principle they might have been overcome.

Why RNA?

A fundamental property of living systems is that they have a chemical basis for the storage of genetic information. RNA, DNA and other nucleic-acid-like compounds are informational macromolecules that have inherent template properties and so lend themselves in a straightforward way to both storing information and replicating it. It has been argued that to focus on nucleic acids is to take too parochial a view: there may have been other information storage systems with template properties that were more readily available on the primitive Earth. Cairns-Smith, for example, has proposed[13] that life began with self-replicating clays, with the genetic information stored as a distribution of charges along a clay surface and replicated by ionic interactions between existing and newly-formed surface layers. Other templating systems have been proposed based on organic compounds other than nucleic acids[14,15] or a combination of minerals and associated organics[16]. While keeping an open mind about these possibilities, enthusiasm has to be tempered until there is experimental evidence that such an entity can both replicate and code for specific catalytic behaviours.

Could it be that the first genetic molecule did not have template properties and replicated itself in some other way? There was a time when it was widely believed that life began with self-replicating proteins[17]. After all, polypeptides are capable of a wide range of catalytic behaviours and it is very likely that they were produced abiotically on the primitive Earth[18]. The amino-acid sequence of abiotic polypeptides would have been tremendously heterogeneous, so we must postulate that some mechanism existed to ensure that a particularly useful sequence would facilitate the production of additional copies of itself. Dyson first suggested the possibility of a self-sustaining network of proteins in which the components mutually catalyse the synthesis of each other from monomeric starting materials[19]. Kaufmann has argued that, given a large enough assemblage of random polypeptides, the emergence of a self-sustaining network is almost inevitable[20]. This conclusion seems to me to rest on a highly over-optimistic estimate of the probability that a random polypeptide can catalyse peptide-bond formation with any significant degree of sequence specificity. Any experimental evidence to the contrary would be wecome.

The evidence that life was based on RNA at some stage in evolutionary history is circumstantial but, I believe, persuasive. None of the following points is convincing by itself but together they constitute a body of evidence that cannot be dismissed as coincidental. First, the template properties of RNA enormously simplify the task of self-replication. RNA genomes are known to exist in certain viruses and Orgel has shown that RNA templates are able to direct the synthesis of complementary oligomers in a chemical system[21]. Second, RNA has catalytic properties, as exemplified by the self-splicing activity of certain group I and group II introns[4,22], the transfer RNA processing activity of the RNA component of RNase P (ref. 5), and the self-cleaving activity of 'hammerheads' and related RNA structures[23,24]. These behaviours, although of doubtful prebiotic significance in themselves, indicate that life based on RNA would have included function as well as informational properties. Third, RNA plays an important part in modern biological systems, appearing most conspicuously in those cellular processes that are presumed to be among the most ancient. RNA primes DNA synthesis during DNA replication, carries the genetic message from DNA to the translation apparatus, gathers and positions amino acids in accordance with the codon structure of messenger RNA and functions as an integral part of the ribosome. RNA also has a central role in the spliceosome apparatus[25,26] and is an essential component of the ribonucleoprotein enzyme that directs telomere synthesis in eukaryotic cells[27]. Fourth, most of the biological coenyzmes are nucleotides or compounds that could be derived from nucleotides (Table 1), a curious fact that may indicate that RNA and RNA enzymes were present before the development of protein synthesis[28]. Fifth, histidine, which is important in enzyme catalysis as either

a nucleophile or general acid–base catalyst, is produced by a very unusual biosynthetic pathway that begins with phosphoribosyl pyrophosphate and adenosine triphosphate (ATP). The functional imidazole moiety, which now operates as part of a histidine residue within a protein enzyme may once have operated as part of a purine base within an RNA enzyme[28]. Sixth, in contemporary metabolism, deoxyribonucleotides are synthesized by enzymatic reduction of ribonucleotides rather than by a biosynthetic pathway comparable to that used to synthesize ribonucleotides. The most widely distributed reaction system makes use of three nucleotide-derived components: two molecules of flavin adenine dinucleotide (FAD) associated with thioredoxin, and one molecule of nicotinamide adenine dinucleotide phosphate (NADP). Seventh, deoxythymidylic acid is formed by 5-methylation of deoxyuridylic acid, again suggesting the primacy of ribonucleosides over deoxyribonucleosides.

The most important feature of RNA is that it combines genotype and phenotype in a single molecule, so that replication of RNA enables darwinian evolution to occur at the molecular level. Genetic variation is introduced as a result of mutational errors and RNA-catalysed recombination events. This variation is in turn expressed as a range of phenotypes. Because of differences in their chemical behaviour, some RNAs will replicate more efficiently than others and will grow to dominate the population until a new variant with even greater selective advantage arises[29]. This is the RNA world.

There are several objections to the notion that life began with RNA, that fall into two general categories. First, RNA is biochemically inept, particularly when compared to proteins whose catalytic prowess is so apparent in modern biochemistry. With the discovery of catalytic RNA, this argument has lost some force but it can still be said that RNA does not seem as versatile a catalyst as protein is. Second, RNA is not a plausible prebiotic

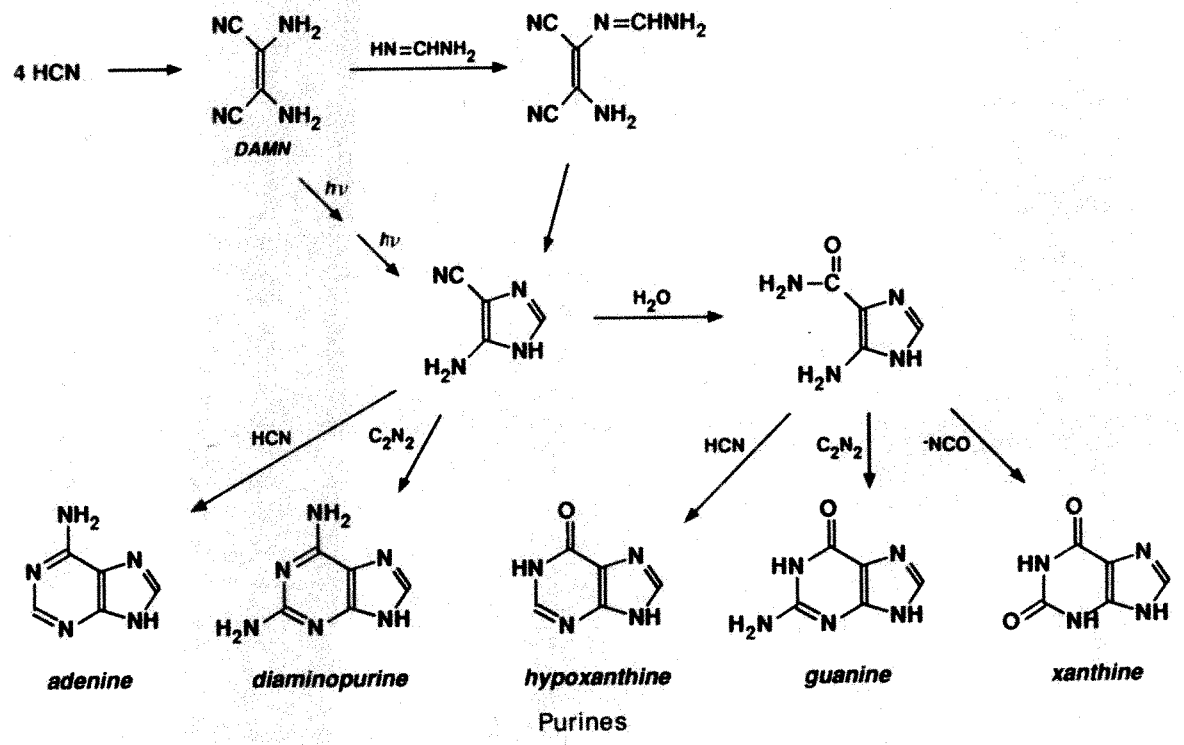

FIG. 1 Prebiotic synthesis of purines by self-condensation of HCN. HCN undergoes a tetramerization reaction to produce diaminomaleonitrile (DAMN). The rate-determining step is the attack on HCN by CN^- to form a dimer, rapidly converted to a trimer and then to the tetramer, DAMN. This reacts with either formamidine or ultraviolet light to produce 4-aminoimidazole-5-carbonitrile, which in turn leads to the formation of various purines.

TABLE 1 Coenzymes that resemble nucleotides

Coenzyme	Base	Sugar–phosphate	Substituent
NAD	Adenine	Ribose 5′-phosphate; ribose 5′-phosphate	Nicotinamide
NADP	Adenine	Ribose 2′, 5′-bisphosphate; ribose 5′-phosphate	Nicotinamide
FAD	Adenine	Ribose 5′-phosphate; ribitol 5′-phosphate	Isoalloxazine
FMN	—	Ribitol 5′-phosphate	Isoalloxazine
TPP	Pyrimidine	Pyrophosphate	Hydroxyethylthiazole
THF	2-Amino-4-hydroxy-6-methylpteridine	—	*p*-aminobenzoic acid; glutamic acid
Coenzyme A	Adenine	Ribose 3′-phosphate, 5′-diphosphate	Pantothenic acid; β-mercaptoethylamine
Coenzyme B_{12}	Adenine; 5,6-dimethyl-benzimidazole	5′-Deoxyribose; α-ribose 3′-phosphate	Cobalamin
S-adenosylmethionine	Adenine	Ribose	Methionine
ATP	Adenine	Ribose 5′-triphosphate	—
UDP-glucose	Uracil	Ribose 5′-diphosphate	Glucose
CDP-diacylglycerol	Cytosine	Ribose 5′-diphosphate	Diacylglycerol

The carrier molecules *S*-adenosylmethionine, ATP, UDP-glucose and CDP-diacylglycerol are included with the traditional coenzymes. A number of other nucleoside diphosphate sugars are known to act as carriers in contemporary metabolism. FMN, flavin mononucleotide; TPP, thiamine pyrophosphate; THF tetrahydrofolate; UDP, uridine diphosphate; CDP, cytidine diphosphate.

molecule because it is unlikely to have been produced in significant quantities on the primitive Earth[30]. This is a more serious criticism that goes to the heart of the question of whether RNA was the first genetic molecule or whether it took on the role of genetic material at a later stage in evolutionary history. Next, therefore, I consider how difficult it would have been to synthesize RNA in the prebiotic environment.

The primordial setting

Perhaps the most surprising aspect of the origins of life on Earth, other than the fact it happened at all, is that it happened so quickly. The Earth was formed from a diffuse cloud of cosmic gas and dust about 4.6×10^9 years ago[31] and by most accounts, was a very inhospitable place for the first $0.4–0.6 \times 10^9$ years of its history. It is virtually certain that no useful organic chemistry could have occurred until about $4.0–4.2 \times 10^9$ years ago—after the Earth's crust had formed[32] and the level of meteoric impacts had subsided so that the environment was no longer in constant upheaval[33]. On the other hand, the fossil record strongly supports the existence of cellular life by 3.6×10^9 years ago[34] and it has been claimed that indirect evidence exists for biological carbon fixation as early as 3.8×10^9 years ago[35]. The time window for biogenesis, from organic chemistry to a primitive cell, seems to be 'only' about 0.4×10^9 years.

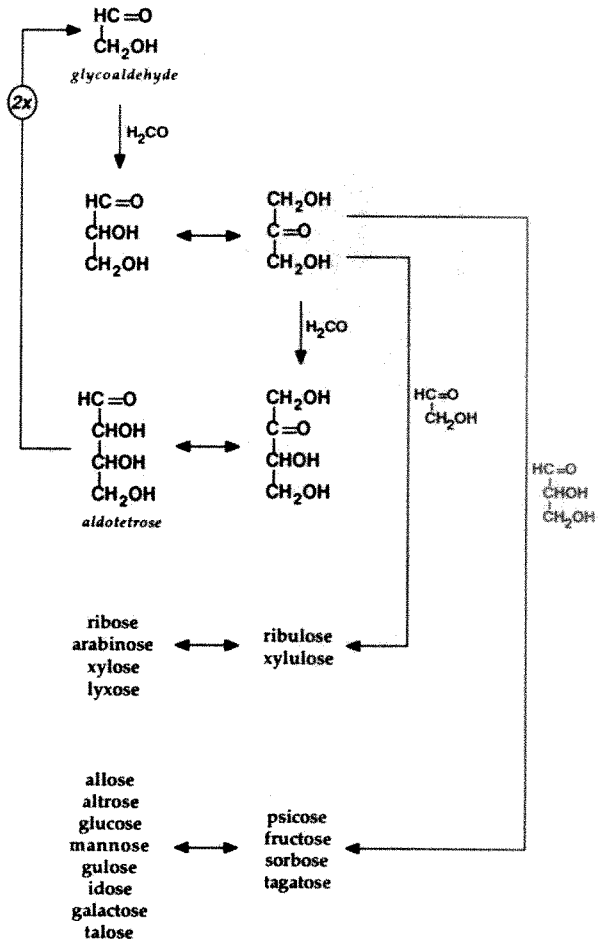
The composition of the prebiotic atmosphere is a problem of fundamental importance to our understanding of the origins of life. Until recently, it was generally thought that the prebiotic atmosphere was strongly reducing, containing mostly H_2, CH_4, NH_3 and H_2O[36]. As scientific models of planetary formation have become more sophisticated, it has become increasingly clear that we do not really know whether the prebiotic atmosphere was strongly reducing, mildly reducing or even non-reducing, although it seems certain that there was no free oxygen ($<10^{-6}$ atmospheres) until the advent of oxygen-producing photosynthetic bacteria about $2.5–2.9 \times 10^9$ years ago[37]. At present, the weight of evidence indicates that the prebiotic atmosphere was not strongly reducing.

The atmosphere was formed primarily by outgassing of volatile components of the primitive mantle. Its initial composition depends on whether outgassing occurred before or after the iron-rich core of the planet had formed: if outgassing occurred before core formation, contact with metallic iron would have ensured a strongly reducing atmosphere, containing mostly H_2, H_2O, CH_4 and CO; if the iron had already sunk to the core, the redox state would have been determined by the Fe^{2+}/Fe^{3+} ratio in iron minerals, resulting in a less reducing atmosphere that contained H_2O, CO_2, H_2 and CO but almost no CH_4[38]. It has been argued that even if reduced species such as CH_4 and NH_3 were produced before core formation, they would have been rapidly depleted by photodecomposition[39]. As time went on, escape of H_2 from the upper atmosphere and outgassing of less reduced species would have tipped the chemical balance in favour of CO and CO_2 over CH_4 and in favour of N_2 over NH_3. There may have been some mechanism for the continued production of CH_4 and NH_3, such as the slow re-equilibration of CO_2 and CH_4 at temperatures below 873K (ref. 40), by the arrival of CH_4 and NH_3 on comets and meteorites[41] or by the photochemical reduction of CO_2 in the presence of Fe^{2+} (ref. 42).

Although a strongly reducing environment is most favourable for the synthesis of organic compounds, several prebiotic syntheses have been demonstrated under less strongly reducing conditions. Consider the synthesis of hydrogen cyanide and formaldehyde, which in turn provide a good starting point for the synthesis of more complex materials. Both HCN and H_2CO have been obtained in good yield in spark-discharge experiments under mildly reducing conditions (partial pressure of N_2 of 100 torr and H_2 of 0–400 torr)[43]. Even in the absence of H_2, the yield of HCN and H_2CO is about 2% (based on carbon) or about 2–3 nmol J^{-1} (based on the energy input). This works out to about 4.5×10^9 kg yr^{-1} on the primitive Earth, assuming the energy available from the solar corona discharge was 12.6 J cm^{-2} yr^{-1} (ref. 44). A photochemical source of comparable magnitude has been proposed for both HCN (ref. 45) and H_2CO (ref. 46).

Once produced, HCN would have been hydrolysed and H_2CO would have been destroyed by ultraviolet irradiation, unless they happened to enter a relatively protected microenvironment and managed to combine into more stable compounds. But such combination cannot occur unless the reactants build up to sufficiently high concentrations, which they cannot do unless they are already protected from decomposition. Two possible solutions to this dilemma have been suggested: there may have been a physical mechanism for concentrating the reactants, such as adsorption on a mineral surface[47] or eutectic freezing in a shallow pond or hail particle[48]; alternatively, the condensation reactions may have been catalysed and thus may have operated at much lower concentrations of reactants. An example is glycolonitrile, which is produced readily from HCN and H_2CO and which enhances the rate of HCN oligomerization by one to two orders of magnitude[49].

With HCN and H_2CO thus provided, and with the goal of the RNA world in mind, what came next? Assuming that HCN and H_2CO were present in sufficient quantities to kindle HCN oligomerization, several biologically important molecules would



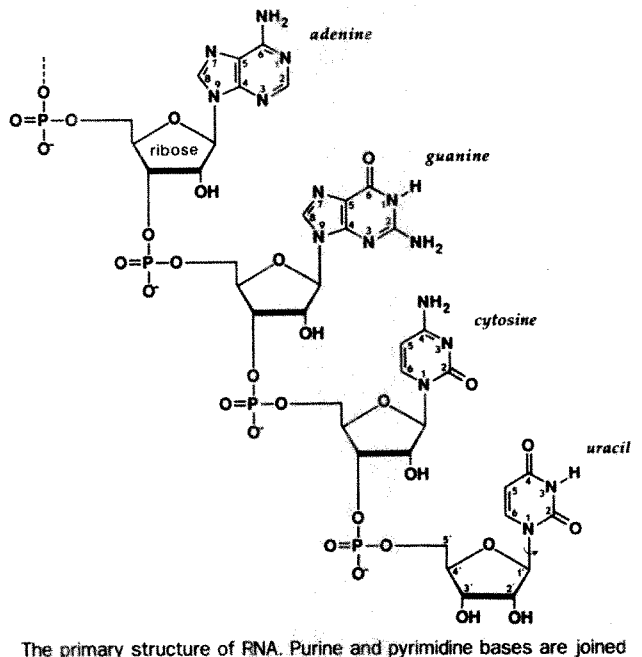


FIG. 2 The formose reaction for the prebiotic synthesis of sugars. Single-headed arrows represent aldol condensations (combination of two aldehydes or ketones to form a β-hydroxyaldehyde or β-hydroxyketone); double-headed arrows represent enolizations (transfer of a proton from an α-carbon to a carbonyl oxygen). The aldotetroses (threose and erythrose) undergo a reverse aldol condensation to yield two molecules of glycoaldehyde. The figure shows D-erythrose as an example of an aldotetrose, but both threose and erythrose can undergo this reaction. Branched-chain and seven-carbon sugars and D- and L-isomers are not shown.

be expected to form (Fig. 1). HCN undergoes a base-catalysed tetramerization reaction to produce diaminomaleonitrile[50], which participates in several interesting chemical reactions, most notably with formamidine to produce 4-aminoimidazole-5-carbonitrile. This leads to the production of adenine, hypoxanthine, guanine, xanthine and diaminopurine[50]. The 4-aminoimidazole-5-carbonitrile intermediate can also be produced directly from diaminomaleonitrile by irradiating with sunlight, so avoiding the use of formamidine which itself must be derived from HCN and NH_3[51].

Diaminomaleonitrile goes on to form higher oligomers of HCN, which appear as a heterogeneous mixture of compounds. Hydrolysis of HCN oligomers yields glycine, alanine, aspartate, diaminosuccinate and smaller amounts of other amino acids[52]. Amino acids have also been synthesized in spark-discharge experiments performed under mildly reducing conditions[53], although the yield and variety of amino acids is substantially lower compared to syntheses performed under strongly reducing conditions. The earliest organisms may have been required to provide their own reducing power, for example using the reduced form of nicotinamide adenine dinucleotide (NAD), NADH, for the biosynthesis of amino acids.

Shifting the focus from HCN to H_2CO, another remarkable polymerization reaction probably took place on the primitive Earth. Accompanying H_2CO would have been smaller amounts of glycoaldehyde, produced either directly or by the condensation of H_2CO in the presence of a catalyst such as calcium carbonate or alumina[54,55]. Glycoaldehyde begins a cascade of aldol condensations and enolizations that rapidly convert most of the available formaldehyde into trioses, tetroses and higher sugars (Fig. 2). This cascade of reactions, collectively termed the formose (or Butlerow) reaction, proceeds autocatalytically because one molecule of threose or erythrose can be cleaved to give two molecules of glycoaldehyde[56]. From a prebiotic perspective, the formose reaction seems a good way to produce ribose and other sugars, although unless they were rapidly used to form nucleosides or some other useful compound, they would have been subject to degradation[57].

The primary structure of RNA. Purine and pyrimidine bases are joined to sugar residues (riboses) to form nucleosides. The purines, adenine and guanine, are attached to ribose by a glycosidic bond between C1′ of ribose and N9 of the base. The pyrimidines, cytosine and uracil, are attached by a bond between C1′ of ribose and N1 of the base. The ribose subunits are joined by a 3′, 5′ phosphodiester linkage to form the ribose–phosphate backbone. Rotation about the glycosidic bond converts the *anti* conformation to the *syn* conformation. Inversion about C1′ would convert the β-conformation to the α-conformation. The numbering schemes for the bases and ribose subunits are shown.

The trouble with RNA

It is a long and difficult road from HCN and H_2CO to the activated nucleoside phosphates that make up RNA (see Box). The self-condensation of HCN to produce purines is such a remarkably simple and efficient reaction that it would be surprising if it did not have some relevance to the early history of life. The prebiotic synthesis of pyrimidines, on the other hand, is more problematic and it is difficult to see how a supply of cytosine or cytosine-containing nucleotides could have been maintained. Cytosine is obtained in about 5% yield when an aqueous solution containing 1.0 M potassium cyanate and 0.1 M cyanoacetylene is incubated at 100 °C for 24 hours[58]. This can hardly be called a prebiotic synthesis because it requires concentrations of reactants that are unlikely to have occurred on the primitive Earth. Cyanoacetylene has been produced by sparking a mixture of CH_4 and N_2 (ref. 58) and presumably could also be obtained from a less reducing mixture. Cyanoacetylene is, however, even more susceptible to hydrolysis than HCN and is unlikely to have built up in significant concentration. There is an alternative route using cyanoacetaldehyde (the first hydrolysis product of cyanoacetylene) and guanidine, although the yields of uracil and, especially, cytosine are low[59]. Furthermore, cytosine would have undergone rapid hydrolysis to uracil (half-life 200 yr at 30 °C)[60]. In contemporary biochemistry, cytidine triphosphate (CTP) is produced by the amination of uridine triphosphate (UTP) in an ATP-dependent reaction.

Another route to the pyrimidines is by acid hydrolysis of HCN oligomers, which can produce 4,5-dihydroxypyrimidine, 5-hydroxyuracil and orotic acid[61]. Orotic acid undergoes a photochemical decarboxylation to give uracil[62], analogous to the enzyme-catalysed decarboxylation that occurs in pyrimidine nucleotide biosynthesis. Uracil can also be produced by condensation of β-alanine and cyanate to give dihydrouracil, followed by photochemical dehydrogenation[63]. Neither of these pathways for the prebiotic synthesis of pyrimidines is especially convincing.

The greatest problem with the pyrimidines is not their synthesis but the difficulty in attaching them to ribose to form pyrimidine nucleosides. First, consider the synthesis of ribose. The formose reaction may offer a good route for the prebiotic synthesis of sugars but it is unclear how ribose could be singled out from the complex mixture of products (Fig. 2). The five-carbon sugars are produced by condensation of glycoaldehyde and glyceraldehyde, accompanied by comparable amounts of tetroses and hexoses produced by the self-condensation of glycoaldehyde and glyceraldehyde, respectively. Even among the pentoses, there are twelve stereoisomers, eight aldoses and four ketoses, to be reckoned with. Perhaps the chemical properties of ribose led to its selective enrichment by some prebiotic fractionation process. The *cis*-(2, 3)-diol structure of ribose and lyxose may have favoured their interaction with a mineral surface where they were relatively protected from hydrolysis compared to arabinose and xylose. The *trans* relationship of the 3-OH and 5-$CH_2OPO_3^{2-}$ groups of ribose-5-phosphate and arabinose-5-phosphate may have rendered them less susceptible to intramolecular cyclization than xylose-5-phosphate and lyxose-5-phosphate[64]. Even if such mechanisms were operating, they would have resulted in a racemic mixture of D- and L-ribose, which still leads to serious difficulties (see below).

Next comes the problem of joining D, L-ribose and a base. When ribose and a purine are heated to dryness in the presence of inorganic salts (Na^+, Mg^{2+}, Ca^{2+}, Cl^- and SO_4^{2-}), a mixture of α- and β-nucleosides is obtained in about 2–10% yield[65]. A comparable reaction between ribose and pyrimidines is very inefficient (<0.1% yield) and no alternative method for the

synthesis of pyrimidine nucleosides has been found. In biological systems, the pyrimidines are attached to ribose by displacement of a pyrophosphate at the C1 position but attempts to perform a similar displacement under plausible prebiotic conditions have been unsuccessful[66]. Even the successful synthesis of purine nucleosides is plagued by side reactions, including the production of ribosylamine derivatives based on the C6-amine of adenine or the C2-amine of guanine. In biological systems, the purine nucleosides are synthesized by constructing the purine base on a pre-existing ribose-5-phosphate. A similar synthesis under prebiotic conditions seems far more difficult than using the purines formed by HCN polymerization and joining them directly to ribose.

At this point, the best possibility is a mixture of α, β-D, L-purine nucleosides accompanied by a dizzying array of related compounds. Now comes the task of phosphorylating the nucleosides. Heating a mixture of urea, ammonium chloride and hydroxylapatite $[Ca_{10}(PO_4)_6(OH)_2]$ to 100 °C for 24 hours results in a good yield of inorganic polyphosphate[67]. If a nucleoside is added to the mixture, about 20–25% of it is converted to a mixture of nucleoside phosphates, including 2′-, 3′-, 2′,3′-cyclic- and 5′-phosphates, and various 2′(3′),5′-diphosphates[68]. Alternative routes using cyanogen or cyanoacetylene rather than high temperature to drive the reaction have been demonstrated[69], although, as already discussed, these condensing agents were probably not widely available on the primitive Earth.

Finally, the nucleoside phosphates must have been activated to provide a substrate for template-directed polymerization. Adenosine 2′, 3′-cyclic phosphate is in a sense already activated; it can be oligomerized by heating it to dryness[70] or by incubating it at room temperature in the presence of a polyamine[71]. Given the proper stereochemical orientation, the 2′, 3′-cyclic phosphate undergoes condensation with an adjacent nucleoside 5′-hydroxyl to produce a 2′, 5′ or 3′, 5′ phosphodiester linkage[72]. This is comparable to the RNA-catalysed ligation reaction that has been demonstrated using the satellite RNA of tobacco ringspot virus[73] or the genomic RNA of hepatitis delta virus[74].

A more practical approach might be to activate a nucleoside 5′-phosphate and take advantage of the greater nucleophilicity of the *cis*-(2′, 3′)-diol compared to the 5′-hydroxyl for the condensation between a 5′-phosphate and 2′(3′)-hydroxyl. Adenosine 5′-phosphate can be converted to the diphosphate and subsequently the triphosphate by incubating it with carbamyl phosphate in the presence of a divalent metal cation[75]. Carbamyl phosphate is itself produced by condensation of cyanate and inorganic phosphate in aqueous solution[76]. Nucleoside 5′-polyphosphates have also been obtained by heating a solution of nucleotides and inorganic polyphosphate to dryness[77].

Could this long and difficult road to activated mononucleotides be travelled without biological catalysts (or an organic chemist) to lead the way? Suppose that somehow it did happen; that given a few hundred million years and an entire globe of microenvironments, there was a special time and place in which a rich soup of activated mononucleotides formed. The only flaw in this hypothetical garden of Eden is that the soup would contain a racemic mixture of D- and L-nucleotides, a necessary consequence of the fact that the prebiotic environment was achiral, which, it turns out, makes RNA replication very difficult. By a strange twist of nucleotide chemistry, D-mononucleotides in the *anti* conformation and L-mononucleotides in the *syn* conformation tend to form very close structural homologues when bound to a complementary template[78] (Fig. 3). As a result, the template-directed synthesis of one enantiomer is strongly inhibited by the presence of the other[79]. The 'wrong' enantiomer adds to the 3′ end of a growing chain, which distorts the 3′ terminus and thus prevents further chain elongation.

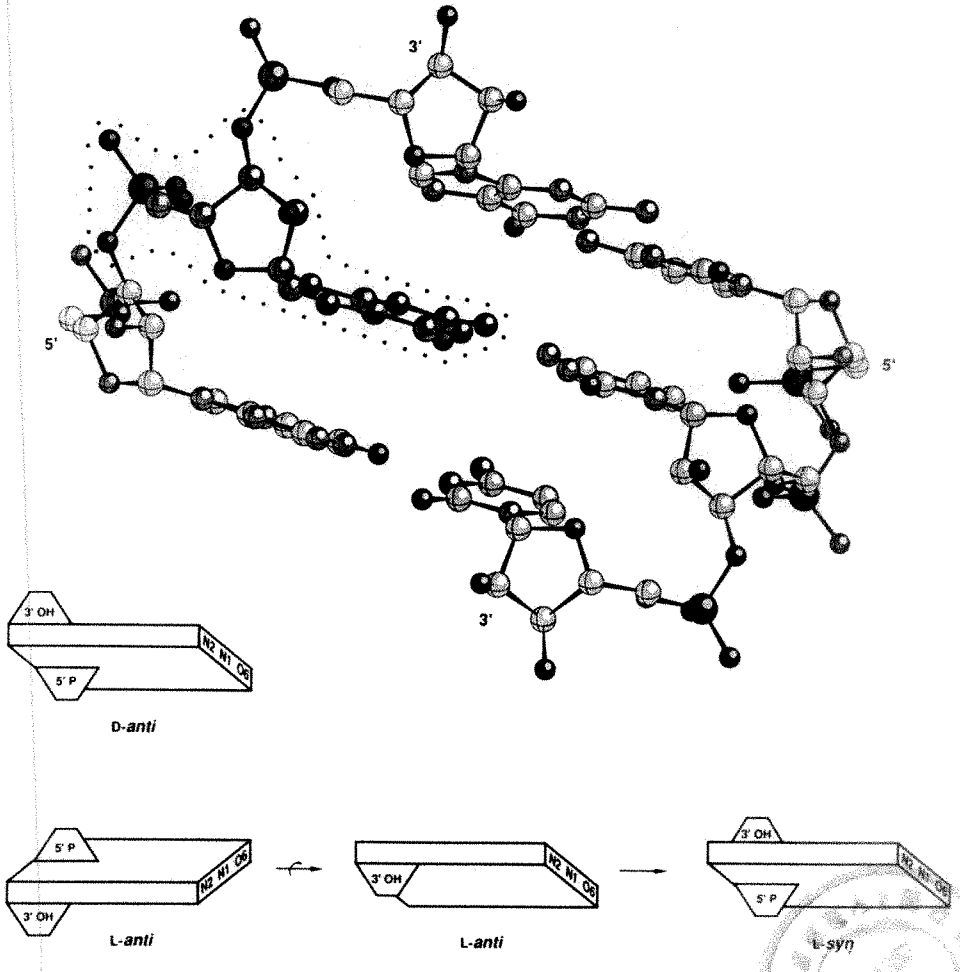

FIG. 3 Top, three successive guanosine · cytosine pairs of the A-form of RNA projected onto a plane perpendicular to the diad axis. The middle guanosine residue is enclosed in a dotted box. Atom coordinates are based on the crystal structure of A-RNA[96]. Graphical representation was performed using *Ball & Stick* software on a Macintosh computer. Bottom, the close structural homology between D-*anti*- and L-*syn*-guanosine mononucleotides when bound to a complementary template. The D-*anti* form corresponds to the middle guanosine residue shown above. Imagine reflecting this in a mirror to produce the L-*anti* form, which is rotated about its long axis to orient the base for complementary pairing and finally rotated about the glycosidic bond to produce the L-*syn* form.

If one admits both α- and β-nucleotides to the hypothetical garden of Eden, another cross-inhibition phenomenon is likely to occur. α-D-mononucleotides in the *syn* conformation and β-D-mononucleotides in the *anti* conformation also form close structural homologues[80] and any combination of α-D-*syn*-, α-L-*anti*, β-D-*anti*-, or β-L-*syn*-mononucleotides is likely to be a problem. The addition of arabinose, other pentoses and the hexoses is an open invitation to template-directed chaos. It is difficult to imagine how a genetic message could be transferred from template to complementary product in the face of all this isomeric interference. The most reasonable interpretation is that life did not start with RNA. The RNA world came into existence after many of the problems associated with the prebiotic synthesis and template-directed replication of RNA had been solved. This implies that there was a simpler genetic system, or systems, that preceded RNA and that evolutionary advances made by the ancestral system were somehow carried over to the RNA world.

The origin of self-replication

We know very little about the chemical nature of the first self-replicating molecule. There are four general requirements for the primordial genetic material, regardless of its chemical nature. First, it must have had informational properties, suggesting that it was some type of heteropolymer, composed of at least two monomeric subunits. Second, it must have been capable of directing the ordered assembly of monomeric starting materials to form additional copies of itself. Third, the monomeric starting materials must have been readily available, at least in some locale on the primitive Earth. Fourth, the genetic material must have been sufficiently stable for its rate of reproduction to exceed its rate of decomposition. If the goal is the eventual origin of an RNA world, then a requirement for an evolutionary pathway from the first self-replicating molecule to a genetic system based on RNA must be added.

There are three ways in which the difficulties in arriving at an RNA world may have been reduced. One is that before the origin of self-replication, there was a period of chemical evolution[81], during which non-instructed processes led to progressive alteration of the chemical composition of the environment. The prebiotic environment can be thought of as a flow reactor, driven by the supply of HCN, H_2CO and other high-energy starting materials, and characterized by a steady-state distribution of reactants and products. In this context, the formose reaction for instance, may not have been quite so unruly; rather than the cascade of all possible 3-, 4-, 5-, 6- and 7-carbon sugars obtained from batch polymerization of H_2CO, there might have been more limited distribution of sugars determined by the differential rates of formation and decomposition of the various compounds[82]. Non-instructed chemical ordering may have led to very complex structures, such as colloidal aggregates of polypeptides[18] and even self-propagating membranous vesicles[83]. These complex structures may have had a profound influence on the local environment and may have set the stage for the emergence of a self-replicating system.

A second possibility is the intervention of a primitive self-replicating system chemically unrelated to RNA, which may have helped to bias the environment in a way that made the appearance of RNA or RNA-like molecules more likely. The most carefully constructed hypothesis along these lines concerns the possibility of self-replicating clay minerals[13], where the genetic material is considered to be a distribution of ionic charges, embedded organic compounds or structural defects along a mineral surface that serves as a template for the formation of additional mineral layers. At one extreme, these clay 'organisms' may have come and gone, leaving their mark by altering the local environment. At the other extreme, they may have developed the capacity to synthesize RNA or RNA-like molecules that were used initially as catalysts or cofactors in the clay world but eventually themselves became self-replicating and took on the role of genetic material[84].

The third advance on the way to an RNA world may have been the appearance of a self-replicating chemical system similar to RNA but simpler in the sense that it demanded less from the chemistry of the prebiotic environment[78,85]. For example, the difficulties associated with the prebiotic synthesis of pyrimidines could be circumvented if the genetic material were based on purines alone. Non-standard pairing combinations such as adenine: inosine, adenine: xanthine and guanine: isoguanine have been suggested[8,86], although there is no experimental evidence that they are suitable for template-directed polymerization. The backbone might have been simpler, with ribose replaced by something that was not accompanied by dozens of closely related compounds or subject to enantiomeric cross-inhibition. A number of flexible, acylic nucleoside analogues that fit this description have been proposed[78,87] (Fig. 4).

The compound that has been studied in the greatest detail is the glycerol-derived nucleoside analogue (compound *b* in Fig. 4). In principle, it could be synthesized by condensation of H_2CO and glycerol followed by addition of a base. This should produce a mixture of various mono- and di-substituted glycerol derivatives but this would be far simpler than the assortment of ribosyl- and other sugar derivatives that would accompany a nucleoside. This compound, either non-phosphorylated or phosphorylated at both hydroxyl positions, is an achiral molecule. It becomes chiral when incorporated into a heteropolymeric structure. The glycerol-derived analogue of guanosine bisphosphate, when activated at both phosphates, undergoes a poly(C)-directed oligomerization reaction to form pyrophosphate-linked products[88]. A pyrophosphate-linked oligomer formed from deoxycytidine bisphosphate has also been used as a template to direct the oligomerization of deoxyguanosine bisphosphate derivatives (A. W. Schwartz, personal communication). Thus there could have been a genetic molecule with a glycerol-phosphate backbone that replicated by a chemical process and was able to undergo darwinian evolution.

Chemical self-replication, in the glycerol-phosphate system or in any RNA-like system, faces several obstacles. One of the most serious is the need for end-to-end copying of the template before the development of a mechanism to ensure that replica-

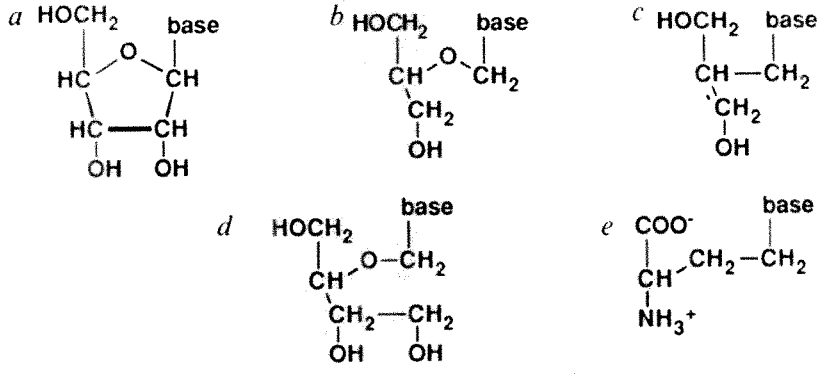

FIG. 4 Comparative structure of a nucleoside and of four simple acyclic nucleoside analogues. *a*, nucleoside; *b*, glycerol-derived acyclonucleoside; *c*, acrolein-derived nucleoside analogue; *d*, erythritol-derived acyclonucleoside; *e*, aspartate-derived nucleoside analogue.

tion begins at a discrete initiation site. In the RNA world this problem may have been solved by a 'genomic-tag' structure that directed a primitive replicase to the appropriate initiation site[89]. In the early stages of self-replication, a chemical tag could have demarcated one end of the template or a chemical ligation mechanism could have joined partial copies together to form complete products.

Another important obstacle to chemical self-replication, which has been demonstrated in experimental systems, is the tendency of molecules with regions of self-complementarity to form intramolecular duplex structures[90]. It is difficult to envisage a solution to this problem in the absence of a factor such as single-strand binding proteins, because the conditions must favour short duplex regions so that template-directed synthesis can occur yet disfavour long duplex regions that would produce stable secondary structures. There may be alternative helical backbones that have non-cooperative properties so that longer duplex structures are increasingly disfavoured[78]. In any event, the development of an unwinding activity would have been a top priority during early evolutionary history.

Finally, there is the problem of accurate copying of the genetic information in the absence of a sophisticated replicase enzyme. The selectivity of complementary base pairing provides the chemical basis for information transfer, with the fidelity depending on the particular bases involved (highest for cytosine→guanine, lowest for adenine→uracil)[91]. The efficiency of copying also depends on base sequence, with selection pressure favouring those sequences that can be copied most readily. One of the tasks of a polymerase enzyme is to 'smooth' these differences so that a broader range of sequences can be explored[92]. But given the limits on genome size (as determined by copying fidelity[29]) and on sequence heterogeneity, would there have been enough potential sequences remaining to evolve a smoothing function that could further expand the range of potential sequences? A crude replicase activity must have arisen so that copying fidelity could be improved, genome size could be increased and ever more sophisticated catalysts could be developed.

Transition to an RNA world

Let us suppose that after a period of chemical evolution, with or without further augmentation by a genetic system completely unrelated to RNA, a genetic system arose based on some simple RNA-like molecule. It is not inconceivable that a genetic system completely unrelated to RNA would have invented RNA for its own purposes. With so many design problems associated with RNA synthesis, it seems more likely that a simple RNA-like molecule was invented instead. Once a genetic system based on an RNA-like molecule existed, the domain of nucleotide chemistry would have been more accessible and the invention of RNA would have been more practical. Why should an increasingly sophisticated RNA-like world come to synthesize mononucleotides rather than optimize the synthesis of its own monomeric units? The answer must be that mononucleotides somehow conferred a selective advantage to the RNA-like world, either by improving its information storage properties or by enhancing its catalytic abilities.

Reviewing the catalytic properties of known RNA enzymes[93], RNA catalysis seems to be limited to sequence-specific cleavage/ligation reactions involving nucleic acid substrates. But the chemical properties of the various functional groups within RNA suggest a broader range of catalytic function (Table 2). Of particular importance to RNA, but not to any of its likely predecessors, is the ribose 2′ hydroxyl. A terminal *cis*-(2′, 3′)-diol is a good nucleophile and an internal 2′-hydroxyl can function either as a nucleophile[22] or as a determinant of RNA tertiary structure[94,95]. Because of the 2′-hydroxyl, RNA may have enhanced the structural and catalytic properties of the RNA-like world and its production could have been a favourable event.

We do not know how the transition from an RNA-like to an RNA world was made. There are several ways in which RNA may have gained entry. One is that nucleotides or nucleotide derivatives were generated to perform some useful function in the RNA-like world and then took root as cofactors in primitive metabolic processes. The RNA cofactors progressed from monomeric to oligomeric forms and eventually became autonomously self-replicating. Another possibility is that mononucleotides were at first inadvertently incorporated into the ancestral genetic material but this proved selectively advantageous. It is not clear how random misincorporations could have been useful or how the incorporation of mononucleotides could have been limited to specific sites. Somehow the genetic material took on more and more of the character of RNA without forsaking its past evolutionary accomplishments. A third possibility is that mononucleotides, originally present as cofactors, became oligomerized in a template-dependent way to give products that contained only RNA components. The ancestral genetic material directed both its own replication and the 'transcription' of RNA. RNA became autonomously self-replicating and either shed its RNA-like predecessor or, through reverse transcription, replaced the predecessor with DNA.

The transition to an RNA world, like the origins of life in general, is fraught with uncertainty and is plagued by a lack of relevant experimental data. Researchers into the origins of life have grown accustomed to the level of frustration in these problems. Perhaps it is time for a new group of scientists to join in the frustration. The discovery of catalytic RNA and the appreciation of the dual role of RNA as both genetic material and catalyst have kindled new interest in the evolution of RNA and the origins of life. It is time to go beyond talking about an RNA world and begin to put the evolution of RNA in the context of the chemistry that came before it and the biology that followed. □

TABLE 2 Catalytic potential of RNA

Component	Metal-ion coordination	General acid catalysis	General base catalysis	Nucleophile
Ribose	2′OH			2′OH, 2′(3′)-diol
Phosphate	O^-	OH	O^-	
Adenine	N7		N1	
Guanine	N7	N1	N7	
Cytosine	N3		N3	
Uracil	O2	N3

One very simple decision will carry your research into the next century.

It's this simple.

Subscribe to *Current Contents on Diskette*, and the way you look at the biomedical literature will never be the same.

With mere keystrokes or clicks of a mouse, you'll scan the tables of contents of the world's most important journals ... electronically.

Another command and you're exporting bibliographic data to your personal database. Or creating custom search profiles using key terms, authors, or the names of institutions.

Unmatched coverage.

The J-1200 Edition covers over 1200 journals; the J-600 includes more than 600 of the highest-impact publications. If you like, you can combine either edition with a yearly subscription to the print *Current Contents®/Life Sciences* — and receive a substantial discount.

Automatic reprint requests.

Current Contents on Diskette fills in the appropriate information right on special ISI *Request-A-Print®* forms. It also lets you generate orders for *The Genuine Article®*, ISI's 48-hour (or faster) document delivery service. Reprints the way you want them — fast and easy.

The system is available for IBM, 100% compatibles, and Apple Macintosh.

To subscribe, or to request an information pack, call **800-523-1850, ext. 1483.** Or write the ISI branch nearest you.

The decision is simple, but the rewards are far-reaching.

CURRENT CONTENTS *on Diskette™*

A total information system—
and your weekly connection to the life sciences literature of the world.

NEW BOOKS AND JOURNALS IN THE PERGAMON

COMPREHENSIVE MEDICINAL CHEMISTRY

The Rational Design, Mechanistic Study and Therapeutic Application of Chemical Compounds

To Be Published in 6 Volumes

Editorial Board:
C Hansch, *Pomona College, Claremont, CA, USA* (Chairman)
J C Emmett, *Smith Kline & French, Welwyn, UK*
P D Kennewell, *Roussel Laboratories, Swindon, UK*
C A Ramsden, *Rhône-Poulenc, Dagenham, UK*
P G Sammes, *Smith Kline & French, Welwyn, UK* (Joint Executive Editor)
J B Taylor, *Rhône-Poulenc, Dagenham, UK* (Joint Executive Editor)

0 08 032530 0 Hardcover 6 Volume Set
Further details (including price) to be announced.
Due Dec 1989

- The most up-to-date, authoritative and complex work of reference ever published on the design, study and application of pharmaceutical compounds
- Supplied complete in six volumes in the second half of 1989
- Over 5000 large format pages containing clearly presented material and extensively illustrated
- Written by over 150 internationally recognized contributors from 15 countries
- Provides essential information for libraries serving chemists and biologists in both academic and industrial research or in teaching
- Covers general topics, enzymes and other molecular targets, membranes and receptors, quantitative drug design, and biopharmaceutics in full detail
- Includes a unique compendium of drug information covering over 5000 compounds

ALLERGY AND MOLECULAR BIOLOGY

Proceedings of the International Symposium on Allergy and Molecular Biology, Laguna Niguel, California, USA, 11 - 12 April 1988

Edited by:
A Said El Shami, *Diagnostic Products Corporation, 5700 West 96th Street, Los Angeles, CA 90045, USA* and **T G Merrett,** *Allergy Unit, Benenden Chest Hospital, Cranbrook, Kent TN17 4AX*

444 pp 91 line drawings 24 halftones 1000 lit refs
0 08 036883 2 Hardcover **US$123.00** due Jan 1989

Also sold as *Advances in the Biosciences* Volume 74 and supplied to subscribers as part of their subscription.

The First International Symposium on Allergy and Molecular Biology, sponsored by the Diagnostic Products Corporation, took place in California, April 1988. The state-of-the-art technology in allergy research was discussed and the stage was set for future developments in allergy testing, diagnosis and treatment. Advances in molecular biology and immunology are now being utilized to elucidate the nature of allergy and its clinical manifestations at the molecular level. This will ultimately provide the scientific basis for the effective therapeutic treatment and management of allergenic conditions. The text is divided into sessions based on the organization of the Symposium. Each session is supported by tables, diagrams, photographs and a concluding discussion section.

PHARMACOLOGICAL SCIENCES FROM PRESS

PROGRESS IN GROWTH FACTOR RESEARCH

Executive Editor: **J K Heath.** *Department of Biochemistry, University of Oxford, South Parks Road, Oxford OX1 3QU, UK*

This journal features timely and authoritative reviews of current research and applications on growth factors and related regulatory peptides. The scope of the journal encompasses the structure and biological properties of growth factors, the structure and function of their receptors and signalling oncogenes, signal transduction pathways and effector systems, and regulation of gene expression. *Progress in Growth Factor Research* also aims to cover the role of growth factors in biological processes such as development, tissue repair and regeneration, and reflect advances in therapeutic applications of growth factor research in human and veterinary medicine. The review articles are commissioned from leading researchers and will be of value to all biomedical workers seeking to keep abreast of this rapidly expanding field.

Subscription Information

CELLULAR SIGNALLING

Editor-in-Chief: **M D Houslay.** *Molecular Pharmacology Group, Institute of Biochemistry, The University of Glasgow, Glasgow G12 8QQ, Scotland, UK*

Cellular Signalling publishes original papers covering all aspects of mechanisms, actions and structural components of cellular signalling systems. The emphasis is on the production, regulation, degradation and action of second messengers; the structure, regulation and action of receptors; guanine nucleotide regulatory proteins; effector systems, such as tyrosyl kinases, adenylate and guanylate cyclase and ion channels; the effect of cellular signalling events on the functioning, growth and differentiation of target cells in normal and pathological states and also cellular oncogenes.

Within the scope of the journal, manuscripts dealing with biochemistry, cell biology, molecular biology, pharmacology, neurobiology, molecular endocrinology and molecular oncology will be welcomed. The journal will also publish short original reviews on topical subjects.

Subscription Information
1989: Volume 1 (6 issues)
Annual subscription (1989) **US$210.00**
ISSN: 0898-6568.

Prices apply to North, Central and South America only. For subscription information outside the Americas, and Sterling book prices, please contact your nearest Pergamon office. Prices and proposed publication dates are subject to change without prior notice.

ELECTRON MICROSCOPY REVIEWS

Editor-in-Chief: **J R Harris.** *North East Thames Regional Transfusion Centre, Crescent Drive, Brentwood, Essex CM15 8DP, UK*
Associate Editors: **R W Horne.** *School of Biological Sciences, University of East Anglia, Norwich NR4 7TJ, UK* and **W Chiu.** *Department of Biochemistry, One Baylor Plaza, Houston, Texas 770306, USA*

Electron Microscopy Reviews provides critical, up-to-date reviews of new developments in the field of transmission and scanning transmission electron microscopy of subcellular organelles, membrane fractions, macromolecules and macromolecular assemblies from animal, plant, fungal and bacterial cells. Also included will be extracellular proteins and supportive structures, together with viral particles and their components. Emphasis is to be placed upon results and applications together with methodology. Reviews which include high resolution studies leading to two- and three- dimensional image analysis and reconstruction are particularly welcomed.

The journal will publish material of the highest quality which has undergone strict editorial control by a thoroughly international Editorial Board. The production of all electron micrographs will be of a consistently high standard.

Subscription Information
1989: Volume 2 (2 issues)
Annual subscription (1989) **US$130.00**
ISSN: 0892-0354.

Churchill Livingstone

ANNOUNCEMENT AND CALL FOR PAPERS

LITHIUM

This new journal will publish selected high quality articles on all biomedical aspects of lithium, i.e. biochemical, physiological, pharmacological, psychopharmacological and clinical. The aim of **Lithium** is to provide a single outlet for these varied research themes, and so to unify the subject of lithium research and therapy. Published articles will represent important new directions in the study of biological effects of lithium.

The journal will accept substantial research reports, short communications, review articles, letters to the Editor, and articles propounding new theoretical positions. There will also be a bibliography of recent articles on lithium.

Lithium will be of primary importance to psychiatrists, biochemists and pharmacologists, and will also be of interest to physiologists, pharmacists, endocrinologists, and virologists.

Editor:
F N Johnson, Dept of Psychology, University of Lancaster, Bailrigg, Lancaster LA1 4YF, UK.

Associate Editors:
N J Birch (UK); P Goodnick (USA); J W Jefferson (USA); A Koukopoulos (Italy); H Loo (France); P Vestergaard (Denmark); S Watanabe (Japan).

Editorial Advisory Board:
M Abou-Saleh (UK); S Christensen (Denmark); H Dufour (Switzerland); R Fieve (USA); V Gallicchio (USA); W Greil (FRG); P Grof (Canada); D Hart (Canada); G Hines (USA); D Horrobin (UK); G Johnson (Australia); B Müller-Oerlinghausen (FRG); P Perry (USA); P Plenge (Denmark); J Rybakowsky (Poland); M Schou (Denmark); Yan Shan-Ming (Peoples' Republic of China); K Thomsen (Denmark); S Tyrer (UK); T A Wehr (USA).

Papers:
Original papers, or "rapid communications" should be sent to the Editor.

Publication:
The journal will be published quarterly. First Issue: March 1990.

Further Information:
Requests for further information or subscription details should be sent to:
Churchill Livingstone Medical Journals, Robert Stevenson House, 1-3 Baxter's Place, Leith Walk, Edinburgh EH1 3AF, UK.

☐ Please send me subscription information on **LITHIUM**

☐ Please send me a free sample copy of **LITHIUM** when it is available.

Managing references just got easier.

Stop filing index cards and misplacing references! Organize them instead, with a specially designed database pro-gram called Pro-Cite®. Pro-Cite makes it easy to manage references. Now you can sort, search, or index references from journal articles, books, or any other source. Keep references organized, include long abstracts or notes, and format bibliographies in any style.

Pro-Cite puts references in order.

Call (313) 996-1580 today. Pro-Cite is available for IBM® PCs and the Macintosh® and the programs are data compatible. Other PBS products include Biblio-Links™ (companion programs that transfer records into Pro-Cite) and Pro-Search™ (a specialized communications program for searching BRS and DIALOG (IBM only)). Pro-Cite is now NOT copy protected.

The most accurate and up-to-date guide to the status and development of human therapeutic proteins . . .

Genetically Engineered Human Therapeutic Drugs

D. Copsey and S.Y.J. Delnatte, *Pantech Partners*

Genetically Engineered Human Therapeutic Drugs is a comprehensive reference source that provides up-to-date information on human therapeutic proteins in a convenient, logically organized format. Based on evidence from clinical studies reported in the academic, clinical and biological research journals, the information provided in this work is among the most accurate and objective information available.

PART I: Clinical Drug Development
Part I consists of reviews of 77 proteins under 18 therapeutic categories. These reviews examine the clinical research being undertaken in the major unsatisfied therapeutic areas. Where available, each review provides information on: Therapeutic Indications • Clinical Research Background • Clinical Studies.

PART II: Commerical Drug Development
Part II examines 90 proteins under 25 therapeutic categories currently being developed for their commercial potential as therapeutic drugs. It is organized alphabetically by generic rDNA protein. Following the introductory section for each protein, are tables organized by stage of development: Launched Products • Registered / Approved Products (Not yet launched) • Products in Clinical Trials • Products in Research or Pre-Clinical Development • Products under Clinical Agreements

M

Structure of tumour necrosis factor

E. Y. Jones*, D. I. Stuart* & N. P. C. Walker†

*Laboratory of Molecular Biophysics, The Rex Richards Building, South Parks Road, Oxford OX1 3QU, UK
†Hauptlaboratorium, BASF Aktiengesellschaft, Carl-Bosch-Str. 38, 6700 Ludwigshafen/Rh., FRG

Tumour necrosis factor is a trimeric molecule, each subunit of which consists of an antiparallel β-sandwich. Individual subunits form the trimer by a novel edge-to-face packing of β-sheets. A comparison of the subunit fold with that of other proteins reveals a remarkable similarity to the 'jelly-roll' structural motif characteristic of viral coat proteins.

TUMOUR necrosis factor (TNF) plays a key role as a polypeptide mediator of inflammation and the cellular immune response. It is secreted by macrophages and is a member of the class of molecules termed cytokines, a group which includes the interferons and interleukins. These hormones form a complex network of interactive signals that regulate their own production and the growth and differentiation of cells involved in inflammation, immunity and haemopoiesis[1]. TNF was first characterized by its *in vivo* antitumour properties and *in vitro* cytotoxicity to certain transformed cell lines[2]. Lipopolysaccharide (LPS) is a potent trigger for TNF production[3,4] and the effects of LPS such as fever and shock seem to be mediated by TNF. TNF also displays antiviral activity[5,6] and plays a protective role in malarial infections[7]. Conversely, it is implicated in the pathogenesis of cachexia (wasting)[4], rheumatoid arthritis and inflammatory tissue destruction[8,9].

TNF is secreted as an unglycosylated 157-amino-acid polypeptide of relative molecular mass (M_r) 17,350 (17 K). Its primary structure is evolutionarily conserved[10], and in its active form the protein is thought to be trimeric[11]. TNF binds to a receptor, believed to be a glycoprotein of $M_r \sim 75$ K[11-17].

We report here the determination of the structure of the TNF trimer at 2.9 Å resolution by X-ray crystallography. The main-chain fold of a TNF subunit shows a remarkable similarity to the 'jelly-roll' structural motif of viral capsid proteins, making it unique among known non-viral proteins.

Structure determination

Material of high purity was obtained from the recombinant human TNF gene expressed in *Escherichia coli* as the 17 K protein. Crystals of TNF grew by vapour diffusion as hexagonal rods ($0.5 \times 0.5 \times 1.5$ mm) from ammonium sulphate solution at room temperature (N.P.C.W. and S. Marcinowski, unpublished observations). The crystals belong to the trigonal space group $P3_121$ with unit cell dimensions $a = b = 166$ Å, $c = 93$ Å and diffract to 2.9 Å resolution. Crystal density measurements using the Ficoll density gradient method indicated that the asymmetric unit probably contained two trimers; the crystal solvent content was therefore 65%.

Data were generated and collected using synchrotron radiation at the SERC Daresbury Laboratory and a Xentronics multiwire area detector at Oxford (Table 1). The presence of six subunits of unknown orientation within the asymmetric unit made the solution of heavy atom derivatives problematic; self-rotation function calculations failed to locate the non-crystallographic 3-fold axes of the two trimers. Analysis of difference Patterson maps for putative heavy-atom derivatives was undertaken using programs (GROPAT) written specifically for this project (E.Y.J. and D.I.S., manuscript in preparation). This analysis provided the heavy atom positions for an $Hg(CH_3CO_2)_2$ derivative that had one heavy-atom site per subunit. Difference Fouriers then revealed two other usable multiple site derivatives of poorer quality. Phasing statistics are given in Table 1.

Solvent flattening was applied to the three 6 Å SIR maps for these derivatives, in turn, and a 'best' map was then produced as a weighted average of these. From this starting point, gradual and very careful phase extension to 4 Å was carried out using phase information from the first derivative combined with solvent flattening. Beyond 4 Å no phase information was available from the heavy-atom derivatives. Further phase extension was achieved by solvent flattening and averaging using the Bricogne algorithms[19]. We performed 3-fold averaging separately about the two trimers. After initial cycling at 4 Å, very gradual phase extension to the limit of the native data, 2.9 Å, was carried out. Although the positions of both non-crystallographic 3-fold axes refined satisfactorily, one of the two trimers (the second) showed significantly poorer averaging statistics. After cycling to convergence at 2.8 Å, it was decided to remove the constraint of 3-fold averaging for the second trimer and continue with this modified cycle of partial averaging and solvent flattening. Surprisingly, this gave electron density of an improved quality for both trimers. Averaging and phase extension statistics are given in Table 1.

An unambiguous chain trace was quickly established for one of the three subunits of trimer one, and confirmed by fitting the amino-acid sequence. Apart from two regions of high mobility there are no main-chain breaks, side-chain density is well defined, and a high percentage of main-chain carbonyl bulges are visible. A representative portion of the map is shown in Fig. 1. The final model comprises 153 residues and is complete but for the first 4 N-terminal amino acids for which clear electron density is not visible. The structure has now been refined using X-PLOR[20] on a CONVEX C210. The R-factor is at present 22.2% (on all data from 6 to 2.9 Å) after restrained B-factor refinement with excellent stereochemistry (r.m.s. deviation from

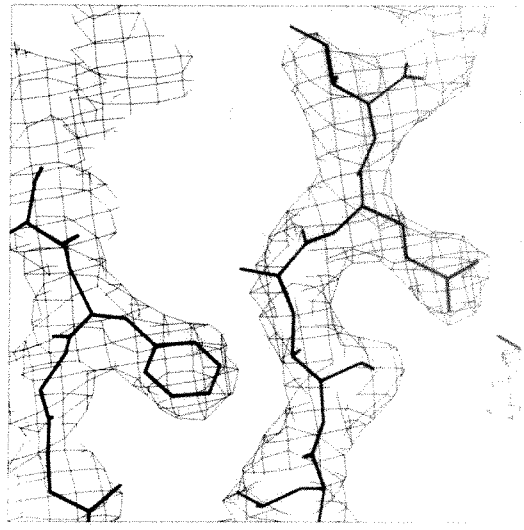

FIG. 1 Portion of the electron-density map (before refinement) viewed edge-on to the β-sandwich. Phe 152 in β-strand I and Glu 135 in β-strand H are shown in the centre of the figure. Electron density contoured at an arbitrary level is represented by chicken wire.

ideal bond lengths of 0.013 Å) and no model for the solvent structure.

Description of the structure

TNF is a compact trimer composed of 3 identical subunits of 157 amino acids (Fig. 2). The overall shape of the monomeric subunit is wedge-like with length 50 Å and maximum breadth 30 Å. It is essentially a β-sandwich structure formed by two antiparallel β-pleated sheets and has the topology of the classic viral jelly-roll motif (Fig. 3*a*). The upper sheet (sheet 1) is kinked with three long strands supplemented for half the sheet by a loop of two additional strands. The lower sheet (sheet 2) comprises five strands of steadily decreasing length. The middle strand of this sheet consists of the last nine C-terminal residues; the C terminus is thus firmly locked into position. By contrast, the flexible N-terminal region runs past a neighbouring subunit in the trimer before the chain is incorporated into the protein core as a β-strand in sheet 2. It has previously been concluded[4] that the complete carboxy-terminal sequence is essential for bioactivity, whereas amino-terminal deletions of up to eight residues may be sustained without loss of bioactivity. This is consistent with the maintenance of structural integrity in sheet 2. The single disulphide bridge (residues 69 and 101) stretches between the two longest intersheet loops. This region (in particular residues 102–113 in the larger of these loops) comprises the other area of high main-chain mobility.

The subunits associate tightly about the 3-fold to form a compact conical-shaped trimer of length 50 Å and maximum breadth 45 Å. The interaction is through a simple edge-to-face packing of the β-sandwich (Fig. 2*b*). The edge of the β-sandwich consisting of strands F and G from one subunit lies across sheet 2 of a 3-fold related subunit. The carboxy terminus lies close to the 3-fold axis. The subunit β-sandwich has the expected filling of tightly intercalating large apolar residues. The outer surface of the trimer, mainly comprising the outerside of sheet 1, is decorated with charged and polar side-chains. The remaining face, that of sheet 2 which mediates the 3-fold edge-to-face interaction, is predominantly polar in character.

Structural homology

The connectivity for the standard eight strands of the viral jelly-roll motif and the equivalent elements of secondary structure in the TNF subunit is identical. A series of comparisons between TNF and other β-barrel proteins has been carried

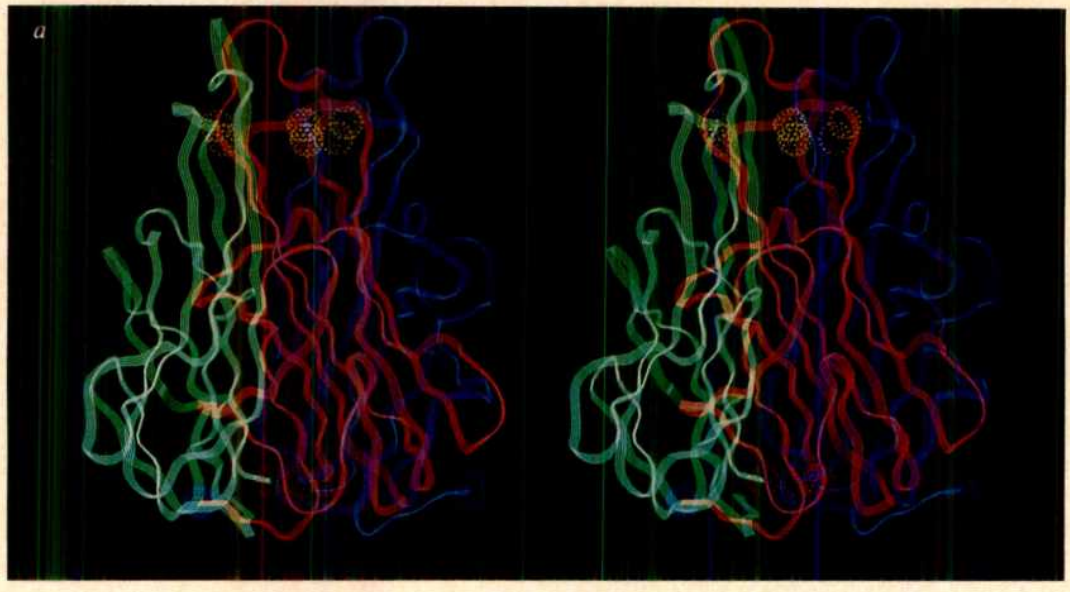

FIG. 2 *a*, Ribbon representation of the trimer with the 3-fold axis vertical. Individual subunits are colour-coded blue, green and red. N termini are marked by blue spheres and C termini by red. Yellow spheres near the top of the molecule indicate the disulphide bridges. *b*, Edge-to-face packing of the monomers in the TNF trimer. The view is down the 3-fold axis showing a narrow slab of the trimer with β-strands running into and out of the page.

out using SHP[21], a program which allows automatic definition of the 'equivalent' residues based on superposition of C_α positions.

Foot and mouth disease virus (FMDV) provides an example of the degree of structural homology found between the capsid proteins VP1, VP2 and VP3 of a picornavirus[22]. Typically 60–70% of the residues are matched with r.m.s. deviations of up to 3.2 Å. The immunoglobulin domain is also an antiparallel β-sandwich but with a totally different connectivity; a comparison of this motif with the jelly-roll fold of FMDV VP3 yields significantly lower values with only about 30% of the VP3 residues matched with r.m.s. deviations of 3.7–4.0 Å. These two results provide useful benchmarks when considering the data for TNF. For a non-jelly-roll β-barrel structure the number of equivalenced TNF residues varies from about 40 to 50% with r.m.s. deviations of between 3.5–4.0 Å. Concanavalin A[23] is an intermediate structure, a considerable portion of this more elaborate molecule can be matched to the viral fold[24]. This is reflected in the comparison with TNF, for which 64% of the residues of TNF can be matched but with a large r.m.s. deviation of 4.04 Å. The number of equivalenced TNF residues is consistently in excess of 60% with r.m.s. values frequently below 3.5 Å when matched against structures with the jelly-roll motif. Several such comparisons are particularly noteworthy. The structural similarity between TNF and the jelly-roll domain of influenza haemagglutinin (HA)[25] is as close as that between HA and FMDV VP3. In the case of two viral capsids, tomato bushy stunt virus (TBSV)[26] and adenovirus hexon[27], a pair of jelly-roll structures have been found on the same polypeptide chain, presumably as a result of gene duplication. In both cases, TNF is at least as similar to one jelly roll as the two jelly rolls are to each other. The most striking similarity, however, occurs between TNF and satellite tobacco necrosis virus (STNV),[28] a very simple $T = 1$ plant virus. 71% of TNF residues can be equivalenced to residues in STNV with only 3.3 Å r.m.s. deviation (Fig. 3*b*). Thus TNF is structurally as similar to STNV as this protein is to other viral coat proteins.

The structural similarity between the capsid proteins of the small spherical plant viruses, and subsequently the picornaviruses, has been taken to indicate a common evolutionary precursor[29,30]. The structural similarity described here points to the divergent evolution of TNF and the viral proteins from a common ancestral jelly-roll protein. The identification of additional common characters adds weight to this hypothesis. First, the solvent-accessible outside face in the TNF trimer and in the viral capsid are equivalent. Second, the packing of jelly rolls in the capsid of adenovirus is reminiscent of the TNF trimer. The adenovirus hexon[27] contains two jelly-roll domains (P1 and P2) which pack about a quasi 6-fold axis in the hexon. The adenovirus capsid is constructed out of these hexagonal plates such that copies of P1 or P2 from three plates lock into a 3-fold arrangement about each corner of the hexon. Unlike the case in picornaviruses, the longest axis of the β-barrel is roughly normal to the adenovirus surface; hence these 3-fold clusters of P1 or P2 and the TNF trimer have a common general mode of packing. The versatility of the basic jelly-roll motif in fulfilling

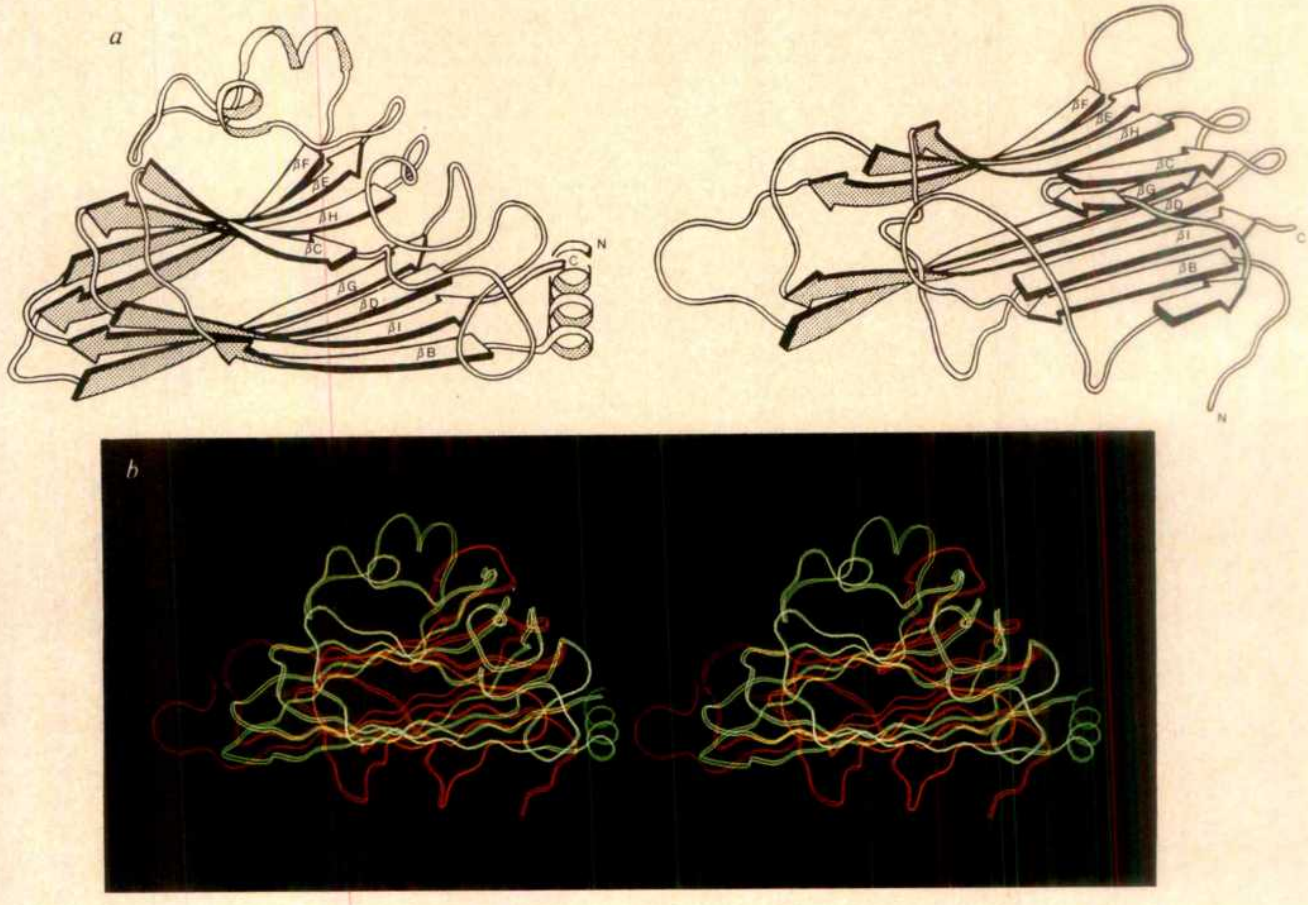

FIG. 3 *a*, Diagrammatic sketch of the polypeptide fold for STNV (top) and TNF (bottom). The β-strands are shown as thick arrows in the amino-to-carboxy direction and are labelled according to the viral convention. An insertion in TNF results in severe truncation of the N-terminal half of β-strand C and addition of short, extra β-strands to the outer edges of both upper and lower sheets. The TNF trimer 3-fold axis would be horizontal in this orientation. *b*, Superposition of ribbon representations for STNV (green) and TNF (red). The upper β-sheet forms the solvent-accessible surface in both cases.

Film data were collected on 2° oscillation photographs (3.4 Å resolution) or 1° oscillation photographs (2.9 Å resolution), processed and scaled using standard programs[21]. The data sets collected on the Xentronics area detector (XEN) were taken as 0.2° oscillation frames and processed using the XENGEN program package (A. Howard, XENGEN manual). About 20 heavy-atom compounds were screened for isomorphous derivatives, complete data sets were collected for 15 of these, of which 3 yielded usable data. FHA, heavy-atom structure factor; ETOT, residual lack of closure; FM, figure of merit. Phasing statistics were obtained before any phase modification by solvent flattening. Wang *R*-factor, the crystallographic *R*-factor between observed structure factor amplitudes and those calculated from the solvent flattened map ($R = \sum |(|F_o| - |F_c|)|/\sum |F_o|$). Averaging *R*-factor, the crystallographic *R*-factor between observed structure factor amplitudes and structure factor amplitudes calculated from the averaged and solvent flattened map. Real space *R*-factor, the *R*-factor between non-crystallographically related electron density. Correlation coefficient, $C = \sum (\langle F_h \rangle - |F_o|)(\langle F_h \rangle - |F_c|)/[\sum (\langle F_h \rangle - |F_o|)^2 (\langle F_h \rangle - |F_c|)^2]^{1/2}$, where $|F_o|$ and $|F_c|$ are observed and calculated structure factor amplitudes placed on the same relative scale for each resolution shell, and $\langle F_h \rangle$ is the mean observed amplitude in that shell. TR1, first trimer. TR2, second trimer.

very different packing criteria has been commented on previously[24,27].

Conclusions

The structures of three cytokines have so far been established: interleukin-2 (ref. 31), interleukin-1β (ref. 32), and now TNF. Each has a different structural motif. Thus the overlapping biological roles of these molecules are not reflected in their overall structures.

TNF is the first non-viral protein to contain the classic jelly-roll motif. It is a compact molecule shorn of most of the insertions which decorate the jelly roll in the typical viral protein. The basic antiparallel β-sandwich of the jelly roll provides a very stable core arrangement of secondary structure from which connecting loops can provide a myriad of structural variations, a similar principle to that used by the topologically distinct immunoglobulin superfamily. One reason for TNF's rather austere jelly roll could be that it has no need of great variability as it is not seeking to evade host surveillance. Similarly the STNV coat protein is free from the pressures of escaping an immune system and the more demanding packing requirements associated with the conformational switching of more complex viruses. Hence the greatest similarity occurs between TNF and the coat protein of the simplest of the spherical plant viruses.

If one accepts the case for divergent evolution then our observation accords with the hypothesis of Rossmann *et al.*[30] that the viral jelly roll originated from a non-viral receptor binding protein. This homology may in the future provide insight into the functional relationships of these diverse proteins. Our present knowledge suggests that a crucial event in the origins of at least a major class of viruses was the acquisition of the ability to assemble a stable protein shell from subunits based on the jelly-roll motif. It may well be that with the structure of TNF we can start to piece together these origins. □

A laminin-like adhesive protein concentrated in the synaptic cleft of the neuromuscular junction

Dale D. Hunter, Vandana Shah*, John P. Merlie* & Joshua R. Sanes

Departments of Anatomy and Neurobiology and * Pharmacology, Washington University School of Medicine, 660 South Euclid Avenue, St Louis, Missouri 63110, USA

A striking example of topographic specificity in synapse formation is the preferential reinnervation of original synaptic sites on denervated muscle fibres by regenerating motor axons. This specificity is mediated by the basal lamina of the synaptic cleft. A glycoprotein, s-laminin, has now been identified that is selectively associated with synaptic basal lamina and is recognized by motoneurons. Molecular cloning reveals that s-laminin is a novel homologue of laminin, a potent promoter of neurite outgrowth.

IN most vertebrate skeletal muscles, each muscle fibre is innervated at a single site by a single motor axon. Injuring the motor nerve leaves the muscle denervated, but axons can regenerate to form new neuromuscular junctions that resemble their normal counterparts in structure and function. A striking and consistent feature of reinnervation is that it is topographically specific: axons preferentially form new junctions at original synaptic sites[1-3]. The fidelity of this process—in some cases more than 95% of the regenerated synapses form on the ~0.1% of the muscle fibre surface that was originally synaptic[3]—indicates that there are factors closely associated with original synaptic sites that axons recognize.

We have shown previously that some of these factors are associated with the basal lamina (BL) that ensheathes each muscle fibre and passes through the synaptic cleft at the neuromuscular junction[3,4]. Subsequently, we[5,6] and others[7,8] generated antibodies that selectively stained synaptic sites on muscle fibre BL, revealing molecular correlates of the functional specialization demonstrable during reinnervation. Here, we identify one such synaptic antigen as a novel homologue of laminin, a glycoprotein of the BL already known to be adhesive for neurons[9]. Because the distribution of this laminin-like protein is restricted to a subset of BLs, including synaptic BL, we call it s-laminin. Its location, bioactivity and resemblance to laminin suggest that s-laminin is involved in the formation or stabilization of synapses.

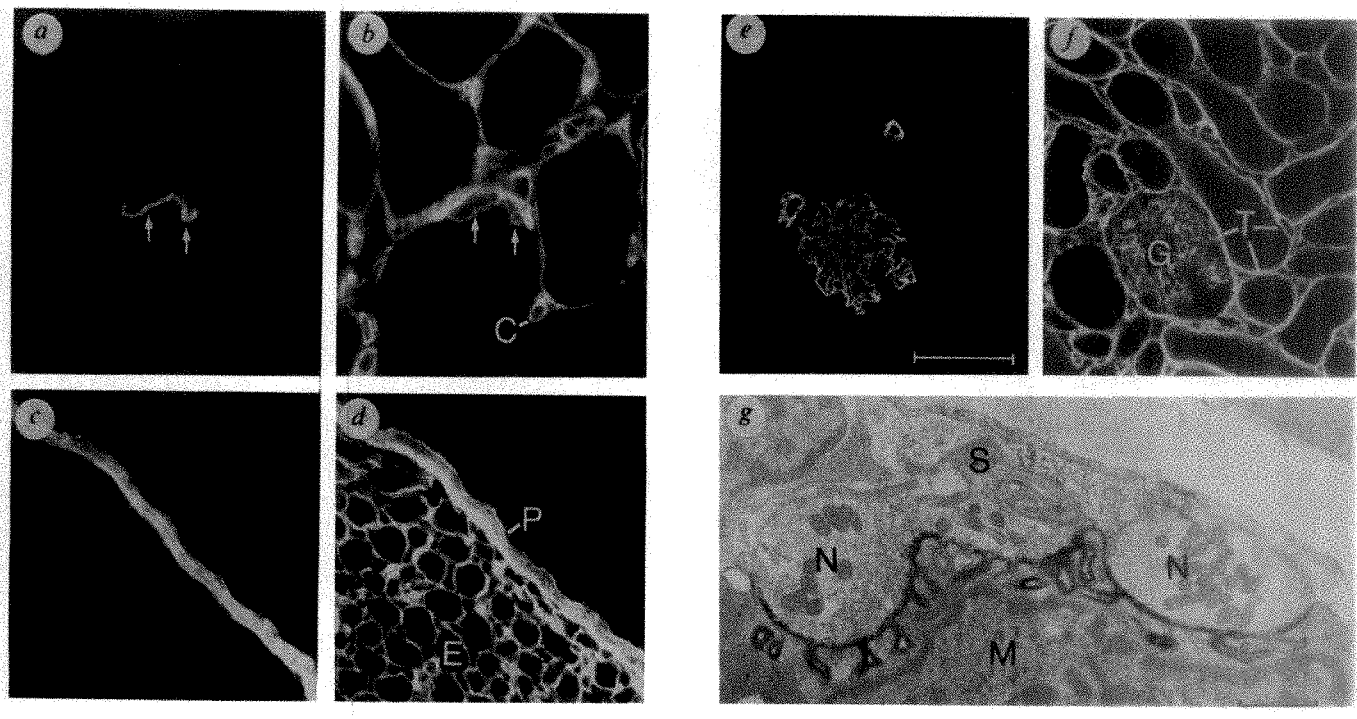

FIG. 1 S-laminin is restricted to a subset of laminin-rich BLs. Cryostat sections of rat skeletal muscle (*a, b*), sciatic nerve (*c, d*) or kidney (*e, f*) were doubly stained with anti-s-laminin mAb D7 plus fluorescein goat anti-mouse IgG (*a, c, e*) and with anti-laminin serum plus rhodamine goat anti-rabbit IgG (*b, d, f*), as described[44]. S-laminin is concentrated in synaptic (arrows) but not extrasynaptic or capillary (C) BL in muscle (*a, b*), in perineurial (P) but not endoneurial (E) BL in nerve (*c, d*) and in glomerular (G) but not tubular (T) BL in kidney (*e, f*). *g*, Electron micrograph of a neuromuscular junction from a muscle that had been stained with mAb C1 plus horseradish peroxidase second antibody[44]. Reaction product is concentrated in synaptic BL between nerve terminals (N) and muscle fibre (M); extrasynaptic and Schwann cell (S) BLs are not detectably stained. In experiments not shown here, we used methods described in ref. 5 to show that mAbs to s-laminin stained the BL in the synaptic cleft, rather than the pre- or postsynaptic membranes. Scale bar in *e*, 50 μm for *a–d* and 100 μm for *e, f*. Scale bar in *g*, 1 μm.

Restricted distribution of s-laminin

S-laminin was initially defined by an antiserum (JS-1) to an extract of lens capsule BL, which stained synaptic BL[5]. Because the antiserum was not monospecific, we generated four monoclonal antibodies (mAbs; C1, C4, D5 and D7; see refs 6, 10) that recognized JS-1-related antigens: each stained synaptic BL (Fig. 1*a*, *g*) and staining by each was blocked by preincubation of the sections with JS-1 (data not shown). All four mAbs recognized the same polypeptide, s-laminin (see below), but they differed in species cross-reactivity and in reactivity with denatured antigen, indicating that each mAb recognizes a distinct epitope. The selective staining of synaptic BL by these mAbs is therefore likely to reflect restricted distribution of s-laminin rather than differential accessibility of a uniformly distributed determinant.

Although s-laminin is concentrated at synaptic sites in muscle, it is abundant in some non-muscle BLs. In peripheral nerve, all four mAbs to s-laminin stained perineurial BL more intensely than endoneurial BL (Fig. 1*c*). In kidney, these mAbs stained glomerular BL more intensely than tubular BL (Fig. 1*e*). Within muscle, arterial BL was stained more strongly for s-laminin than venous or capillary BL. All BLs were strongly and similarly stained by antibodies to laminin (Fig. 1*b*, *d*, *f*) and to a heparan sulphate proteoglycan[11]. Thus, s-laminin is restricted to a subset of BLs both in muscle and elsewhere. Interestingly, in the tissues examined so far, BLs rich in s-laminin are apposed on both sides by cellular membranes (for example, nerve and muscle at the synapse, endothelium and podocyte in the glomerulus), whereas BLs poor in s-laminin separate cells from interstitial connective tissue[12].

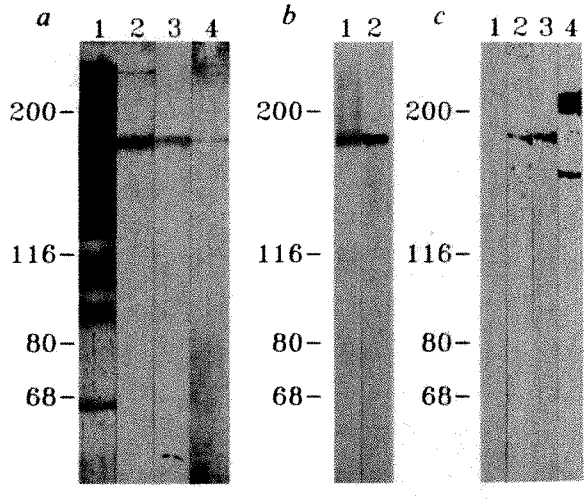

FIG. 2 Identification of s-laminin by immunoblotting. *a*, A crude extract of renal cortex was analysed by gel electrophoresis and either silver-stained (lane 1) or transferred to nitrocellulose and probed with mAbs C4 (lane 2), D5 (lane 3), or D7 (lane 4). Positions of relative molecular mass standards are indicated in thousands; the M_r of s-laminin is ~190K. *b*, Peak fraction from chromatofocusing column, silver-stained (lane 1) or immunoblotted with mAb C4 (lane 2); compare with lanes 1 and 2 in *a*. *c*, Renal extract, prepared as in *a*, and immunoblotted with normal serum (lane 1), a polyclonal antiserum to a fusion protein encoded by s-laminin cDNA RK65-6 (lane 2), mAb D5 (lane 3), or a polyclonal antiserum to laminin (lane 4).

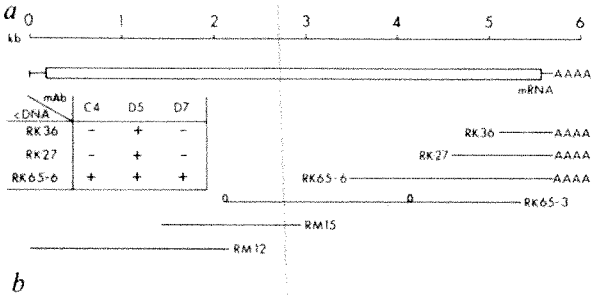
METHODS. Sample preparation and electrophoresis were performed as described[45], using 5% polyacrylamide gels. Electropheretic transfers to nitrocellulose (S&S BA85) were as described[46]; transfers were immunostained with 1:1,000 dilutions of anti-s-laminin antibodies or rabbit anti-laminin serum (Polysciences) and alkaline phosphatase-second antibody (1:1,500; Boehringer), according to the manufacturer's instructions. Transferred relative molecular mass markers were stained with 0.2% Ponceau S (Eastman Kodak) in 3% trichloroacetic acid (Aldrich) and 3% sulphosalicylic acid (Sigma). To purify s-laminin, homogenates of renal cortex were successively treated with 2M $MgCl_2$, 3% NP-40 and 6 M guanidine-HCl to remove soluble, membrane-bound and chaotrope-soluble components. S-laminin was then extracted from the residue with 6 M guanidine-HCl plus 10 mM dithiothreitol, resulting in a purification of ~100-fold. After dialysis, chromatofocusing chromatography was performed on PBE 94 (Pharmacia), following the manufacturer's instructions. Briefly, BL extract was dissolved in 7 M urea (ICN-Schwarz Mann) plus 5% β-mercaptoethanol, 2% NP-40, 25 mM imidazole pH 7.4, applied to a 1 cm by 10 cm column equilibrated with the same solution, and eluted with 7 M urea, 5% β-mercaptoethanol, 2% NP-40, 12½% polybuffer 74 (Pharmacia) pH 4.0. Fractions were assayed for s-laminin by immunoblotting and for protein content by dye binding (Bio Rad). S-laminin was eluted at a pH of ~6.5. To prepare antisera, RK65-6 was recloned into the pET vector[40], *Escherichia coli* were transformed and the protein was purified from a cell lysate by gel electrophoresis; gel slices containing 0.5 mg of fusion protein were homogenized in RIBI adjuvant and injected into rabbits.

Identification of s-laminin

Because glomerular BL has been characterized in detail[13], we used kidney to identify the antigen(s) recognized by mAbs C1, C4, D5 and D7. BL-rich fractions were analysed by immunoblotting. When samples were not reduced, the antibodies recognized only material with a relative molecular mass (M_r) of more than 10^6 (1,000K). Under reducing conditions, however, C4, D5 and D7 all stained a band of apparent M_r ~190K (Fig. 2*a*). C1 did not stain immunoblots, but C1-agarose precipitated C4-reactive material of about 190K. Immunoblots of two-dimensional gels (data not shown) and chromatofocusing chromatography (Fig. 2*b*) demonstrated that these mAbs recognized the same protein; it has an isoelectric point of ~6.5. Thus, a ~190K protein is identified as a subunit of s-laminin. In addition, C4 and D7 weakly stained a band of M_r ~400K; we have not studied the relationship of the ~400K material to the ~190K s-laminin.

The insolubility of s-laminin confirmed its association with the extracellular matrix. Little immunoreactive material was released upon incubation of s-laminin-rich fractions with high salt solutions, non-ionic detergents, reducing agents or strongly chaotropic agents. Extraction with a chaotrope (guanidine-HCl) plus a reducing agent (dithiothreitol) did, however, release most of the s-laminin detectable by immunoblotting. Collagenase treatment did not affect the M_r of extracted s-laminin. Solubil-

Loops represent introns found in RK65-3. Insert indicates immunoreactivities of fusion proteins generated from cDNAs with mAbs described in the text. *b*, Nucleotide and deduced amino-acid sequence of s-laminin. Predicted domains (see text), and their respective residues, are VI (1–248), V (249–520), IV (521–749), III (750–1,158), II (1,159–1,377), α (1,378–1,410) and I (1,411–1,766). Residues identical to those in mouse laminin B1[18] are underlined. The seven potential *N*-glycosylation sites (laminin B1 contains 14; see ref. 18) are in bold face. A predicted signal peptide of 35 amino acids (residues −35 to −1) is similar to that of laminin B2. If the signal peptidase cleavage site is located after the sequence Thr-Leu-Ala, in agreement with the '−3, −1' rule[47], s-laminin begins with glutamine, as do human and mouse laminin B1, human laminin B2 and mouse laminin A (refs 18, 19, 21, 23). A polyadenylation site (underlined) precedes the poly(A) tail by 12 bp.



METHODS. RK27 and RK36 were isolated from a kidney expression library (Clontech) using anti-s-laminin antibodies at 1:1,500 dilutions and 1:2,000 dilutions of an alkaline phosphatase-goat anti-mouse IgG, using published procedures[48]. RK65-3 and RK65-6 were isolated from the same library by hybridization at 42 °C with a ^{32}P-labelled fragment of RK27, as previously described[36]; washes were at 65 °C in 0.1 × SSC containing 0.1% SDS. RM12 and RM15 were isolated from a λgt11 library constructed from rat muscle poly(A)$^+$ RNA as previously described[49], using a ^{32}P-labelled fragment of RK65-3 (with washes as above) and a ^{32}P-labelled octadecanucleotide near the 5′ end of RK65-3 (with washes at 58 °C in 6 × SSC containing 0.1% SDS). The nucleotide sequence was determined after subcloning into Bluescribe (Stratagene), with a modification of the dideoxy chain termination method[50], using Sequenase (USB), oligonucleotide sequencing primers (synthesized at the Protein Chemistry Laboratory of Washington University) and α-[^{35}S]-dATP (NEN) as the label. All clones shown were sequenced on both strands.

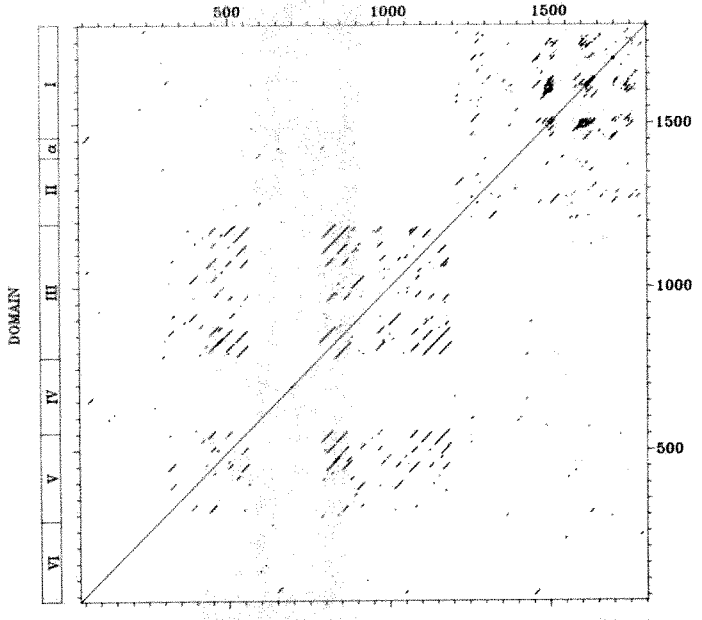
ized s-laminin bound to concanavalin A-agarose and wheat-germ agglutinin-agarose and could then be eluted by appropriate hapten sugars. These data indicate that s-laminin is a non-collagenous glycoprotein tightly attached to BL by a combination of hydrophobic and disulphide bonds.

Neuronal adhesion to s-laminin

As a first step in testing the hypothesis that regenerating axons interact with s-laminin at synaptic sites, we tried to determine whether neurons adhere to this protein. Neurons were incubated in s-laminin-coated tissue culture dishes for 2 h at 37 °C; unbound neurons were then rinsed away and adherent neurons counted. Chick ciliary neurons were chosen for these assays because they innervate striated muscle *in vivo*[14] and recognize synaptic sites on adult muscle fibres *in vitro*[15].

Neurons adhered comparably well to laminin and to a preparation of s-laminin that had been purified ~2,000-fold from renal cortex by selective extraction and chromatofocusing (Table 1, series A). Several other proteins were not adhesive in this assay. The s-laminin preparation contained no detectable laminin or

fibronectin (as judged by immunoblotting and silver-staining of SDS gels), but was not homogeneous. These results indicate that neurons adhere to s-laminin, but do not exclude the possibility that contaminants in the s-laminin preparation are involved. Neurons also adhered to s-laminin prepared by hydroxylapatite or mAb D5-agarose chromatography (Table 1, series A) however. Thus, neurons do adhere to s-laminin or to molecules that co-purify with s-laminin by three different methods.



Cloning of s-laminin cDNA

We used molecular cloning to obtain structural information about s-laminin and a source of recombinant protein for further assays of function. A rat kidney cDNA library in the expression vector λgt11 was screened with seven mAbs to s-laminin (the four described above and three others). From 7×10^6 plaques, we identified two clones that reacted with mAb D5 (RK27 and RK36; Fig. 3*a*). Using a fragment of RK27 as a probe, clones RK65-3 and RK65-6 were isolated by screening an additional 1.5×10^6 plaques. A 5′ fragment of RK65-3 was then used to screen 1.5×10^6 plaques from a rat muscle cDNA library; 19 clones, including RM12 and RM15, were isolated.

Sequence analysis indicates that these cDNAs span a distance of 5.6 kilobases (kb), comprising 68 base pairs (bp) of 5′ untranslated region, a single open reading frame of 5,403 bp, a 3′ untranslated region of 110 bp and a poly(A) tail (Fig. 3*b*). Monoclonal antibodies C4, D5 and D7 all bound specifically to a fusion protein encoded by RK65-6 (see Fig. 3*a*), indicating that the cDNA-encoded protein shares three distinct epitopes with s-laminin. Furthermore, antisera to RK27 and RK65-6 fusion proteins stained synaptic sites in sections (data not shown) and recognized s-laminin on immunoblots (Fig. 2*c*). Sequences of cDNAs derived from muscle and kidney are identical in regions of overlap. On northern blots, RK65-6 hybridized to a single mRNA of ~5.7 kb in RNA from kidney and muscle (data not shown). Together, these results demonstrate that we have cloned virtually the entire s-laminin mRNA.

S-laminin mRNA encodes a protein with a predicted M_r of 196,472 that is rich in cysteine, has seven potential *N*-glycosylation sites and includes an *N*-terminal signal sequence of $M_r \approx$ 3,471 characteristic of membrane-spanning and secreted proteins (Fig. 3*b*). These features are consistent with the properties of s-laminin described above. The most striking feature of the s-laminin sequence, however, is its homology to the laminin subunits. Laminin is composed of three subunits, A, B1 and B2, arranged in a cruciform structure[16]. On the basis of their predicted secondary structures, the laminin subunits have been divided into several domains. Domains I and II contain heptad repeats thought to form coiled-coil α-helices; III and V contain ~50-residue-long cysteine-rich repeats postulated to form loops; and IV and VI are predicted to be predominantly globular[17–24]. In the B1 but not the A or B2 subunits, domains I and II are separated by a short cysteine-rich domain, called α[18]. S-laminin contains all seven domains, I–VI plus α; matrix analysis highlights the repeats and the borders between domains (Fig. 4*a*). S-laminin has more similarity with the B1 subunit of laminin than with A and B2; all of the subunits are related to each other (Fig. 4*b*).

Several regions of the laminin B1 molecule have been implicated in functional interactions. The sequence YIGSR (in the one-letter code) in domain III adheres to cells of several types[25]; s-laminin contains the sequence YTGLR in a corresponding position. A 20-mer from domain IV

FIG. 4 *a*, Dot matrix plot comparing predicted amino-acid sequence of s-laminin to itself, to demonstrate internal repeats. Dots indicate positions at which more than 16 amino acids in a stretch of 30 are identical. Numbering of residues is from Fig. 3. Borders between domains are indicated along the axes. Multiple repeats in domains I–III and V are evident. *b*, Homologies (percentage identity) between amino-acid sequences of s-laminin and the subunits of laminin. Values of ≥35% are boxed. Sequences and their divisions into domains are from refs 17–24. Homologies were computed using the UWGCG GAP program with gap penalty = 0.3. Gap weight = 1 for *Drosophila* α and 5 for all other comparisons. For laminin A, domain G was omitted and scores for domains III a and b were averaged, as were scores for IV a and b. Values in parentheses under "total" are percentage similarity, in which evolutionarily conservative substitutions are given some weight. Note that s-laminin and laminin B1 are equally homologous to the *Drosophila* sequence that has been termed B1.

TABLE 1 Adhesion of ciliary neurons to s-laminin

Substrate		Neurons per field
Series A		
Laminin		21 ± 1
s-laminin	Chromatofocusing peak	15 ± 1
	Hydroxylapatite peak	24 ± 2
	D5-agarose eluate	20 ± 1
Bovine serum albumin		3 ± 1
Series B		
Laminin	+mAb C14	25 ± 2
	+mAbs C4 + D5	22 ± 2
		23 ± 3
Recombinant s-laminin (pET-RK65-6)		29 ± 3
	+mAb C14	25 ± 6
	+mAbs C4 + D5	3 ± 0

Laminin (Collaborative Research; 0.1 mg ml^{-1}), purified s-laminin 0.01 mg ml^{-1}), recombinant s-laminin (0.01 mg ml^{-1}), or bovine serum lbumin (BSA) (Sigma; 30 mg ml^{-1}) were applied to nitrocellulose-coated ssue culture dishes as described[43]; free sites on the nitrocellulose were ıen blocked with 30 mg ml^{-1} BSA for 2 h. Neurons dissociated from embry-nic-day-10 chick ciliary ganglia[15] were suspended in medium (DMEM with . mg ml^{-1} BSA and 10 mM HEPES, pH 7.3) and added to the dishes. After 2 h of incubation at 37 °C, plates were rinsed twice with medium, adherent ells were fixed with 2% formaldehyde and 2% glutaraldehyde and neurons vere counted. Wells containing antibodies (20 μg ml^{-1}) were incubated for .5 h before the addition of neurons. Each microscope field covered an area of 3 mm^2. Mean ± s.e.m. from 3–12 experiments are shown. Chromatofocus-ng is described in the Fig. 2 legend and illustrated in Fig. 2*b*. For chromatogra-phy on hydroxylapatite, immunoreactive material was eluted from a Bio-Gel HPHT (Bio-Rad) column with a gradient of sodium phosphate (10–350 mM, n 4M urea, 0.1% β-mercaptoethanol and 10 mM $CaCl_2$, pH 6.9). For immuno-affinity purification, mAb D5 was coupled to Affigel HZ (Bio-Rad); s-laminin was eluted with 0.1 M glycine-HCl, pH 2.8. Non-s-laminin polypeptides promi-nent in the hydroxylapatite and D5-agarose eluates were different from those detectable by silver staining in the chromatofocusing peak. Preparation of s-laminin fusion proteins in the pET vector[40] will be described elsewhere (D.D.H., B. Porter, J.P.M. and J.R.S., in preparation). Neurons did not adhere at levels above background to a non-s-laminin fusion protein or to a pET vector control. C14 is a mouse monoclonal antibody that recognizes a non-s-laminin BL antigen[6].

(RYVVLPRPVCFEKGMNYTVR) inhibits adhesion of some cells and binding of heparin to laminin[26]; s-laminin is identical in 11 of 20 positions (RVLVFPRPVCLEPGLSYKLK). A hexapeptide from domain V (LGTIPG) inhibits binding of a cellular receptor to laminin (R. Mecham, personal communication); the sequence of s-laminin is RGTVPG in the corresponding position. Finally, a neurite outgrowth-promoting site on laminin has been localized to a region near the C terminus of B1 and/or B2[27,28]; this domain is one of the least conserved between s-laminin and the laminin subunits (Fig. 4*b*). We do not yet know whether these differences conserve or abolish adhesive function.

Database searches (Genbank and NBRF) did not reveal any striking similarities of s-laminin with proteins other than laminin, although short regions of homology between several proteins and the repeats in domains I–III and V were detected, as noted previously for laminin[19–22]. More detailed comparisons failed to reveal extensive homologies between s-laminin and other neuroactive proteins that are associated with BLs under some circumstances—fibronectin[29], entactin[30], collagen IV[31], NCAM[32], L1[33] and tenascin[34]. S-laminin is also distinct from other proteins concentrated at the neuromuscular junction—acetylcholine receptor subunits[35], the 43K RAPsyn protein[36], acetylcholinesterase[37] (or its collagenous subunit[38]), or agrin[39] (the agrin N-terminal sequence was communicated by M. Smith and U. J. McMahan). The possibility that s-laminin is the rat equivalent of laminin B1 can be dismissed because of the limited amino-acid sequence identity (Fig. 4*b*) and because a laminin B1 cDNA (obtained from B. Hogan; see ref. 18) and a s-laminin cDNA encoding equivalent domains (I and II) recognize distinct restriction fragments on Southern blots of genomic DNA (data not shown). Thus, s-laminin is apparently a hitherto undescribed component of BL.

Neuronal adhesion to recombinant s-laminin

The cDNA clone RK65-6 encodes the C-terminal 40% of s-laminin. This sequence was subcloned into the pET expression vector[40] to produce a protein consisting of an 80K s-laminin fragment fused to a 10 amino-acid phage peptide. When tested in the cell-binding assay described above, this fusion protein mediated adhesion of ciliary neurons to substrata; adhesion was blocked by mAbs C4 and D5 (Table 1, series B). Thus, s-laminin contains at least one site that neurons recognize.

Conclusions

Starting with an antiserum that stained synaptic sites in muscle[5], we have identified a laminin-like component of synaptic BL with which motoneurons can interact. We undertook this work hoping to find factors that regenerating motor axons recognize at original synaptic sites, and our results support the candidacy of s-laminin for this role. The availability of s-laminin cDNAs will now allow critical tests of this hypothesis: effects of recombinant s-laminin on neuronal behaviour can be assessed and antisera to recombinant s-laminin can be tested for their ability to perturb axonal recognition of synaptic BL *in vitro*[15] and *in vivo*. In addition, recombinant s-laminin, and antisera to it, will be useful reagents for probing the function of s-laminin in non-muscle BLs.

The homology of s-laminin to laminin is interesting in two respects. First, it provides evidence for the existence of a laminin gene family that extends beyond the genes for the three laminin subunits. Some other extracellular matrix molecules (for example, the collagens), and some of their cellular receptors (for example, the integrins) are encoded by families of related genes[41,42], and the specificity of cell–matrix interactions may result in part from the differential expression of individual members of such families. In this context, it will be important to determine whether s-laminin-like homologues of laminin A and/or B2 subunits exist, whether other laminin-like genes exist, whether s-laminin can substitute for laminin subunits to form chimaeric complexes and whether any effects previously attributed to laminin are actually mediated by s-laminin. Second, it has recently become clear that laminin is a major axon outgrowth-promoting component of extracellular matrices in the peripheral nervous system and that neurons have several laminin receptors[9]. The results presented here raise the possibility that laminin itself is but one of a group of related molecules that could act together to regulate axonal behaviour in complex ways. In muscle in particular, laminin-rich pathways might provide a favourable terrain for regenerating axons to follow, whereas s-laminin at original synaptic sites might direct axons to stop growing and/or to differentiate into nerve terminals. □

WE have detected an optical pulsar with frequency f = 1,968.629 Hz at the location of supernova 1987A in the Large Magellanic Cloud. The brightness of the pulsed light increased from magnitude 19 to 18 during a 7-h observation period starting on 18.1 January 1989 UT, in observations taken using the 4-m telescope at Cerro Tololo Inter-American Observatory. The frequency of the pulsar during this same period varied in a nearly sinusoidal manner, with an amplitude of 1.5×10^{-3} Hz and a period of 8 h. If this is interpreted as the result of a binary orbit, it suggests that there may be a Jupiter-sized object orbiting the pulsar at a distance of 10^6 km. No significant pulsations were seen in data taken with the same detection system at the 100″ telescope at Las Campanas Observatory on 31 January UT, indicating that the pulsar had dropped below our detection limit of magnitude 20. Significant second ($2f$) and third ($3f$) harmonics were also observed.

The detection of the optical pulsar[1] in the supernova 1987A represents the culmination of a search program begun in March 1987, consisting of 37 separate observations from three different observatories[2]. A detector was used that was designed to allow for a pulsar search in the background of the bright light of the supernova. In the detector system, the current from a silicon photodiode was integrated over an interval of 2×10^{-4} s, digitized and written to tape. Manufacturer specifications for the photodiode, Hamamatsu model S1188-06, report the quantum efficiency of the silicon photodiode peaking at 70% at 0.6 μm, and greater than 50% between 0.4 μm and 0.9 μm; it averages about 60% over this range. No filter was used for the observations. The aperture size was 13 arcsec.

The analysis of the data follows that of Middleditch and Cordova[3]. We use a modified Fourier analysis[4], which differs from the standard Fourier transform by allowing the period of the expected signal to change with time, because the frequency of a pulsar may change significantly during an observation. We then searched the resulting power spectrum for nonstatistical peaks in the frequency range from 0.003 Hz to the Nyquist limit of 2,500 Hz (half the sampling frequency).

The data for 18 January were split into 15 independent contiguous sets. Except for three incomplete data sets, each contains 8 million (2^{23}) 200-μs samples and covers just under $\frac{1}{2}$ hour (1,677 s). Each set was analysed independently to find the frequency and frequency derivative that maximize the peak in the power spectrum. The results are listed in Table 1, which also includes the power found in the aliased second ($2f$) and third ($3f$) harmonics. The times given are the midpoints of each data set. The peak frequencies are shown as a function of time in Fig. 1*a*; shown in Fig. 1*b* are the same data after correction

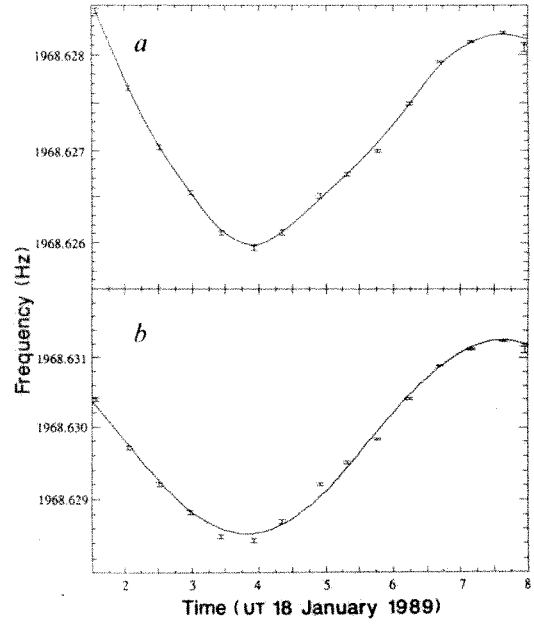

FIG. 1 *a*, Observed frequency versus time, for the 7-h run on 18 January 1989. The solid line is a guide to the eye. *b*, Same data, corrected for the Doppler shift resulting from the rotation of the Earth and its motion around the Sun (barycentric coordinates). The solid line is a sine function with best-fit values for amplitude, frequency, phase and offset.

* In Hz, barycentric coordinates. † Statistical uncertainty in the frequency determination, in units of 1×10^{-6} Hz. ‡ In 10^{-7} Hz s^{-1}. § Spectral power. The signal power is proportional to the square root of this. ‖ Number of standard deviations, indicating the statistical significance of the spectral power in the previous column. ¶ Spectral power for the second and third harmonics was calculated by compensating for the losses from aliasing and from the response of the front-end amplifier for the photodetector. # Values of power are low because data did not fill entire interval.

for the Doppler shift resulting from the rotation of the Earth and its motion around the Sun. The error bars shown are $\pm1\sigma$, determined by the run duration and the power in the peak. After the Doppler correction, the modulation exhibits a sinusoidal behaviour. A least-squares fit to a sine curve gave a solution with an amplitude of 1.36×10^{-3} Hz, a period of 7.6 h and a central frequency of $f_0 = 1{,}968.6299$ Hz; this fit is shown as the solid line in Fig. 1*b*. Also allowing a constant frequency derivative $(df/dt)_0$ in the fit gives an amplitude of 1.77×10^{-3} Hz, a period of 8.8 h, and $(df/dt)_0 = -5.3\times10^{-8}$ Hz s^{-1}. We conclude that the period of the modulation is 8 ± 1 h, the amplitude is $(1.5\pm0.3)\times10^{-3}$ Hz, $-(df/dt_0)<10^{-7}$ Hz s^{-1} and $(dP/dt)_0<3\times10^{-14}$ s s^{-1}. The residuals after the two fits were $(6\text{–}8)\times10^{-5}$ Hz (r.m.s.); these are statistically significant when compared with uncertainties in frequency (typically $(1\text{–}3)\times10^{-5}$ Hz).

Twelve minutes after the end of the 7-h observation of SN1987A, the telescope was pointed at the globular cluster NGC3201 (RA $10^h\,17^m$, δ −46°) for a half-hour of observation. No significant periodic signal was found in the globular-cluster data. We note that the pulsar signal was strongest just before these globular-cluster observations.

Each of the 8-million-point transforms showed a significant signal at the aliased frequency for the second harmonic, and five transforms (taken near the end of the observation, when the pulsar was brightest) showed a significant signal at the aliased frequency of the third harmonic. The frequency and intensity of the harmonics were modulated in the same manner as the fundamental, if one takes into account the frequency inversion expected for the aliased signals. The phase coherence of the pulsations was such that they could be tracked to an integral number of cycles across the individual data sets.

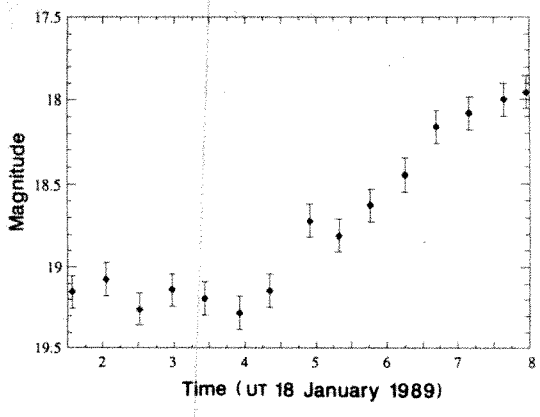

FIG. 2 Magnitude versus time for the 1,968-Hz fundamental frequency, for the same run as in Fig. 1. In addition to the uncertainties shown, there may be a systematic uncertainty of ±0.5 magnitude for each point.

We calculate the magnitude of the pulsar by comparison with a calibration run on the Crab pulsar (PSR0531 + 21) performed one year earlier, on 18 January 1988. We find a broad-band magnitude varying slowly over 7 h from mag 19 to 18 (Fig. 2), with a very significant rise in brightness from the beginning to the end of the run. The maximum magnitude observed was seven magnitudes dimmer than that of the supernova (which was magnitude 11 on 18 January); this is roughly the same as the magnitude difference between the Crab pulsar (magnitude 16.6) and the Crab nebula (magnitude 8.6). Despite a threefold increase in brightness, the ratio of the power emitted in the three harmonics is constant to within 40%. The ratio of amplitudes of the first three harmonics, for the run at 7.64 UT (the run with the best statistical significance) was 1 : 1.8 : 1.6. For comparison, in a short run on the Crab pulsar we observed the amplitudes of the first three harmonics to be in the ratio 1 : 1.8 : 1.1. Thus the signal shape is basically similar to the double-peaked light curve of the Crab.

It appears unlikely that we are observing two pulses per rotation of a pulsar whose rotation frequency is 984 Hz. No subharmonic was present at a level greater than 3% of the amplitude of the fundamental. If there were two pulses per rotation, they would have to be separated by exactly half of the rotation period and their shapes would have to be the same.

In the 36 runs made previous to the observation of the pulsar[2], the typical 90% confidence upper limit on the fraction of optical light that is pulsed is 2×10^{-4} of the total light from the supernova. The 90% figure is based on the lack of any peaks in the power spectrum more than 27.3 times the average local spectral power level S_{loc} at nearby frequencies; typically, the highest peaks actually observed were 20 times S_{loc}. (The probability that a random fluctuation will yield a peak with spectral power S_1 is $\exp(-S_1/S_{loc})$.) The range of these limits is set by the observation conditions and the noise at particular frequencies. Before January 1989, our faintest limit was $m = 20.6$, made on 27 August 1988, also at CTIO. On the evening of the detection, the observed spectral power for the fundamental in the 8-million-point transforms was $S_1 = 66\times S_{loc}$ at its weakest, and as much as $S_1 = 699\times S_{loc}$ at its strongest. The statistical significance of the peaks corresponding to these spectral power levels is shown in Table 1, and varies from 11 to 37 standard deviations. Thus each of the 15 runs taken on 18 January showed a signal of much greater significance than had been seen on any of the previous 36 runs over the preceding two years.

Given that the magnitude changed from 19 to 18 over the 7-h period on 18 January, it is not too surprising (although disappointing) that the brightness dropped below our detection threshold of 20th magnitude on 31 January. It is possible that the observed brightness variation was due to obscuring material in the expanding supernova shell.

In view of the lack of confirmation so far of the pulsations reported here, it seems useful to summarize the evidence for their proposed origin. They are extremely strong, and are clearly real; the question is whether they originate in the supernova or are merely instrumental. They are unlike anything seen in 36 previous runs using the same instrumentation over the preceding two years; a number of artefacts in the data have been seen over this period, but these pulsations are unprecedented in their strength and their behaviour. Taking into account the 8-h sinusoidal variation, they are phase-coherent over the entire 7 h of observation, so that an integral number of cycles for the fundamental frequency can be counted unambiguously between sets of data. The pulsations are as narrow in $(f, \mathrm{d}f/\mathrm{d}t)$ space as would be a δ-function for such a discrete Fourier transform, which implies an extremely good time-keeping mechanism. In addition to the fundamental frequency, evidence is seen for two higher harmonics which track the fundamental in frequency and intensity. The pulsations are not seen in data taken on another object immediately following the supernova observation. The observed frequency modulation is a good fit to a sine wave only when transformed to barycentric coordinates. The ratio of harmonics is similar to that seen in the Crab pulsar.

With a 0.51-ms period, the pulsar is spinning three times faster than any other known pulsar. For a nominal neutron-star radius of 10 km, the velocity of the surface is 40% of the speed of light. The radius of the light cylinder is only 24 km, as opposed to 1,600 km for that of the Crab pulsar. Assuming a nominal mass of 1 $M_\odot$, a uniform density and a spherical shape, the rotational energy is 6×10^{52} erg, which is comparable to the entire energy output from the explosion of SN1987A (the shape would, however, be highly non-spherical, because the centrifugal force is comparable to the gravitational force). This rotational energy, together with our limit on the period derivative ($\mathrm{d}P/\mathrm{d}t < 3\times10^{-14}$ s s^{-1}) means that $\mathrm{d}E/\mathrm{d}t < 7\times10^{42}$ erg s^{-1}.

The small value of $\mathrm{d}P/\mathrm{d}t$ suggests that this pulsar is still very close to its initial frequency. Friedman and coworkers[5,6] have shown that the very existence of a submillisecond pulsar rules out most of the equations of state that have been proposed for neutron stars. Only a very soft equation of state allows the high central compression of matter near the core of the star that is required to provide the gravitational binding necessary to overcome the centrifugal force.

Even a small deviation from axial symmetry in the mass distribution would yield considerable gravitational radiation. If we assume an asymmetric element of mass δm on the surface, yielding a quadrupole moment Q that changes with the rotation of the pulsar, then the energy released as gravitational radiation is approximately

$$-\frac{\mathrm{d}E}{\mathrm{d}t} \approx \frac{G\omega^6 \delta m^2 R^4}{45c^5} = 10^{54}(\delta m/M_\odot)^2 \text{ erg s}^{-1}$$

where ω and R are the angular frequency and radius of the pulsar, respectively. Our limit of $-\mathrm{d}E/\mathrm{d}t < 7\times10^{42}$ erg s^{-1} gives a limit of $\delta m < 3\times10^{-6}\,M_\odot$. Compared with the Crab pulsar, the gravitational radiation expected on the Earth from comparable mass irregularities is greater by a factor of $(\omega/\omega_{\mathrm{Crab}})^6/(D/D_{\mathrm{Crab}})^2$, that is, 10^8 times larger. Thus the pulsar may be a candidate for the detection of gravitational radiation, although for maximum sensitivity the detection must take into account the modulated frequency behaviour, perhaps by using an ephemeris derived from the optical signal.

If we assume that the energy loss rate from the pulsar is less than that radiated by the supernova ($\sim10^{38}$ erg s^{-1}), then we conclude that the pulsar must have a relatively weak magnetic field B. This can be seen easily by comparison with the Crab pulsar, which coincidentally also loses power at the rate of 10^{38} erg s^{-1}. If we use the scaling law for dipole emission with radiated power proportional to $B^2\omega^4$, the magnetic field would be lower than that of the Crab pulsar by the square of the frequency ratio, $(1{,}968/30.2)^2 = 4\times10^3$. Taking $B_{\mathrm{Crab}} = 4\times10^{12}$ gauss, we find the field for the SN1987A pulsar to be $B = 10^9$ gauss.

The observed 8-h frequency modulation of the pulsar could be due to an intrinsic change in the rotation frequency of the pulsar, or to a Doppler shift. If the change is intrinsic, it could be due to a periodic change by 10^{-6} in the moment of inertia of the pulsar, or to oscillations between two components of the pulsar (such as a hard crust and a superfluid core). In the two-component model, the rotation angle between the two components oscillates with a period of 8 h and an amplitude of $(1.4\times10^{-3}$ Hz$)\times(8$ h$) = \pm40$ radians $= \pm6.4$ turns, that is, about 13 turns peak-to-peak. Because of the great amount of energy stored in the pulsar spin, the forces required to drive such oscillations are enormous. A successful model must account for the relatively long period of 8 h while maintaining sufficient linearity under 13 turns to reproduce the observed sine-like variation.

The modulation could also be explained as a Doppler shift resulting from motion of the pulsar in a binary system. The observed frequency modulation is similar to that seen in PSR1957+20, a 1.5-ms pulsar with a binary companion in a 9.16-h orbit[7]. The frequency modulation of 1.4×10^{-3} Hz for the SN1987A pulsar implies a velocity (in km s^{-1}) of $0.2/\sin i$, where i is the inclination angle. The nearly sinusoidal behaviour implies a nearly circular orbit; the orbital frequency is $\Omega_0 = 2.2\times10^{-4}$; the orbital radius of the pulsar is $r_0 = v/\Omega_0 = (10^3$ km$)/\sin i$. From Kepler's law, the distance between the pulsar and its companion is $(GM/\Omega_0^2)^{1/3} = 1.3\times10^6$ km. The mass of the companion is then $10^3/(1.3\times10^6 \sin i) = 8\times10^{-4}\,M/(\sin i)$, which is comparable to the mass of Jupiter for $M = M_\odot$. The mass function is thus about $2.5\times10^{-10}M_\odot$.

This orbit would have been well within the radius of the blue giant progenitor star; it could not have survived the supernova explosion in such an orbit, so it would have to have been placed into orbit with the pulsar after the explosion. Perhaps it was left over from the core collapse, or ejected from the spinning pulsar, and then circularized by nearby orbiting material. We note that the pulsar has almost the maximum possible rotational velocity, and that the angular momentum of the companion is similar to that of the pulsar. The deviations of the oscillations from sinusoidal are statistically significant, and may indicate departures from a circular orbit, perhaps as a result of additional debris orbiting the pulsar, or they may indicate intrinsic changes in the pulsar rotation rate. The evolution of the sinusoidal modulation will be of great interest as a possible probe of the region 10^6 km from the pulsar.

Note added in proof. The pulsar was not seen in later observations on 13 February (Siding Springs 2.3-m telescope), and 16, 20 and 21 February (Las Campanas 100″ telescope), all with limits fainter than 20th magnitude. □

A numerical experiment on the chaotic behaviour of the Solar System

J. Laskar

SCMC du Bureau des Longitudes, UA 707 du CNRS,
77 Avenue Denfert-Rochereau, F75014 Paris, France

LAPLACE and Lagrange made an essential contribution to the study of the stability of the Solar System by proving analytically that, to first order in the masses, inclinations and eccentricities of their orbits, the planets move quasiperiodically. Since then, many analytic quasiperiodic solutions have been sought to higher order[1–10]. I have recently constructed an extensive analytic system of averaged differential equations containing the secular evolution of the orbits of the eight main planets, accurate to second order in the planetary masses and to fifth order in eccentricity and inclination, and including corrections from general relativity and the Moon[8–10]. Here I describe the results of a numerical integration of this system, extending backwards over 200 million years. The solution is chaotic, with a maximum Lyapunov exponent that reaches the surprisingly large value of ~1/5 Myr^{-1}. The motion of the Solar System is thus shown to be chaotic, not quasiperiodic. In particular, predictability of the orbits of the inner planets, including the Earth, is lost within a few tens of millions of years. This does not mean that after such a short timespan we will see catastrophic events such as a crossing of the orbits of Venus and Earth; but the traditional tools of quantitative celestial mechanics (numerical integrations or analytical theories), which aim at unique solutions from given initial conditions, will fail to predict such events. The problem of the stability of the Solar System will have to be set up again, and the qualitative methods initiated by Poincaré definitely need to replace quantitative methods in this analysis.

After the fundamental work of Laplace and Lagrange, it was assumed that the motions of the planets were quasiperiodic, and efforts in celestial mechanics in the nineteenth century were devoted to the construction of quasiperiodic solutions for all the bodies of the Solar System using perturbation techniques. This approach was questioned when Poincaré proved that, if it is possible to expand formally the solutions of the planet motions in infinite series, then in general these series are not convergent[11,12].

The KAM theory[13] nevertheless proved that if the perturbation is not too large (that is, if the masses, eccentricities and inclinations of the planets are sufficiently small), then a large set of initial conditions leads to quasiperiodic solutions[13]. It was not proved that the Solar System fulfilled these requirements. In fact, the Solar System is much too complicated, with far too many parameters, to obtain mathematical results on its stability at present (the mathematical knowledge of dynamical systems does not extend very far beyond two degrees of freedom).

To decide whether the initial conditions of the Solar System lead to a quasiperiodic or a chaotic solution, we have two approaches available: perturbation techniques and numerical integration. Improvements in computer speeds have enabled several numerical integrations on the long-term evolution of the Solar System to be made[14–19]. All of these deal with the outer Solar System (Jupiter to Pluto) and span from 500,000 years (ref. 14) to almost 10^9 years (in the latest integration[19]). One major result is numerical evidence for the chaotic motion of Pluto[19] from computation of its maximum Lyapunov exponent, which was found to be about 1/20 Myr^{-1}. This result gives the limit of predictability for the motion of Pluto, but as Pluto does not significantly perturb the rest of the Solar System, it yields no information on the limit of predictability of the essential part of the Solar System.

The direct numerical integration of the Solar System is reliable, but cannot as yet take into account the inner planets (Mercury, Venus, the Earth and Mars), for which orbital motion is too rapid. Here I use perturbation theory to remove the short periods from the motion equations; the averaged equations of the Solar System are then numerically integrated by Adam's method using a very large (500 yr) step size. I have constructed an extensive analytical differential system that gives the secular evolution of the orbits of the eight main planets of the Solar System, accurate up to second order with respect to the planetary masses and to fifth order in eccentricity and inclination. Corrections for the secular effects of the Moon and relativity are included, and a final differential system of about 150,000 polynomial terms[9] is obtained. The accuracy of the solution obtained by numerical integration of this system was checked by comparison with the complete numerical ephemeris of the Solar System DE102 (ref. 20) over the range of DE102, or 44 centuries[10]. This system was then numerically integrated over 30 Myr and its solution treated with a modified Fourier analysis to derive a solution of a quasiperiodic form over 10 Myr (ref. 21). At the same time, I found that there were many resonances in the long periods of the inner Solar System which prevented a good convergence of the solutions, suggesting that the inner Solar System is unstable[22] (similar problems of convergence have been encountered to a lesser degree by Nobili *et al.*[23] in their 100-Myr integration of the outer planets). The secular system has now been improved slightly by a small correction obtained by adjustment of three of the diagonal terms of the linear part of the secular system in order to take partially into account the third-order contribution with respect to the masses. This small change essentially improved the solution for the outer planets.

I have integrated the full system over 200 Myr. Applying my Fourier techniques to the numerical output, it was not possible to obtain a quasiperiodic solution valid over the whole timespan: when applied to different intervals of the timespan, the Fourier analysis showed significant variations of the main secular

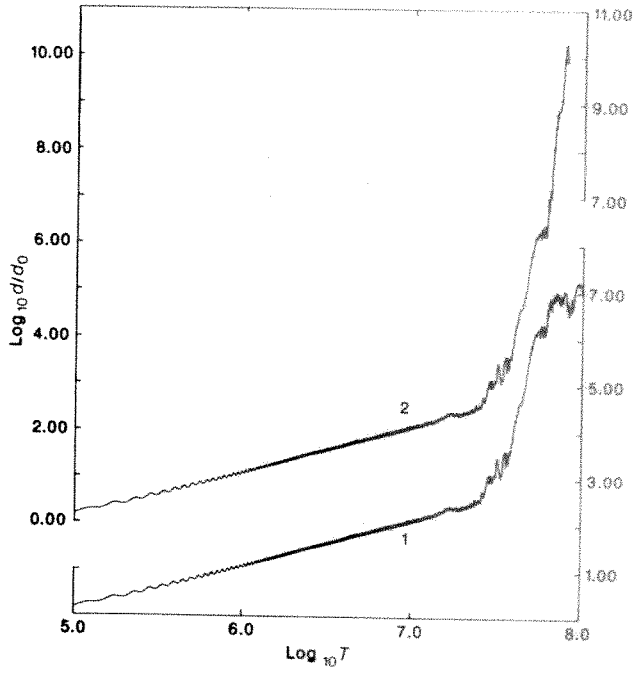

FIG. 1 Divergence of two nearby orbits. We plot $\log_{10}(d/d_0)$ versus $\log_{10}T$ (where T is time in years) over 100 Myr. At the beginning, the distance of two nearby orbits increases at a nearly linear rate. After about 30 Myr, an exponential divergence of the orbits dominates. The initial relative distance in the phase space is $d_0=10^{-7}$. In the absence of renormalization, the distance is bounded after ~60 Myr (curve 1). With a renormalization every 40 Myr, the second orbit stays close to the first and the cumulated distance is not bounded (curve 2).

frequencies of the inner planets, whereas for the outer planets, secular frequencies were steady (J. L., manuscript in preparation). All these facts suggest that the motion of the Solar System is chaotic.

The Lyapunov exponent measures the exponential rate of divergence of two nearby orbits. In quasiperiodic motion it should be zero. A non-zero Lyapunov exponent indicates chaotic motion[24,25]. The maximum Lyapunov exponent was estimated by computing the distance between two nearby orbits (with relative initial distance $d_0 = 10^{-7}$) in three different ways (Figs 1 and 2): either without renormalization (in this case the distance is bounded after ~60 Myr) or with renormalization every 40 Myr or every million years. In the three cases, I found the same Lyapunov exponent with the surprisingly high value of about $1/5\ \mathrm{Myr}^{-1}$.

This result gives a measure of the limit of predictability of my secular system: we have $d(T) \approx d(0)\, e^{T/5}$, where $d(T)$ is the distance of two close orbits in the phase space at time T in Myr. This shows that it is possible to give a precise solution of the Solar System over 10 Myr but not over 100 Myr (a perturbation as small as 10^{-10} of the initial conditions will lead to 100% discrepancy after 100 Myr). This result is particularly significant for the Milankovitch theory of palaeoclimate and the use of the orbital theory of the Earth as a timescale for changes in climate[26].

The chaotic behaviour of the Solar System comes mainly from the secular resonances among the inner planets (Mercury, Venus, the Earth and Mars). Predictions concerning the outer planets may last somewhat longer. I have not computed the maximum Lyapunov exponent of the Solar System with the inner planets excluded but, from the very regular behaviour of the solutions over 200 Myr compared with the inner-planet solutions, it is expected to be much smaller. This would explain why until now, except in the special case of Pluto, there have been no reports of non-zero Lyapunov exponents in the numerical integrations of the outer planets.

This surprisingly high Lyapunov exponent compared with the age of the Solar System needs cautious interpretation. The computation shows that the solutions of our differential system, with the initial conditions of the Solar System, are chaotic. This differential system is a close approximation to the real Solar System. We can conclude that the motion of the Solar System, and in particular the inner Solar System, is close to being chaotic, but the exact meaning of 'close' is still difficult to evaluate. Using perturbation methods, I have estimated the quality of the approximations used by comparison with the available numerical integrations[10,21]. This secular theory is more precise than any previously computed but in order to confirm these results, the computations should be repeated with a higher order of approximation. □

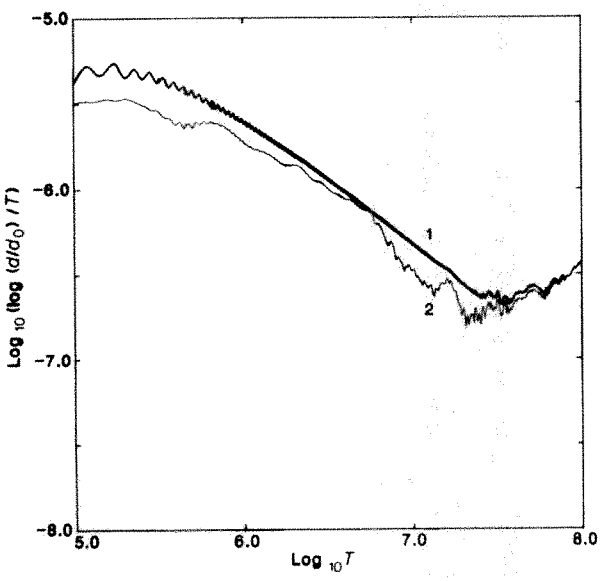

FIG. 2 Computation of the maximum Lyapounov exponent. We plot $\log_{10}(\log(d/d_0)/T)$ versus $\log_{10} T$ (where T is the time in years) over 100 Myr, with renormalization every 40 Myr (curve 1) or with renormalization every million years (curve 2) (the two curves do not coincide for the first million years because of different initial conditions). In the two cases, we obtain the same results for large values of T, which give a maximum Lyapunov exponent of about $10^{-6.7}\ \mathrm{yr}^{-1}$ ($1/5\ \mathrm{Myr}^{-1}$) for the secular system in eccentricity and inclination of the Solar System.

AN astronomical event recorded on a clay tablet found in 1948 among the ruins of the ancient city of Ugarit, in what is now Syria, was identified 20 years ago as a description of a total solar eclipse that occurred on 3 May 1375 BC[1,2]. The dating of ancient solar eclipses provides reference points to fix the long-term evolution of angular momentum in the Earth–Moon system[3]. We have reanalysed the Ugarit eclipse record[4]. A new historical dating of the tablet, and mention in the text of the visibility of the planet Mars during the eclipse as well as the month in which it occurred enables us to show that the recorded eclipse in fact occurred on 5 March 1223 BC. This new date implies that the secular deceleration of the Earth's rotation has changed very little during the past 3,000 years.

Tablet KTU 1.78 was discovered in 1948 among the remains of the Western Palace Archive in Ugarit[5]. The contents of this archive show that it was used over the entire span of the Late Bronze Age III period (around 1350–1175 BC)[6]. However, of all the different genres found in the various archives of Ugarit, only the legal texts and treaties were kept for future reference throughout this period. The other genres were represented only

by texts dating to the last half-century of Ugarit's existence[6]. Therefore, it is likely that KTU 1.78 dates from around the second half of the thirteenth century or the first quarter of the twelfth century BC.

The text recorded on tablet KTU 1.78 was studied in detail by Sawyer and Stephenson[2], who were the first to realize that the astronomical event described may refer to a total solar eclipse. The text has recently been studied again by van Soldt[4]. The new translation runs as follows:
(Obverse) "On the . . . day of the new moon in (the month) *ḫiyaru* the Sun went down, its gate-keeper was *Ršp*". (Reverse) "Two livers were examined: danger".

The meaning of the phrase "*bit*", left open in the translation above, is problematic. Sawyer and Stephenson rejected the most obvious translation of "*it*" as "six" because a solar eclipse can occur only close to the beginning of a lunar month. Van Soldt[4] offers "the sixth hour" as an admittedly speculative possibility. As already pointed out by Sawyer and Stephenson, *Ršp* is probably to be identified with the planet Mars.

The correct translation of the text on the reverse side of the tablet is due to Dietrich *et al.*[7]. Apparently the anxiety caused by the eclipse of the Sun and the sudden appearance of Mars had to be resolved by an explanation through liver divination.

To be able to fix more precisely the date at which the eclipse was observed we need to know the place of the month *ḫiyaru* in the Ugaritic calendar. The Ugaritic calendar was a lunar one consisting of twelve months, of which ten are known by name. Making use of a collation of a key text in the Damascus Museum by one of us (W.H.v.S., unpublished work), we were able to establish the order of the months[4]. According to de Moor[8], the year in Ugarit started with the first day of *riš yn*, "the new Moon nearest to the autumn equinox". The reconstructed calendar and its approximate relation to the months in the Julian calendar in 1200 BC are summarized in Table 1. The synchronization to the Julian calendar can only be approximate because by occasional intercalation the beginning of the year was kept close (within about four weeks) to the date of the autumn equinox. We conclude that the first day of *ḫiyaru* must have fallen in the second half of February or the first half of March.

Based on the considerations above we draw up a list of conditions which an attempted dating of the solar eclipse in KTU 1.78 has to satisfy. (1) The year in which the eclipse took place should preferably be found between 1250 and 1175 BC. (2) The planet Mars must have been visible during the eclipse. (3) The date (the "day of the new Moon" in the month *ḫiyaru*) has to be set in the second half of February or in the first half of March.

Sawyer and Stephenson[2] identified four solar eclipses that could have been total in Ugarit during the period 1450–1200 BC: on 14 July 1406 BC, 3 May 1375 BC, 8 January 1340 BC and 5 March 1223 BC (all dates are given according to the Julian calendar). They selected the one that occurred on 3 May 1375 BC as the eclipse referred to in the tablet, based on the fact that it takes place in April–May, the time of year that they associated with the month of *ḫiyaru*. This association is based on an erroneous identification of *ḫiyaru* with the Babylonian month *ajjaru*.

Using a recent tabulation[9] of all solar eclipses observable in the ancient Near East from 3000 BC to AD 0, we find that only those of 1406 BC, 1375 BC and 1223 BC could have come close to being total in Ugarit. Between 1250 BC and 1175 BC the eclipse of 5 March 1223 BC is the only possible candidate.

We must now ask whether Mars was in the sky at the time of this eclipse. By using the series expansions of planetary perturbations published by van Flandern and Pulkkinen[10], we are able to calculate by computer solar, lunar and planetary positions for arbitrary epochs. All time-dependent terms in the solar, lunar and planetary elements listed in the Explanatory Supplement of the Astronomical Ephemeris[11] (ESAE) are included in these calculations. The accuracy of the resulting positions is estimated at about one arcmin for dates more recent than 2,000 years ago. For dates after 600 BC the results can be compared with the less accurate tables of Tuckerman[12]. The calculated positions usually agree to within 0.1°.

Of the three candidate eclipses mentioned above, the one occurring on 5 March 1223 BC is the only one during which the planet Mars was above the horizon. More significantly, Mars was located at 337.0° ecliptic longitude and −0.8° ecliptic latitude, only 3.5° from the centre of the eclipsed Sun at ecliptic longitude 333.6°.

The observation that Mars was present during the eclipse is a strong indication that the eclipse must indeed have been total. Muller and Stephenson[13] discuss the visibility of stars and planets during a solar eclipse and conclude that the brightest stars and planets are usually visible during a total eclipse, which is consistent with many eyewitness accounts.

Using formulae given by Allen[14], we have calculated a visual magnitudes for all planets, and all stars brighter than Mars, above the horizon during the eclipse. The results are listed in Table 2. Visual magnitudes for the stars were taken from ref. 15. The data in Table 2 show that Mars was amongst the ten brightest objects in the sky. Its proximity to the eclipsed sun may have decreased its observability because of the coronal glow, but may also have enhanced the likelihood of its observation.

The "day of the new Moon" for the eclipse date does not make sense in a Babylonian-type lunar calendar, for which months began at sunset on the day of first crescent visibility. It fits exactly[4], however, if we assume an Egyptian-type lunar calendar, for which the month began at sunrise on the day of first crescent invisibility and the second day of the month was named "new crescent day"[16]. It is not unexpected to find the Egyptian calendar in Ugarit. We know that it was used in ancient Israel[17], and Egyptian influence in Ugarit during the second millenium BC is attested in several sources[18].

TABLE 1 The order of the months in the Ugaritic Calendar and their relation to the Julian Calendar in 1200 BC

1	*rlš yn*	Sep/Oct	7	*ḫlt*	Mar/Apr
2	*nql*	Oct/Nov	8	*gn*	Apr/May
3	*mgmr*	Nov/Dec	9	*ltb*	May/Jun
4	*pgrm*	Dec/Jan	10	?	Jun/Jul
5	*lb'lt*	Jan/Feb	11	?	Jul/Aug
6	*ḫyr*	Feb/Mar	12	*lttbnm*	Aug/Sep

TABLE 2 The brightest stars and planets above the horizon in Ugarit on 5 March 1223 BC at 13^h20^m Local Mean Time, listed in order of decreasing visual brightness

Star	Name	Az* (degrees)	El*	m_v (magnitude)
	Sun/Moon	337	41	
	Venus	22	61	−4.58
α CMa	Sirius	65	2	−1.46
α Lyr	Vega	231	15	0.03
α Aur	Capella	99	63	0.08
β Ori	Rigel	49	20	0.12
α CMi	Procyon	89	13	0.38
α Ori	Betelgeuse	67	29	0.50
	Mercurius	317	20	0.67
α Tau	Aldebaran	51	47	0.85
β Gem	Pollux	105	29	1.14
α Cyg	Deneb	246	35	1.25
	Mars	341	43	1.28

* Positions are given in azimuth and elevation rounded off to full degrees. Azimuth is measured anticlockwise along the horizon from the south (Az = 0°), elevation is measured perpendicular to the horizon (zenith corresponds to El = 90°).

If time was also kept in the Egyptian way (ten day-hours from sunrise to sunset[19]) the suggested translation of *btt* as "sixth hour" gains credibility because the eclipse took place at 13^h20^m, whereas sunrise and sunset occurred at 6^h45^m and 17^h45^m Local Mean Time, respectively.

Using the order of the months in Table 1 we find that the beginning of the Ugaritic year, the first day of the month *riš yn*, fell on 7 October 1224 BC, quite close to the actual equinox date of 1 October.

We have investigated the implications of the new eclipse date for the secular deceleration of the Earth's rotation rate. We tested our calculations by comparison with modern data of a number of twentieth-century eclipses[20].

To include the effect of the secular accelerations of the Earth and Moon for dates in the past, the ESAE recommends the following expressions for the secular increment in the mean longitude of the Moon, λ_m, and for the difference between Universal and Ephemeris Times:

$$\Delta\lambda_m = -11.22\ T^2 \text{ arcsec} \quad (1)$$

$$\Delta T = \text{ET} - \text{UT} = 24.3 + 72.3\ T + 30.0\ T^2 \quad \text{seconds} \quad (2)$$

where T is the time in Julian centuries since 1.0 January 1900. The magnitude of $\Delta\lambda_m$ corresponds to an acceleration rate of the Moon's mean longitude of $\dot{n} = -22.44$ arcsec century^{-2}. According to equations (1) and (2), in 1223 BC the effect of the secular accelerations produces large differences in lunar longitude and in time, 3.0° and 8.8 hours respectively.

The standard ESAE value of the lunar acceleration rate is confirmed by recent studies. The McDonald Observatory lunar laser-ranging experiment[21] gives a value of $\dot{n} = -23.8 \pm 1.5$ arcsec century^{-2}, equal, within errors, to the standard value. A re-analysis[22] of modern (1717–1973) lunar and planetary observations yields $\dot{n} = -22.2 \pm 0.8$ arcsec century^{-2}, which is fully consistent with the lunar laser-ranging result and the standard value.

To accommodate variations in the deceleration rate of the Earth relative to the standard ESAE value we add to ΔT in equation (2) a time parameter δt. If the adopted deceleration rate is too large or too small, δt will systematically decrease or increase going further into the past.

We have analysed the eclipse of 5 March 1223 BC in Ugarit (geographical coordinates 35°37′ N, 35°47′ E) by calculating its magnitude as a function of time for several values of the parameter δt. Requiring that the eclipse must have been total results in the condition $-3^m \leq \delta t \leq 6^m$. The accuracy of this result is estimated to be about 3 min. Thus the average deceleration of the Earth's rotation rate over the past 3,000 years is well described by the standard ESAE value of the deceleration parameter, and long-term variations (on the scale of centuries) in the deceleration rate over this period have probably been small. This result is of geophysical importance because it helps to establish the nature of the processes, other than the lunar tidal torque[23], affecting the rotation rate of the Earth. □

Superconductivity at 27 K in fluorine-doped Nd_2CuO_4

A. C. W. P. James, S. M. Zahurak & D. W. Murphy

AT&T Bell Laboratories, Murray Hill, New Jersey 07974, USA

THE recent report[1] of superconductivity in $Nd_{1.85}Ce_{0.15}CuO_4$ is the first example of a high-transition-temperature (high-T_c) superconductor with electrons as the charge carriers and a formal copper oxidation state of less than +2. All previously characterized copper oxide superconductors are hole-doped, and the copper is formally oxidized. Here we show that substitution of fluorine for oxygen in T′-phase Nd_2CuO_4 provides an alternative route to achieving formal reduction of copper, electron conductivity and superconductivity at temperatures as high as 27 K. This result is unusual, because anionic rather than cationic substitution gives rise to the superconductivity.

We explored several routes to the preparation of $Nd_2CuO_{4-x}F_x$; the best results were obtained by heating stoichiometric mixtures of CuO, Nd_2O_3 and freshly prepared NdF_3 in air at 900 °C for 14 h followed by pelletizing and heating at 890 °C for 14 h in flowing N_2. A single phase with the T′ structure was obtained for samples of nominal composition $Nd_2CuO_{4-x}F_x$ with $0 < x < 0.4$. Fluorine analysis was carried out by the Schwarzkopf Microanalytical Laboratory on a sample of nominal composition $x = 0.4$; the analysed composition was found to be $x = 0.28$. (Hereafter we will refer always to nominal compositions.) Loss of fluorine could occur in the initial firing step by hydrolysis of NdF_3 to NdOF (ref. 2). After the initial firing in air, X-ray powder-diffraction patterns of the $Nd_2CuO_{4-x}F_x$ samples showed the characteristic lines of the T′ structure, with small amounts of NdOF; the NdOF lines disappeared after firing in N_2. Lattice parameter refinements showed that fluorine substitution results in a small contraction (up to 0.2%) of the c axis and a small expansion (up to 0.3%) of the a and b axes; for example, the lattice parameters of the $Nd_2CuO_{3.6}F_{0.4}$ sample were found to be $a = 3.961 \pm 0.006$ Å,

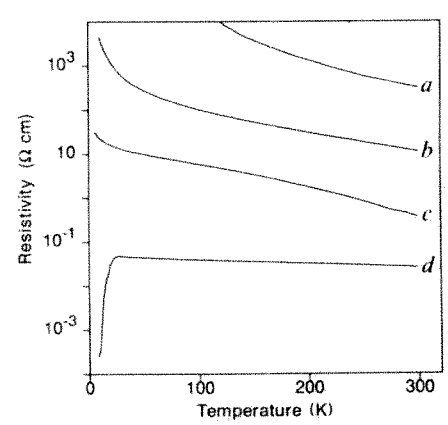

FIG. 1 Electrical resistivity of *a*, Nd_2CuO_4 prepared in air at 900 °C; *b*, Same sample after annealing in N_2 at 890 °C for 14 h; *c*, Sample of nominal composition $Nd_2CuO_{3.6}F_{0.4}$ prepared in air at 900 °C; *d*, Same fluorinated sample after annealing in N_2 at 890 °C for 14 h.

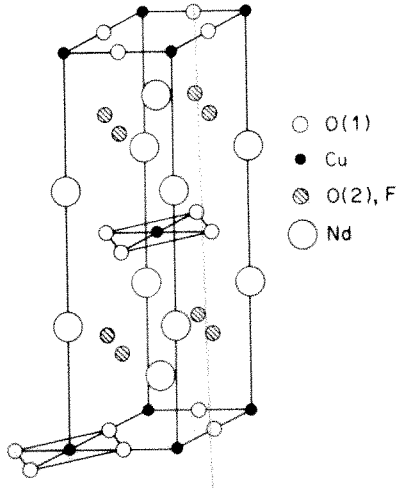

FIG. 2 The T'-Nd_2CuO_4 structure, showing the suggested location of the fluorine atoms in $Nd_2CuO_{4-x}F_x$.

$c = 12.13 \pm 0.02$ Å. The average Cu oxidation state in samples of $Nd_2CuO_{4-x}F_x$ was determined by iodometric titration[3]. The unsubstituted material Nd_2CuO_4 was found to have a Cu oxidation state of $+2.00 \pm 0.02$ both before and after firing at 890 °C in nitrogen. The $x = 0.4$ sample gave a Cu oxidation state of $+1.89 \pm 0.02$ after the initial firing in air and $+1.76 \pm 0.02$ after firing in N_2 overnight. Combining the fluorine and oxidation-state analyses gives an overall composition of $Nd_2CuO_{3.74}F_{0.28}$, which is very close to the stoichiometric limit of four anions per Cu. These results indicate that nitrogen annealing at 890 °C results in a greater degree of fluorine substitution in $Nd_2CuO_{4-x}F_x$ compared with air firing, without changing the total anion stoichiometry.

Substitution of F for O was also attempted in the other rare-earth copper oxides M_2CuO_4 (where M represents Pr, Sm, Eu or Gd), all of which have the T' structure. Single-phase materials of nominal composition $Pr_2CuO_{4-x}F_x$ $(0 < x < 0.4)$ could be prepared by a method similar to that described above. Pure Sm, Eu and Gd analogues, however, could not be prepared because of increasingly facile reductive decomposition under N_2 to mixtures of the corresponding rare-earth oxides, oxyfluorides and Cu_2O. A similar reductive decomposition under N_2 was observed for $Pr_2CuO_{4-x}F_x$ and $Nd_2CuO_{4-x}F_x$ at temperatures above 950 °C and 900 °C respectively. Recent studies have shown that the cerium-substituted superconductor $Nd_{1.85}Ce_{0.15}CuO_4$ also decomposes at elevated temperature under N_2.

Figure 1 shows resistivity as a function of temperature for $Nd_2CuO_{4-x}F_x$ (nominal composition $x = 0$, 0.4). The sample of $Nd_2CuO_{3.6}F_{0.4}$ fired in air shows a slope that is characteristic of a semiconductor, with conductivity substantially higher than that of Nd_2CuO_4, but no indication of superconductivity. After firing in N_2 the slope is reduced and there is a clear superconducting transition. The onset temperature for superconductivity was found to increase with nominal fluorine content to a maximum of 27 K for $x = 0.3$, and then to decrease, reaching 10 K in an $x = 0.5$ sample, which was no longer single-phase. No superconductivity was observed in a sample of nominal composition $x = 0.1$. The superconducting transitions were broad in all cases and depended on the details of the sample composition and preparation. The sharpest transition observed was in a sample of $Nd_2CuO_{3.6}F_{0.4}$; in this case the superconducting onset temperature was 21 K and zero resistance was observed at 12 K. Flux-exclusion measurements on two samples with $x = 0.2$ and 0.4 each showed 13% Meissner effects. All of the fluorinated samples exhibited n-type conductivity at room temperature, as determined by Seebeck-effect measurements. The fluorinated Pr copper oxides $Pr_2CuO_{4-x}F_x$ $(x > 0.2)$ also superconduct; the a.c. susceptibility exhibits a strong diamagnetic signal at 4.2 K and the resistivity shows a sharp drop at temperatures as high as 13 K (for the $x = 0.4$ sample). However, zero resistance at 4.2 K was not achieved in any of the Pr samples. Although samples containing rare earths other than Pr could not be made as a single phase for the reasons mentioned above, screening of multiphase materials by a.c. susceptibility has failed to show superconductivity.

Although F and O are similar in size, their mutual substitution is often limited, especially in transition-metal compounds. The extent of substitution of fluorine in $YBa_2Cu_3O_7$ is limited, and its effect on superconductivity is detrimental[4], because $YBa_2Cu_3O_7$ is a p-type conductor in the normal state so that fluorine doping reduces the carrier density. That substantial fluorine substitution is possible in $Nd_2CuO_{4-x}F_x$ may be explained on the basis of its T' structure[5] (Fig. 2). The structure contains two oxygen atom sites: O(1) is bonded to Cu, forming the Cu–O square net common to all copper oxide superconductors, whereas O(2) is bonded to Nd, forming a fluorite-type layer between the CuO_2 sheets. It is the O(2) atoms that we believe to be substituted by F. Substitution on this site would not disrupt the CuO_2 plane and would make the bonding of the $NdO_{2-x}F_x$ layer similar to that of NdOF, which has a distorted fluorite structure.

The phase purity and substantial flux exclusion below T_c of the T'-phase $Nd_2CuO_{4-x}F_x$ indicate bulk superconductivity, but the broad superconducting transitions and semiconducting slope of the electrical conductivity above T_c suggest that the samples are not completely homogeneous. Similar behaviour has been observed in ceramic samples of other solid-solution superconductors $La_{1.85}Sr_{0.15}CuO_4$ (ref. 6) and $Pb_2Sr_2Y_{1-x}Ca_xCu_3O_8$ (ref. 7). □

Optical study of the metal–insulator transition on $Ba_{1-x}K_xBiO_3$ thin films

H. Sato, S. Tajima, H. Takagi & S. Uchida

Engineering Research Institute and Department of Applied Physics, University of Tokyo, Bunkyo-ku, Tokyo 113, Japan

THE superconducting perovskite (Ba, K)BiO_3 (refs 1, 2) has the highest transition temperature known ($T_c \approx 31$ K) aside from the copper oxide compounds[3]. This system becomes superconducting upon the substitution of monovalent potassium for divalent barium in the parent insulator $BaBiO_3$, analogous to the substitution of strontium for lanthanum in La_2CuO_4. To understand whether the mechanism of the superconductivity is the same as in the copper oxide compounds, it is important to know the origin of the insulating state of the parent material, as well as the basic character of the metallic state induced by the cation substitution. In the case of its predecessor Ba(Bi,Pb)O_3, optical measurements were used to investigate the change in electronic state across the metal–insulator transition at 65% lead doping[4]. Here we report the successful synthesis of (Ba,K)BiO_3 thin films, which has allowed

us to measure the optical spectrum, as well as the transport coefficients of (Ba,K)BiO_3. Our results, combined with the previous report of the X-ray crystal structure[5], strongly suggest that the Peierls gap, responsible for the insulating state of $BaBiO_3$, almost completely vanishes at the metal–insulator transition, resulting in a metallic state described by band theory[6].

The $Ba_{1-x}K_xBiO_3$ thin films were epitaxially grown on $SrTiO_3$ (110) substrates using an r.f.-magnetron sputtering method with substrate temperature of 400 °C. The sputtering targets were prepared from a powder mixture of Bi_2O_3, BaO and KO_2 by means of the two-step synthesis procedure[7]. The composition of the targets was adjusted so as to reduce the deviation of the composition of the sputtered films from the stoichiometric ratios, because films sputtered from a stoichiometric target contained a large number of K and Bi vacancies. The chemical composition of the films was determined roughly by electron-probe microanalysis and X-ray fluorescence analysis. In particular, the K composition (x) was estimated from the lattice constant[8]. The K composition was sensitive to both the argon gas pressure and the oxygen partial pressure. The superconducting films with the highest potassium concentration, $x = 0.39$, were obtained by using a gas mixture of argon with 1% oxygen at a pressure of $\sim 10^{-2}$ torr. Under these conditions, the deposition rate was ~ 2 Å s^{-1} and the typical thickness of the films was ~3,000 Å. Because of the reducing growth conditions, the films had large numbers of oxygen vacancies; these were filled by annealing the films in flowing oxygen at ~500 °C for 1 h.

Figure 1 shows the X-ray diffraction pattern; the films are almost perfectly orientated in the (110) direction without any trace of a secondary phase. The width of the diffraction peak is comparable to that of the single-crystalline substrate, which demonstrates the good quality of the films.

Not all of the films were superconducting. After oxygen annealing, the films with $x > 0.35$ had a very sharp superconducting transition, whereas films with $x < 0.35$ remained semiconducting. The superconducting transition was observed with both resistivity and magnetization measurements. As seen from the inset of Fig. 2, the onset transition temperature is 23 K, the transition width being no more than 0.2 K. The sharp transition and the high critical-current density at 4.2 K of 7×10^4 A cm^{-2} (which is comparable with the value of 2.5×10^5 A cm^2 reported for a Ba(Bi,Pb)O_3 single-crystalline thin film[9]) testify to the homogeneity of the films.

From 300 to 150 K, the resistivity is almost constant and is <1 mΩ cm, indicating that grain boundaries have a smaller effect than in the polycrystalline specimens, for which significantly higher resistivity has been reported[10,11]. Below 150 K the resistivity has a positive (that is, metallic) temperature coefficient which has never been observed for polycrystalline samples.

The metallic nature is also confirmed by the optical reflectivity spectrum. Figure 2 shows a reflectivity edge due to free-carrier plasma for $Ba_{0.63}K_{0.37}BiO_3$ thin films. This reflectivity spectrum fits the Drude free-electron model well in the energy range from 0.5 to 2.0 eV. The fit is not so good in the energy region above 2 eV because of the presence of an absorption band at ~3 eV. The fitting parameters are $\hbar\omega_p = 1.59$ eV, $\hbar\gamma = 0.92$ eV and $\varepsilon_\infty = 3$, where ω_p, γ and ε_∞ are the plasma frequency, the damping factor and the optical dielectric constant, respectively. The 'bare' plasma energy $\varepsilon_\infty^{1/2}\hbar\omega_p$ (formally equal to $(4\pi ne^2/m^*)^{1/2}$, m^* and n being the effective mass and the density of carriers, respectively) is 2.8 eV, which is ~50% smaller than the value of 4.1 eV given by band calculations[12]. However, in view of the uncertainty in the value of ε_∞ due to the absence of higher-energy reflectivity data, the agreement between experimental results and band theory calculations is satisfactory. The estimated conductivity at zero energy, $\sigma_{d.c.} = \varepsilon_\infty\omega_p^2/\gamma$, obtained from these parameters is $\sim 2 \times 10^3\ \Omega^{-1}\ cm^{-1}$ and is nearly consistent with the resistivity measurement.

The spectrum is significantly different from that of superconducting $BaBi_{0.25}Pb_{0.75}O_3$, for which $T_c = 12$ K. In the latter case, the plasma spectrum does not fit the Drude model even in the energy region below 1 eV owing to the specific circumstances described below[4].

Taking advantage of the synthesis of these thin films, we investigated the metal–insulator transition using transmittance measurements. Figure 3*a* shows the optical-conductivity spectra obtained from both reflectivity and transmission measurements on $BaBiO_3$ films and those with K substituted at $x = 0.17$, 0.28 and 0.37. For comparison, Fig. 3*b* shows the optical-conductivity spectra of $BaBi_{1-x}Pb_xO_3$, which were obtained from the reflectivity spectra by means of a Kramers–Kronig transformation[4].

A rather sharp dominant absorption peak is observed at 2 eV in the spectrum of $BaBiO_3$, the parent compound of both systems, which we therefore interpreted to be a Peierls insulator with an optical energy gap of ~2 eV (ref. 4), similar to the simple cubic metals originally considered by Peierls[13]. In $BaBiO_3$, the

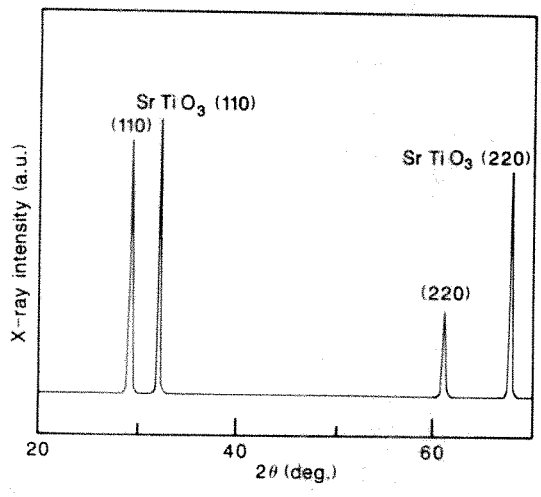

FIG. 1 Cu $K\alpha_1$ X-ray diffraction pattern of a 3,000-Å-thick film of $Ba_{1-x}K_xBiO_3$ on a $SrTiO_3$ (110) substrate. The calculated lattice parameter was 4.275 Å, which corresponds to a K concentration $x = 0.39$, according to ref. 8. X-ray intensity is expressed in arbitrary units.

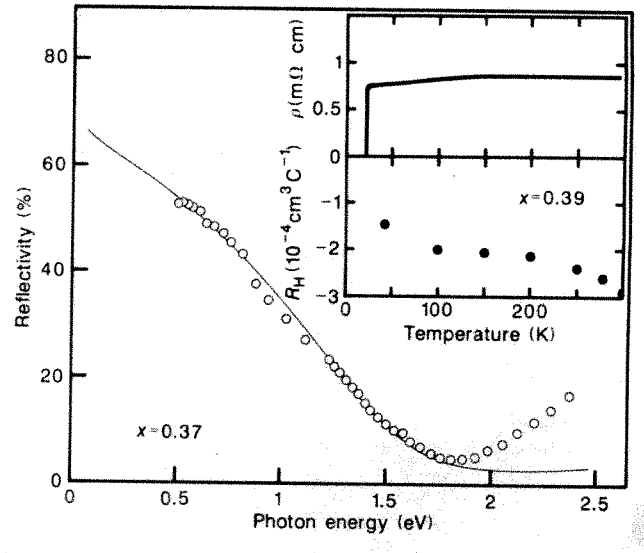

FIG. 2 The reflectivity spectrum for a 1,000-Å-thick film with $x = 0.37$ in the energy region from 0.5 to 2.4 eV. The solid line shows the spectrum calculated based on the Drude model with the plasma frequency $\hbar\omega_p = 1.59$ eV, the damping frequency $\hbar\gamma = 0.92$ eV and the optical dielectric constant $\varepsilon_\infty = 3$. The inset shows the temperature dependence of the electrical resistivity, ρ, and the Hall coefficient, R_H, of a thin film with $x = 0.39$ and a thickness of 3,000 Å.

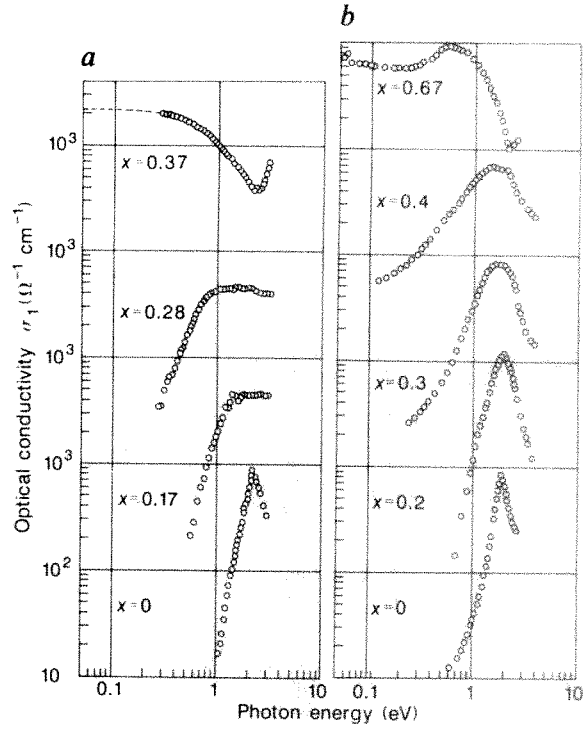

FIG. 3 *a*, Optical-conductivity spectra for $Ba_{1-x}K_xBiO_3$ thin films with $x = 0$ ($BaBiO_3$), 0.17, 0.28 and 0.37. The thickness of the films were 3,000, 20,000, 10,000 and 1,000 Å, respectively. The broken line in the spectrum for the film with $x = 0.37$ denotes the calculated spectrum below 0.25 eV using the Drude model with the parameters stated in the text. *b*, Optical-conductivity spectra for the $BaBi_{1-x}Pb_xO_3$ system obtained from the reflectivity spectra by means of a Kramers–Kronig transformation.

Bi atoms occupy the sites of a simple cubic lattice, but the oxygen octahedra surrounding Bi sites are alternately expanded and compressed (breathing-mode distortion), as observed in neutron-scattering experiments[14]. Such periodic lattice distortion leads to Bi^{3+}–Bi^{5+} charge ordering or charge disproportionation ($Bi^{4+} + Bi^{4+} \rightarrow Bi^{3+} + Bi^{5+}$), giving rise to so-called charge density waves (CDWs). As a consequence of CDW formation, an energy gap (Peierls gap) opens at the centre of the conduction band composed of Bi(6*s*)–O(2*p*) antibonding orbitals[15].

When Bi is partially substituted by Pb, the absorption peak is gradually broadened and shifts towards a lower energy with a tail extending to much lower energies. This has been attributed[16] to the formation of Pb states within the Peierls gap of $BaBiO_3$. The metal–insulator transition is considered to take place at 65% Pb substitution, when the Pb(6*s*) states fill up the energy gap. In this picture, the Peierls gap persists as a 'pseudogap' even in the metallic phase[4]. This is supported by the fact that the optical-conductivity spectrum for the metallic compound $BaBi_{0.33}Pb_{0.67}O_3$ retains the absorption peak.

The case of K doping is somewhat different. As in the case of Pb substitution, the absorption edge shifts towards lower energy with increasing K, clearly demonstrating a decrease in the optical energy gap. However, the optical conductivity still rises steeply without any appreciable low-energy tail and the edge shifts faster than in Pb-substituted compounds. Single-crystal X-ray analysis for compounds with little K substitution[5] shows two distinct Bi sites generated by a kind of breathing-mode lattice distortion. The optical spectrum suggests that the K-substituted compound is still a Peierls insulator but that the energy gap is reduced more rapidly by K-substitution. This is consistent with the fact that, in the $Ba_{1-x}K_xBiO_3$ system, the critical composition at which the metal–insulator transition takes place is $x = 0.35$, whereas it does so for $x = 0.65$ in the $BaBi_{1-x}Pb_xO_3$ system. The difference between the two systems arises from the difference in the electrostatic potential produced by the different substitutions in the parent compound $BaBiO_3$. It is inferred from the optical spectra that substituted Pb atoms give rise to energy states within the energy gap whereas K atoms do not.

The optical conductivity spectrum of the metallic compound with $x = 0.37$ is featureless below the plasma energy, suggesting that the energy gap would vanish almost completely at the insulator–metal transition, in contrast to the case of $Ba(Bi,Pb)O_3$ where the gap remains even in the metallic phase. This might be the reason for a lower T_c value ($T_c = 12$ K) in this compound.

Measurements of the Hall and Seebeck effects on metallic thin films give negative coefficients. The Hall coefficient, shown in the inset of Fig. 2, is -3.0×10^{-4} cm^3 C^{-1} at 300 K and the Seebeck coefficient is $-(1\text{–}2)$ μV K^{-1} in the temperature range 80–350 K. That the charge carriers are electrons is plausible if the energy gap vanishes and the resultant single conduction band is less than half-full as a result of K doping. Single-crystal X-ray diffraction[5] indicates that Bi sites remain equivalent, so there is no lattice distortion in the superconducting phase of $Ba_{1-x}K_xBiO_3$. In this respect the normal state of metallic $Ba_{1-x}K_xBiO_3$ seems completely different from that in copper oxide superconductors, in which the energy gap generated by the large Coulomb repulsive energy is preserved and the substitution of divalent for trivalent elements, for example Sr for La in La_2CuO_4, produces a hole in the lower split-off band.

The optical measurements on thin films of the $Ba_{1-x}K_xBiO_3$ system strongly suggest that K doping reduces the Peierls condensation energy in $BaBiO_3$ much more effectively than does Pb doping, and the metal–insulator transition in this system is directly related to the destruction of the Peierls gap, whereas in the $BaBi_{1-x}Pb_xO_3$ system the transition is driven by the growth of the Pb states within the Peierls gap. □

Changes of tropical sea–air interaction processes over a 30-year period

H. Flohn & A. Kapala

Meteorological Institute, University of Bonn, Auf dem Hügel 20, D-5300, Bonn, FRG

RECENT investigations[1–5] including radiosonde data from Southern India[6] have shown that the average tropospheric temperature in the tropics has increased since 1965 by nearly 1 °C. More importantly, the water vapour content of the middle troposphere has increased, above the equatorial Pacific, by 20–30%[4,5]. Here we report investigations on sea–air interaction processes along the main shipping routes of equatorial oceans—the only areas where there have been enough observations (Table 1) to provide a representative time series. The period 1949–79 was selected because of the general lack of bias in the air–sea parameters with the exception of wind speed. The results indicate an intensification of the hydrological cycle, especially over the warmest oceans and they also suggest tropical circulation changes.

The equatorial belt (10° S–10° N) covers an area of 88×10^6 km^2, with 77% being ocean. Along 14 sections of the busiest shipping routes (Fig. 1), about 2.4 million observations were selected from the trimmed COADS data[7], covering an area of nearly 8×10^6 km^2. We also intended to check the spurious increase[8] of wind speed. We evaluated the sea surface temperature (SST); the sea–air temperature difference (SST − AT); the saturation deficit ($q_s - q_a$, where q is the specific humidity at the sea surface, subscript s denotes saturation at the sea surface, subscript a, saturation in the air), and the scalar wind speed, v_{scal}. Preliminary results[9] indicate high spatial variability of all sea–air parameters. This was true even on adjacent sections crossing the Equator where all observations had been made on board the same ships with the same equipment (Table 1) which suggests that the wind speed data show real changes as well as the effect of some biases[8]. The saturation deficit ($q_s - q_a$) increases nearly everywhere, with varying intensity; similarly the sea–air temperature difference increases but with regional and seasonal variations. The cross-equatorial changes are particularly large along routes 3–4 and 9–10, where the southern

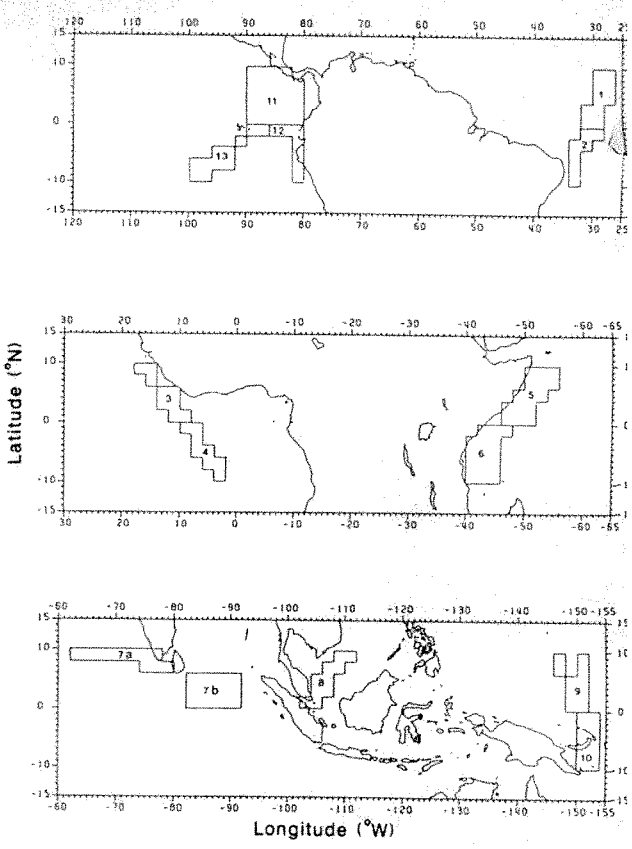

FIG. 1 Map of the selected 14 sections of ship routes in the equatorial belt

sections are affected by seasonal upwelling.

Table 2 gives 31-yr averages and trends from three region groups: the Atlantic (sections 1–4); the warmest oceans (60° 180° E, sections 7*a*, *b*–10); and the eastern Pacific (11–13). Th zonal average (14 sections) is not fully representative, becaus many routes are in areas with cool water upwelling. For com parison, SST averages from our sections are supplemented b true averages (SST*), using all 4×4° COADS fields (J. C Fletcher, personal communication). The most interesting result are from the warmest oceans on both flanks of Indonesia. I 11 of 14 sections the SST − AT trend is positive, with 7 significar

the 95% level. The saturation-deficit trend is significantly positive in sections 6–9; here the 31-yr trend amounts to 0.72 g kg^{-1} or +14%. Including wind speed, these values (Table 2) are physically coherent; the strongest positive trends of SST and ($q_s - q_a$) (Fig. 2) are observed in the warmest areas. These parameters indicate a destabilization of the marine boundary layer, which cannot be systematic error (for instance, the increasing size of ships). The individual points on Fig. 2 suggest that the trends are not affected by the frequency of cold or warm El Niño–Southern Oscillation (ENSO) events.

Recent satellite measurements[10] show high correlations between ($q_s - q_a$) and evaporation (E); and weaker correlations between v_{scal} and E. This coincides with the increasing moisture in the midtroposphere (500–700 hPa, 1 hPa = 1 mbar) above the Pacific, as discussed in refs 4, 5. Here precipitable water has increased at four stations (each significant at 95%), by up to 30% from 1965 to 1984.

The simultaneous increase of SST and atmospheric moisture can be understood following recent investigations[11,12] which have revealed a nonlinear increase in the heights of convective

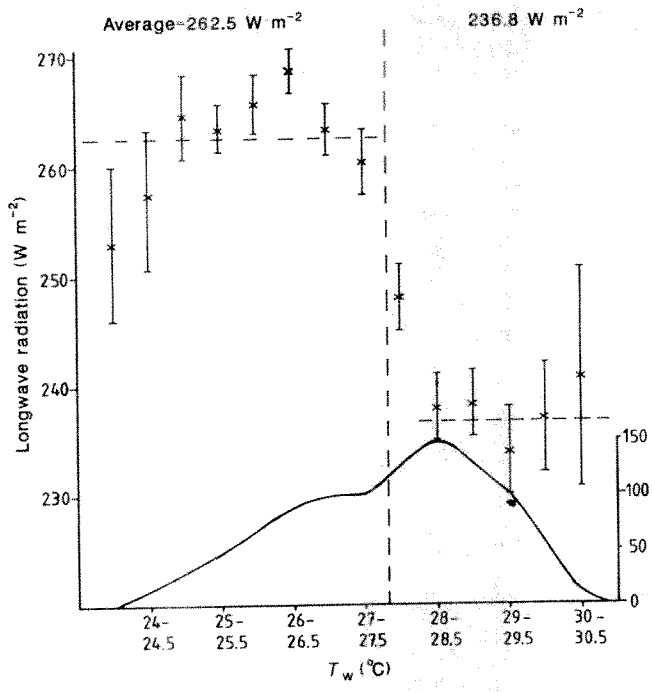

FIG. 3 Outgoing longwave radiation—representing cloud-top temperature and height—as a function of SST (T_w) at the surface of the equatorial Pacific Ocean[11]. Lower curve denotes frequency of cases.

cloud tops with increases in SST. The statistics (Fig. 3) show a jump between high, cold and low, warm cloud tops near SST = 27.5 °C. Strong convective activity driven by low-level convergent winds[12] transports water vapour to the upper troposphere, where latent heat is released by condensation. An evaluation from COADS-based data yields an ocean area of $\sim 65 \times 10^6$ km^2 with SST > 27.5 °C. With a warming of 0.39 °C over 31 years (Table 2) this area has grown, over this period, by $\sim 13 \times 10^6$ km^2 or 20%. Such figures seem to hold the key for understanding such rapid development even assuming no variation of the wind field.

These changes of sea–air parameters are correlated with an increase in E. Disregarding absolute values of E, we may estimate, on the basis of the well known bulk formula[13] the relative changes between 1949 and 1979. Assuming no change of wind speed (which is unlikely), we obtain from the $(q_s - q_a)$ trend alone an increase of E over the 'warmest' oceans of ~10%; if we allow an increase in v_{scal} of 0.25 m s^{-1}, the rise in E amounts to ~15% in 31 years. As the 1927 Beaufort wind scale used in COADS data has to be shifted upward (by 1.4–2.0 m s^{-1} after comparison with measurements in different latitudes[13–15], it is necessary to add a correction of ~+1.5 m s^{-1} to the average COADS wind speeds. Then the additional energy input from release of latent heat into the atmosphere is 10–15 W m^{-2}. This should be compared with a global value of 2–2.5 W m^{-2} from the increase in CO_2 and other greenhouse gases[16], not accounting for feedback mechanisms, since the beginning of this century. Similar ratios have been estimated before[17–19].

Independently two recent climate models have indicated a heating maximum in the tropics[19,20]. Recent model studies have also found that positive feedback coefficients operating by means of water vapour and clouds (primarily in the tropics) are distinctly higher than the snow-albedo feedback[21].

This recently discovered powerful heating source in the equatorial belt is concentrated over the eastern Indian Ocean and Western Pacific. Here the upper mixed layer of the ocean is effectively isolated from exchange with the cool layers below, owing to the great depth of the mixing layer and the lack of effective upwelling. The rise of SST, of $(q_s - q_a)$ and of E together with the increase in tropospheric temperature and moisture[4] are consistent with a strengthening of the subtropical 700-hPa westerlies in the Pacific section[22]. This suggests an intensification of the Hadley circulation in that section and has been confirmed by our investigations at 200- and 500-hPa levels (to be reported elsewhere).

If we consider the zonal SST differences between the warmest oceans and sections 11–13 as representing the Walker circulation, our data (Table 2, upper panel) show an increase of this SST difference of 6%; no radiosonde time series are available at the Equator. Land data indicate, for 1950–80, no significant trend[23] at latitudes 35–60° N. In the Indian Ocean, therefore, the rise of SST and of the heating rate (indicated by SST − AT) at sections 5, 7a and 7b (Table 2, lower panel) suggest a decrease (increase) of the meridional land–sea difference during summer (winter) that drives both monsoons in these sections. Taking into account (as above) an estimated real increase of surface wind speed +0.25 m s^{-1}, the wind data reveal a weakening of the summer monsoon and an intensification of the winter monsoon.

It seems that the warming of the tropical troposphere can be associated with more frequent deep convection correlated with SST > 27.5 °C releasing more latent heat into the atmosphere. The physical role of water vapour is not only due to its (radiative) greenhouse effect, but even more to its phase changes[16,18]. This provides an additional energy input to the atmosphere. The resulting positive feedback leads to an acceleration of the delayed ocean warming in low latitudes[19,20], to a strengthening of most tropical circulations and perhaps also to a greater frequency and/or intensity of warm ENSO events.

Because we have only short observation periods, we refrain from extrapolating these trends into the future. However, the search for a warming signal should be directed primarily at the tropics, instead of higher latitudes.

In the upwelling regions of the tropical oceans, the sea–air fluxes of CO_2 and H_2O are nearly simultaneously intensifying and weakening[24], during ENSO cycles. Among other considerations, this also suggests that the manmade increase in the atmospheric CO_2 concentration could be the primary trigger of a chain of processes within the tropical branch of the climate system. At present, we do not wish to speculate about the possible consequences of such an increase of the hydrological cycle in a key area of the climate system. We wish to bring the observed signal to the attention of others concerned with global warming. □

Impact production of CO_2 by the Cretaceous/Tertiary extinction bolide and the resultant heating of the Earth

John D. O'Keefe & Thomas J. Ahrens

Seismological Laboratory, California Institute of Technology, Pasadena, California 91125, USA

EVIDENCE at the Cretaceous/Tertiary boundary suggests that the proposed 'extinction' bolide[1] struck a continental or shallow marine terrane. This evidence includes: shocked quartz and feldspar grains found in the boundary layer inherited from a range of rock types[2,3]; a high $^{87}Sr/^{86}Sr$ ratio in some planktonic fossils[4] which could reflect continental-derived Sr (ref. 5); and evidence that the platinum-group-element-rich clay layer is underlain (at some localities) by a deposit of possible tsunamic origin[6,7]. These observations and data demonstrate that sea level at the end of the Cretaceous was ~150–200 m higher than at present, suggesting the possibility that the extinction bolide struck a shallow marine carbonate-rich sedimentary section. Here we show that the impact of such a bolide (~5 km in radius) onto a carbonate-rich terrane would increase the CO_2 content of the atmosphere by a factor of two to ten. Additional dissolution of CO_2 from the ocean's photic zone could release much larger quantities of CO_2. The impact-induced release of CO_2, by itself, would enhance atmospheric greenhouse heating and give rise to a worldwide increase in temperature from 2 K to 10 K for periods of 10^4 to 10^5 years.

Many impact-induced phenomena have been suggested to exert a climatic effect. Alvarez *et al.*[1] proposed that the shielding of the Sun by dust injected into the atmosphere following a land impact would exert such an influence on global climate; this was later explored by others[8–10]. There is now good evidence that large amounts of soot, possibly from shock-induced forest fires, occur in the Cretaceous/Tertiary (K/T) layer[11]. An impact into the ocean can also induce a short-lived (< 0.1 year) greenhouse effect caused by water vapour[12]. The impact-driven atmospheric shock wave would produce large quantities of NO_x (refs 13–15), which could deplete the ozone layer through photochemical processes. Acidification of the atmosphere and land and ocean surfaces is also expected[16], which would result in increased atmospheric CO_2 upon dissolution from the ocean surface. Enhanced absorption of solar radiation by NO_x and CO_2 can affect the atmospheric thermal-radiation balance, and hence global climate.

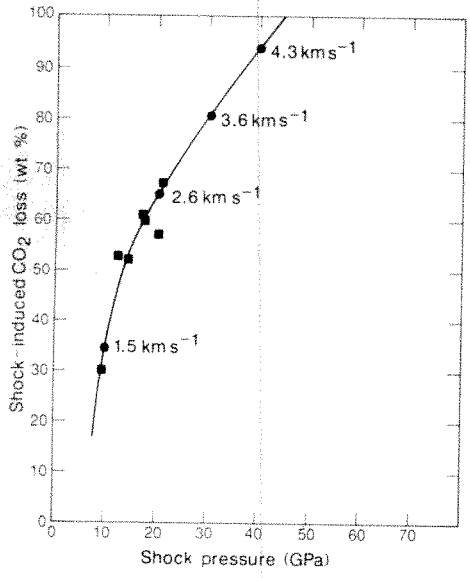

FIG. 1 Fraction of CO_2 released from calcite as a function of impact pressure[17] (squares). The solid line shows theoretical calculations, and corresponding impact velocities are indicated for shock pressures of 10, 20, 30 and 40 GPa (circles).

The amount of CO_2 released by impact-induced shock pressures in carbonate minerals can be estimated using the experimental results of Lange and Ahrens[17] and the impact scaling relations of O'Keefe and Ahrens[18]. Lange and Ahrens performed a series of laboratory impact experiments in which they measured the amount of CO_2 released as a function of peak shock pressure (Fig. 1). They found that the threshold shock pressure required to induce devolatilization of $CaCO_3$ to CaO and CO_2 is ~10 GPa.

The volume of vapour (V_v) relative to the volume of the impactor (V_m) is given by

$$\frac{V_v}{V_m} = 0.132\left(\frac{\rho_m}{\rho_s}\right)\frac{U^2}{\Delta E} \quad (1)$$

where ρ_m and ρ_s are the densities of the impactor and planetary surface, U is the velocity of impact and ΔE is the energy of vaporization; for silicates, $\Delta E \approx 0.2\times10^{12}$ erg g^{-1} (ref. 18). The effective energy of devolatilization of calcium carbonate was derived by scaling this energy of vaporization by the ratio of the pressures for incipient impact devolatilization:

$$\Delta E_{CaCO_3} = 0.2\times10^{12}P^v_{CaCO_3}/P^v_{sil} = 9.5\times10^9 \text{ erg g}^{-1} \quad (2)$$

where $P^v_{CaCO_3}$ and P^v_{sil} are the threshold pressures for incipient vaporization of calcite and silicates, respectively. We used this value of ΔE in equation (1) to calculate the volume of CO_2 produced.

The scaling relation given by equation (1) was derived from calculations of impact upon a homogeneous planet. Carbonate-rich sections are expected to range in thickness up to 4 km. For large-scale impacts (impactor radii > 5 km) the peak shock pressures are expected to completely devolatilize the carbonate-rich layer. Because the shock impedances of carbonate rocks are similar to those of silicates, the shock trajectories and pressures do not differ significantly between a homogeneous silicate planet and a carbonate sequence overlying a silicate half-space. With this assumption, the volume, V_L, of the carbonate layer that would be devolatilized is

$$V_L = \pi[R_v^2 d - \tfrac{1}{3}d^3] \quad (3)$$

where R_v is the radius of the region that is shocked to pressures sufficient for devolatilization and d is the mean thickness of the carbonate layer. Here R_v is given by

$$R_v = \left(\frac{6}{4\pi}V_v\right)^{1/3}$$

Our model has two layers: a carbonate-rich layer, which was assumed to be either 1 or 4 km thick, and an underlying silicate rock core. Less than one-half of the Earth's surface, comprising moderate-depth oceanic terrane or continental-shield terrane, is represented by a thin (1-km) carbonate layer, whereas the small fraction of the Earth's surface which has thick sections of shallow marine sediments[19] is represented by a 4-km layer. The total carbonate reservoir of the Earth, 7×10^{22} g, would provide a 400-m-thick layer covering the whole Earth[20]. We examined the effect of including an ocean with a depth of less than 3 km and concluded that for impactors with radii greater than 1 km, the ocean does not significantly affect the amount of CO_2 released. Our results for the mass of CO_2 evolved as a function of impactor size are shown in Fig. 2. Two types of impactors were considered; asteroids with a density of 3 g cm^{-3} and a velocity of 20 km s^{-1}, and comets with a density of 1 g cm^{-3} and a velocity of 60 km s^{-1}. The mass of CO_2 released exceeds

the present-day atmospheric content of 2.7×10^{18} g when the radius of asteroid impactor is greater than 3.1 and 6 km for a 4- and 1-km-thick carbonate layer respectively, and when the corresponding radius of a comet impactor is greater than 2.1 and 4.2 km. On the basis of the iridium content at the K/T boundary layer, Alvarez *et al.*[1] estimated the minimum radius of the K/T asteroid to be 5 ± 2 km. The radius of a cometary impactor must be 1.4 times that of an asteroidal impactor to give the same effect. For the above range of K/T impactor radii, it is clear that significant amounts of CO_2 can be ejected into the atmosphere.

In the case of impactors whose radii are of the order of a fraction of the atmospheric scale height (~7 km), the devolatilized CO_2 would be dispersed rapidly and globally. In contrast, the CO_2-depleted rock is expected to remain buried in the crater and its recarbonation must be retarded by the overlying ejecta blanket. Roddy *et al.*[21] and O'Keefe and Ahrens[22] have calculated the flow fields in the Earth and atmosphere that would result from the impact of a 5-km-radius bolide causing the K/T event. Although neither calculation included explicitly the effects of CO_2 devolatilization, it can be inferred from the geometry and evolution of the flow fields of the Earth and atmosphere that the evolved CO_2 would be propelled upward from the impact site and be distributed globally.

The sudden injection of CO_2 or water into the atmosphere will increase the Earth's mean surface temperature through the greenhouse effect[23]. The time required for the atmosphere to heat up by either mechanism is much less than the radiative cooling time (~3 days). The re-equilibration time of the solid-Earth/ocean/atmosphere system to a sudden large increase in CO_2 in the atmosphere is relatively long, whereas the re-equilibration time for an increase in atmospheric water is in the range of months to several years[12].

The re-equilibration of CO_2 by dissolution in the deep ocean water or dissolution of deep-sea sediments may occur on timescales of 10^3 to 10^4 years (ref. 24). Reaction with crustal rock is thought to occur through the rock-weathering reaction

$$CaSiO_3 + 2CO_2 + H_2O \rightarrow Ca^{2+} + SiO_2 + 2HCO_3^-$$

with Ca^{2+} and HCO_3^- subsequently removed by carbonate precipitation from sea water on a timescale of 10^5 years (ref. 25). Surface sea water is at present supersaturated with respect to bicarbonate ion, and an increase of the ocean surface temperatures, as well as production of NO_x and its subsequent uptake by the oceans, is expected to release additional CO_2 to the atmosphere[16,26].

We used the results of Kasting and Ackerman[27] to obtain the temperature rise at the Earth's surface as a function of CO_2 content and to calculate the temperature rise as a function of the size of the impactor from the conditions shown in Fig. 3. The increase in temperature as a function of mass of CO_2 in the atmosphere is given by $\Delta T = 10 \log_{10} m/m_0$, where m is the mass of CO_2 in the perturbed atmosphere and m_0 is the mass of CO_2 in the normal atmosphere[27]. The amount of CO_2 obtained in Fig. 2 is conservative, as it comes only from impacted carbonates and includes neither the effect of additional CO_2 expected from surface heating or acidification of the ocean[28], nor that induced by biomass destruction. Figure 3 indicates that the temperature change calculated is significant (>~5 K) for impactors greater than 3 km in radius. Emiliani *et al.*[12] have argued that the intolerance of large families of biota to increases in temperature of ~10 K would be sufficient to account for the K/T extinctions. Moreover, if such a temperature excursion remained for $>10^3$ yr, then global oceanic warming would also occur and major and complex changes in oceanic currents would result. This may be reflected in the generally unsteady and poorly correlated values of $\delta^{18}O$ measured for planktonic foraminifera tests over the first 10^5 yr of the Tertiary[29,30]. The most compelling evidence for a long period of extended CO_2-enrichment of the atmosphere, and by inference, an extended global temperature increase, stems from the 10^3–10^4-yr period of ^{13}C-depleted surface foraminifera tests and the concurrent absence of the usual relationship between heavy carbon ($\delta^{13}C = +3$ at the surface) and light carbon ($\delta^{13}C = +1$ at depth) measured in the normal biologically active ocean.

Emiliani *et al.*[12] and McLean[31] have also concluded from a palaeontological evidence of extinctions in marine fauna at the K/T boundary that the mean temperature increased at, or immediately after, the extinction event. We note that the decrease in $^{13}C/^{12}C$ ratio of the planktonic foraminifera appears to extend for 10^4–10^5 yr after the K/T event[32], in general agreement with the extinction timescale proposed by Hut *et al.*[33]. This is considerably longer than the time interval of $<10^3$ yr associated with deposition of the platinum-group-element layer. The extended 10^4–10^5-yr extinction interval is not easily explained by theories of aerosol atmospheric loading or by a water-induced greenhouse effect. Our calculations indicate that an enhanced atmospheric greenhouse effect caused by a large impact-devolatilization-induced increase in atmospheric CO_2 would result in significant heating of the Earth, causing a lengthy period of mass extinctions. □

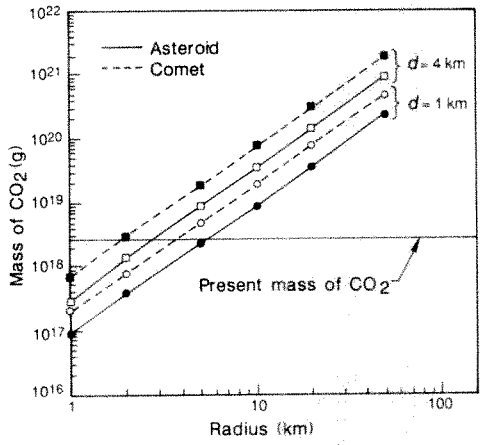

FIG. 2 Mass of CO_2 released during an impact from a carbonate sediment. The impact velocity is 20 km s^{-1} and the density of the impactor is 3 g cm^{-3} for an asteroid and 1 g cm^{-3} for a comet. The carbonate thickness, d, is either 1 or 4 km.

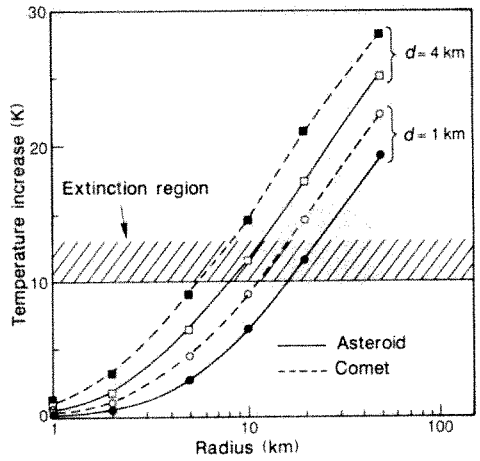

FIG. 3 Mean rise in atmospheric temperature as a function of impactor radius. Impact conditions are described in Fig. 2. The extinction region[1,2] is indicated.

Parental care and mating behaviour of polyandrous dunnocks *Prunella modularis* related to paternity by DNA fingerprinting

INDIVIDUALS are often assumed to behave so as to maximize their reproductive success[1] but unambiguous determination of parentage is difficult, especially in species with complex social systems where a female may mate with several males and where there may also be intraspecific brood parasitism[2–4]. Even in apparently monogamous species, extra-pair paternity can be common[5–7]. DNA fingerprinting[8–11] promises to revolutionize field studies by providing a powerful method for determining paternity and maternity[12]. Here we use this technique to link observations of mating behaviour and parental care with precise measurements of reproductive success. We show that in the dunnock *Prunella modularis*, a small passerine bird with a variable mating system[13,14], males do not discriminate between their own young and those of another male in multiply-sired broods. Nevertheless, they increase their own reproductive success by feeding offspring in relation to their access to the female during the mating period, which is a good predictor of paternity.

We studied a colour-ringed breeding population of about 80 dunnocks in the Cambridge University Botanic Garden[14–16]. Some female territories were defended by one male (monogamy), others by two, unrelated males (polyandry). Sometimes two males jointly defended the territories of two or three adjacent females (polygynandry). Where two males shared the defence of one or more female territories, one (alpha) was clearly dominant and able to displace the other (beta) from the female's vicinity[14].

In 1988 we observed females from the time they completed nest building until the start of incubation (6–10 days), which is the period when copulations occur[15,16] (mean observation time 4.02 h, $N = 34$). Monogamous males spent on average 81.1% of their time within 10 m of the female (range 62.1–97.3%, $N = 10$). Mate guarding was very effective; intruders were seen to gain exclusive access to the female (defined as the presence of only one male within 10 m) in only 3 of the 10 cases, a total of only 3 min in 23.98 h observation (mean for the 10 cases = 0.17% observation time).

By contrast, there was intense competition for matings when two males shared a female. Alpha males attempted to guard the female and prevent the beta male from gaining access, but this was difficult because beta males were often very persistent and, furthermore, females attempted to escape the alpha males' close attentions and encouraged beta males to mate[16]. In 8 out of 11 cases of polyandry and 10 out of 13 cases of polygynandry, the beta male had some exclusive access to the female. There was no significant variation in the proportion of exclusive access gained by alpha or beta males at different stages of the mating period and the mean copulation rate during periods of exclusive access was no different for alpha males (1.98 per h) and beta males (2.15 per h; $N = 16$; Wilcoxon matched pairs test, NS). Exclusive access time therefore gave a good measure of mating success and was easier to record than copulations. As in monogamy, intruding males gained very little exclusive access (only 3 out of 24 cases, a total of 5 min in 112.7 h; mean of 0.05% observation time).

As expected from our mating observations, DNA fingerprinting (Fig. 1) shows that intruding males gained little success; of 133 young (45 broods) all but one were fathered by a resident male. The exception is a case of polyandry where one chick from a brood of four was fathered by an alpha male from a neighbouring territory. All chicks from monogamous mating systems were sired by the resident male, whereas in polyandry and polygynandry paternity was often shared between alpha

TABLE 1 Analysis of paternity by DNA fingerprinting for three dunnock mating systems

Mating system	% Total young (*n*) fathered by		Mean % paternity per nest (*n*)		Details for each nest: proportion fathered by $\alpha\delta$
	$\alpha\delta$	$\beta\delta$	$\alpha\delta$	$\beta\delta$	
Monogamy (1♂ 1♀)	100	— (49)	100	0 (15)	4/4, 4/4, 4/4, 4/4, 4/4, 4/4, 3/3, 3/3, 3/3, 3/3, 3/3, 3/3, 3/3, 2/2, 2/2.
Polyandry (2♂ 1♀)	52.9	44.1 (34)*	49.2	48.5 (11)*	4/4, 3/4*, 3/3, 2/2, 2/4, 1/4, 1/4, 1/3, 1/3, 0/2, 0/1.
Polygynandry (2♂ 2♀; 2♂ 3♀)	72.0	28.0 (50)	68.4	31.6 (19)	3/3, 3/3, 3/3, 3/3, 3/3, 2/2, 2/2, 2/2, 1/1, 3/4, 3/4, 2/4, 2/4, 2/3, 1/3, 1/2, 0/2, 0/1, 0/1.

The proportions of young sired by the two males in polyandry and polygynandry are not significantly different. All but one of the 133 young were fathered by a male resident on the territory.

* One chick was fathered by a male on a neighbouring territory (see Fig. 1 legend).

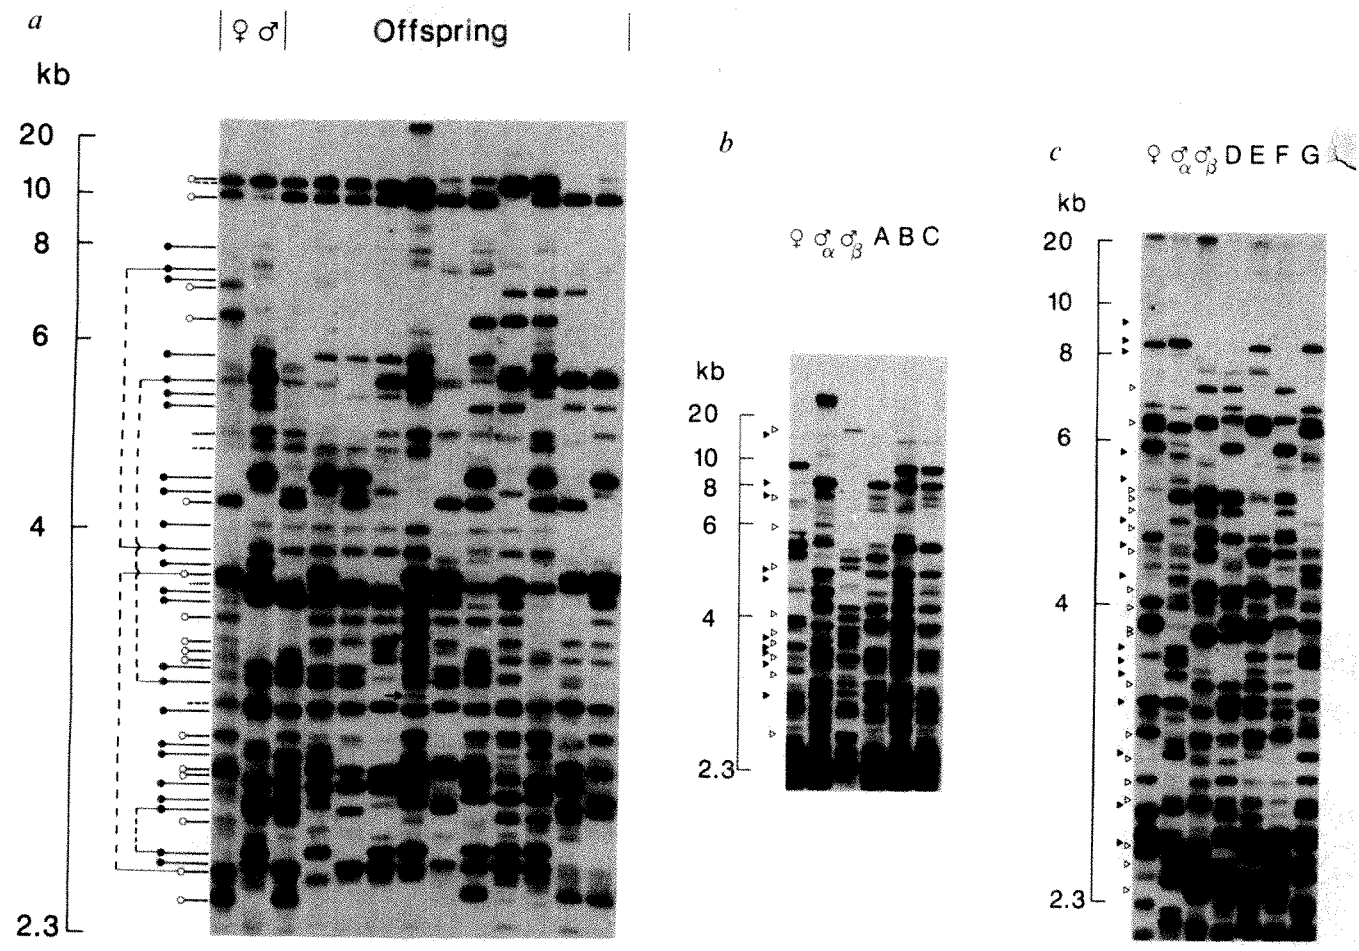

FIG. 1 Example dunnock DNA fingerprints obtained with probe 33.15 (ref. 8). *a*, Monogamous pair and 11 offspring (3 broods). DNA fragments of 'almost identical' (·····) and 'apparently identical' (– – –) mobility are indicated. Segregation analysis[9,17] of the other 40 resolved maternal (○) and paternal (●) heterozygous fragments larger than 2.3 kb revealed a transmission frequency of 0.495, four apparently allelic pairs (joined by – – –), and no consistent cosegregation; hence the bands probably represent dispersed hypervariable minisatellite DNA sequences[9,17]. *b*, Polyandry (exclusive paternity): brood where alpha male sired all three nestlings A, B, C. *c*, Polyandry (mixed paternity): brood where beta male sired nestlings D, E, F, and alpha sired G. Markers indicate paternal male-specific (diagnostic) alpha (►) and beta (▷) bands.

METHODS. DNA was extracted from blood (40–100 μl, from brachial veins of adults and 7-day-old nestlings into 1×SSC, 10 mM EDTA pH 7.0), digested with *Alu*I, and fingerprints obtained as previously described[9] except: 5 μg ethidium bromide was added per sample, gels were 0.8% (20-cm long) or 1.0% (30-cm long) agarose in 1×TBE, and hybridizations, at 64 °C, excluded competitor DNA. The probability of band sharing (x) between individuals[9] (conservatively found from 20-cm gels, including 'almost identical' bands) = 0.24 ± 0.10 s.d. (N = 17); bands per fingerprint (n) = 23.2 ± 4.1 s.d. (N = 29); hence mean allele frequency[18] (q) = 0.13. For trios, fathers were initially assigned by the presence of diagnostic bands in each nestling (range 2–13, mean 7.4 ± 2.5 s.d., N = 75). In three nestlings, one or two (arrowed in *a*) bands absent in both parents were considered mutant[19] as band sharing was otherwise greater than expected for a misassigned random adult ($P_1 < 0.01$, $P_2 < 0.001$, $P_3 < 0.05$); apparent mutation rate = 10^{-4}. For the other 130 offspring $n \geq 12$; it is extremely unlikely that all 12 fragments would be present in a random pair[20] as $P = (1-(1-x)^2)^n = 3.3 \times 10^{-5}$. We concluded that no intraspecific brood parasitism, at least by non-relatives, occurred and that all mothers were correctly identified. Obligate paternal-derived bands could therefore be inferred in all offspring (range 5–18, mean 9.9 ± 2.8 s.d., N = 133). The probability of an unrelated male containing all these m fragments, $P = x^m$, in each case lay between 8.0×10^{-4} (m = 5) and 7.0×10^{-12} (m = 18); similarly for a close relative (brother, father and son)[21], $P = ((1+x)/2)^m = 0.092$ to 1.8×10^{-4}. Demographic data[14] also shows that close relatives are very unlikely to become neighbours. In the one case of a nestling sired by an intruding male the female shared 14 of 25 offspring bands ($P < 0.001$) and the assigned male contained all 11 paternal specific bands ($P < 2 \times 10^{-7}$), which is also significantly more than if he were the actual father's brother (expected band sharing[9] = $1-(1-((1+x)/2(2-q)))(1-q) = 0.42$, $P < 0.001$).

TABLE 2 Association between paternity, feeding of nestlings and access to the female during the mating period for alpha and beta males in polyandry and polygynandry

Paternity (from DNA fingerprinting)	Behavioural observations: Male fed young	Male did not feed young	Male had some exclusive access to female	Male did not have exclusive access to female
Alpha male				
Broods where he had paternity	23	1	13	0
Broods where he had no paternity	2	3	4	1
	P = 0.011*		Sample size too small to test	
Beta male				
Broods where he had paternity	14	3	10	0
Broods where he had no paternity	4	8	2	6
	P = 0.011*		P = 0.005*	

Chick feeding by males was recorded for 29 out of the 30 nests in Table 1; we had observations during the mating period for 18 of these cases. We recorded 90% cases where beta males fed the young, and 85% cases where they had some exclusive mating access, within the first hour of observation, so observation times (see text) were sufficient to give reliable measures.

* Fisher exact probability test.

nd beta male (Table 1). Maternity was assigned in all cases to ıe resident female, so there were no cases of intraspecific brood arasitism.

In all 15 cases of monogamy, the young were fed only by the ıonogamous male and female. In the 30 cases of polyandry nd polygynandry where we recorded chick feeding, the female ed the young at all 30 nests, helped by both males in 14 cases, y the alpha male only in 11 cases (in one of these the beta ıale died during incubation), by the beta male only in 4 cases in one of these the alpha male died) and in one case the female ot no male help (mean observation time per nest = 4.35 h, V = 45).

DNA fingerprinting showed that males were more likely to ıelp feed the young if they had paternity (Table 2). Two results ndicate that this association does not arise because males can ecognize their own offspring. First, in two cases the alpha male ed nestlings even though he had no paternity and in four cases he beta male did so. (In two cases both helped to feed a single :hick.) Second, after fledging, broods were often divided among he parents with each adult taking sole care of some young for ı further 2 weeks until they became independent. There was no endency for males to pick out their own young. We observed 28 dependent fledglings, from 12 broods where both alpha and ɔeta males had helped to feed the nestlings; 11 young were sired ɔy the alpha male, of which 5 were fed by their father and 6 by :he beta male, whereas 17 were sired by the beta male, of which 9 were fed by their father and 8 by the alpha male.

How, then, does the association between chick feeding and paternity come about? A male's access to the female gives a good prediction of his chances of paternity (Table 2), and males apparently use mating access to determine whether they feed young. Including data from all polyandrous and polygynandrous mating systems observed in 1981–88, beta males fed the young in 22 of the 27 cases where they had some exclusive access during the mating period, compared with only 1 out of 11 cases where they were not observed to have access ($P < 0.001$). Furthermore, beta males brought a greater proportion of the male feeds where they had had a greater proportion of the exclusive access time during the mating period (Fig. 2).

Females benefit by copulating with two males because chicks are fed more, and more survive with the help of two males rather than one[22]. An alpha male, however, would need at least 60–70% of the paternity in trio-fed broods for co-operative polyandry to bring greater reproductive success than monogamy[23]. For 20 broods where both males in polyandry and polygynandry had access to the female during the mating period, or both fed the young (and so, by implication, both had had access), the mean paternity split was 55.0% alpha, 45.0% beta (total of 58 young, 56.9% sired by the alpha male). This suggests that alpha males do not achieve the critical proportion above which it would pay them to share the female, and explains why although females encourage the presence of beta males, alpha males attempt to drive them away[23]. □

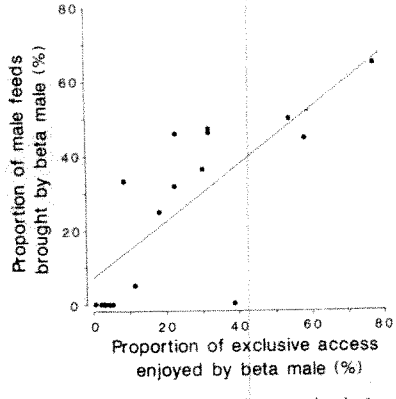

FIG. 2 Relationship, for polyandry and polygynandry, between the proportion of exclusive access time with the female by the beta male during the mating period, and the proportion of male feeds brought by the beta male to the nestlings. Exclusive access time is the total time that either the alpha or beta male was the only male within 10 m of the female. Data from 1981–88 for cases where beta males gained some exclusive access ($y = 5.75 + 0.798x$: analysis on log-transformed data: $r = 0.775$, 15df, $P < 0.01$; the slope does not differ significantly from 1, $t = 1.33$, 15df). In polygynandry, a male's provisioning of the young at one nest may be influenced by the activities of other females in the mating system,[16,22] so cases where other females were laying or had young simultaneously were excluded.

Incubation period of AIDS in San Francisco

Peter Bacchetti & Andrew R. Moss

Department of Epidemiology and Biostatistics, University of California, San Francisco, California 94143, USA

IN a closed population, the distribution of AIDS diagnoses over time is the convolution of the distributions of human immunodeficiency virus (HIV) infections and the incubation period. This has motivated estimates of the infection distribution, assuming known diagnosis and incubation distributions[1], but the usefulness of this method is limited by uncertainty about incubation[2–4]. The large amount of information on the distribution of HIV infections in San Francisco's gay community suggests the opposite approach—estimating the incubation distribution, assuming known infection and diagnosis distributions. A non-parametric implementation of this strategy produced an estimate with a median at 9.8 years, increasing hazard rates, and less uncertainty than previous estimates.

Data are available for seroconversions rather than infections, so we estimated the time from seroconversion to AIDS diagnosis[5]. (Seroconversion may occur later than infection[6].) Figure 1*a* shows estimated seroconversion rates from three sources, and Fig. 1*b* shows the overall seroconversion and diagnosis patterns that we used. The dramatic drop in seroconversion by 1984 was paralleled by rectal gonorrhea rates among males at the same time[7], presumably because of behaviour change. The effect of such change on HIV infections would have been enhanced by the saturation of high-risk subgroups[8]. This further

TABLE 1 Estimates of the incubation period of AIDS

Estimate	Median (yr) (95% CI)	Per cent with AIDS by 9 yr (95% CI)
Present study	9.8 (9.4, ∞)	45 (42, 47)
Penalized 15% for uncertainty in seroconversion pattern	(8.6, ∞)	(36, 54)
Parametric analysis of US transfusion data[3]	7.3 (4.6, ∞)	Not given
Parametric analysis of data from 84 men in the San Francisco City Clinic Cohort[2]	7.8 (4.2, 15.0)*	65 (not given)
Nonparametric analysis of data from 181 men in the San Francisco City Clinic Cohort[15]	Not given	42 (30, 54)†

* Estimated mean and 90% confidence interval (CI).
† Confidence interval does not reflect uncertainty resulting from imputing exact seroconversion times from interval-censored data.

corroborates the drop shown by all three sources in Fig. 1*a*. Mathematical models of epidemic spread in a susceptible population[8] corroborate the early rapid rise.

Treating the distributions in Fig. 1*b* as known allows estimation of the incubation distribution. In particular, we wish to estimate parameters h_k, the hazard rates for developing AIDS k months after seroconversion. With 10 years worth of data, h_k can be estimated for $k=0$ to 120. Let $d_{j,k}$ be the number of persons who seroconverted in month j and were diagnosed in month k. If all the $d_{j,k}$ were known, then the maximum likelihood estimate of h_k would be

$$\hat{h}_k = e_k / r_k \qquad (1)$$

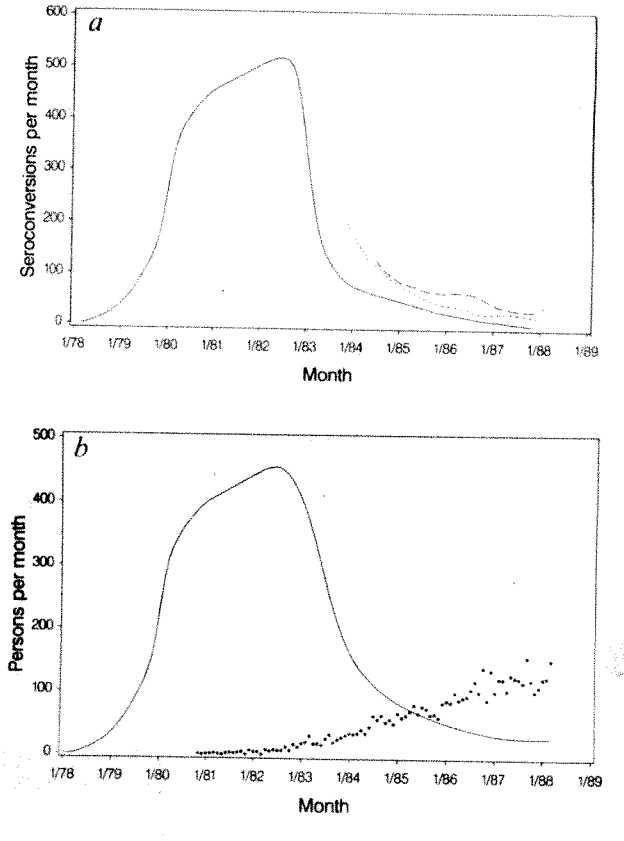
where $e_k = \sum_{j=0}^{120-k} d_{j,j+k}$ is the number of persons diagnosed exactly k months after seroconversion, and r_k is the number of persons still free of AIDS $(k-1)$ months after seroconversio Although the $d_{j,k}$ are unknown, we can use the EM algorithm to estimate the h_k. The algorithm begins with arbitrary initi values of the h_k and calculates the expected values of the d conditional on the initial h_k and the known seroconversion an diagnosis patterns. The expected values are used in place of t unknown $d_{j,k}$ in equation (1) to yield refined estimates of th h_k. The refined h_ks lead to new expected values, which yiel new estimated h_ks, and so on. The algorithm continues unt the estimates converge.

Because it is biologically reasonable that the hazard change smoothly over time, we used a modification of equation (1):

$$\hat{h}_k = \sum_{i=k-6}^{k+6} e_i \Big/ \sum_{i=k-6}^{k+6} r_i \qquad (2$$

This is a local likelihood estimate[10] with a span of 13. (Thi span was the smallest that produced acceptably smooth esti mates.) In addition to ensuring reasonable smoothness, thi modification also reduced the estimate's variability and led t faster convergence, while still being non-parametric. Figure shows the estimates that resulted from applying this method t the distributions in Fig. 1*b*. The estimated probabilities o developing AIDS during the first to tenth years followin seroconversion were 0.002, 0.007 0.022, 0.043, 0.061, 0.073, 0.082 0.081, 0.074 and 0.067, respectively. The estimated distributior is an average for all gay men in San Francisco. It may well diffe for subgroups of this population, and it may change as prophy laxis of seropositives becomes more widespread before diag nosis.

The confidence intervals in Fig. 2 do not reflect the uncertainty that results from estimation of the seroconversion pattern. Multiplying the seroconversion curve in Fig. 1*b* by a factor (or dividing the diagnosis curve by a factor) would divide the curve in Fig. 2*a* by the same factor. As the estimated number of seroconversions may be too high or too low by 10% (ref. 11), the curve in Fig. 2*a* could plausibly be multiplied by 0.9 or 1.1.



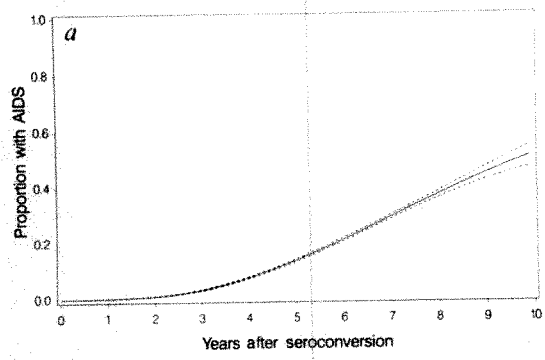


FIG. 1 Data used for estimating the distribution of times from HIV seroconversion to AIDS among gay men in San Francisco. *a*, HIV seroconversions estimated from the hepatitis B vaccine trial (solid line), the San Francisco Men's Health Study[11] (long dashes), and the San Francisco General Hospital Study[12] (short dashes). *b*, Overall estimates of HIV seroconversions (solid line) and AIDS diagnoses (dots).
METHODS. *a*, For the hepatitis B vaccine trial, a smooth curve was fitted to match estimated yearly totals[16] and scaled to total 20,260 seroconversions through September 1984. The total 20,260 is an estimated 8,757 seropositive but AIDS-free men from a random sample of part of San Francisco[11], divided by the proportion of AIDS cases from October 1984 until July 1988 who came from the sampled area (1,708 of 3,767, or 45%; this proportion was fairly stable over the period) plus 800 AIDS cases diagnosed up to September 1984. For the other cohorts, Turnbull's EM algorithm[13] was applied to interval-censored seroconversion data, with local-likelihood smoothing[10] in the *M*-step. The curves were scaled by the same factor as the vaccine trial estimate. *b*, Monthly diagnosis totals up to March 1988 are from surveillance data as of July 1988, adjusted for several sources of error. Based on data reported of November 1987 until July 1988, the proportionate increase in monthly totals arising from reports more than four months after diagnosis was modelled as a quadratic function of difference between report and diagnosis month, plus a quadratic function of calendar month of report (to allow for diminishing influence of the change in case definition[5]). This yielded corrections ranging from +14% for diagnoses in March 1988 to less than +1% for March 1987 and before. The San Francisco Department of Public Health has estimated under-reporting as ~2% before 1986 and ~5% more recently, and has also estimated that about 4% of San Francisco residents with AIDS are diagnosed elsewhere (unpublished data). Follow-up of the San Francisco General Hospital Cohort[12], in which 3 of 69 AIDS cases (4%) were diagnosed after moving from the city, suggested a correction of +4% for persons included in the seroconversion totals who were not residents when diagnosed. The seroconversion curve is a compromise among the curves from (*a*) that retains the overall shape from the hepatitis B vaccine trial and agrees closely with the other curves, while remaining smooth and totalling 20,260 seroconversions up to September 1984.

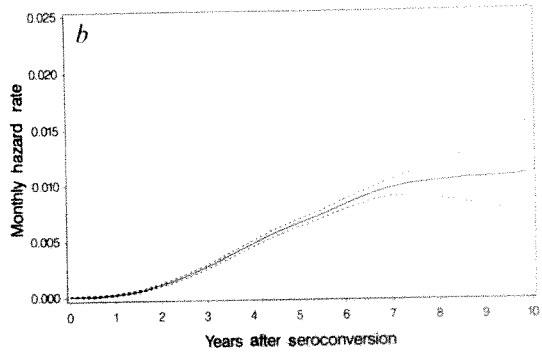

FIG. 2 Estimated distribution of time from HIV seroconversion to diagnosis of AIDS for gay men in San Francisco, 1978–1988. *a*, Cumulative distribution function (solid line), with approximate 95% confidence intervals (dashed lines). *b*, Hazard function (solid line), with approximate 95% confidence intervals (dashed lines).
METHODS. Confidence intervals were determined by a bootstrap method[14]. The estimated incubation distribution was used to generate simulated diagnosis data assuming the seroconversion pattern shown in Fig. 1*b*. Estimates were made on 200 such sets of simulated data to assess the variability resulting from random variation in how well the diagnosis pattern reflects the incubation distribution. At each month, 95% of the estimates fell between the dashed lines.

Shifting the seroconversion curve relative to the diagnosis curve would expand or contract the initial period of virtually no progression to AIDS. Applying the estimation method to a seroconversion pattern identical to the one in Fig. 1*b*, but with 10 seroconversions per month from December 1976 to May 1978, would change the estimate in Fig. 2*a* by less than 0.006 at all time points, so the possibility of an unobserved long, slow start to the epidemic does not invalidate the estimate.

Figure 3 compares fitted monthly AIDS diagnosis totals with adjusted surveillance data. The fitted curve matches the data well. The projected curves reflect the range of distributions shown in Fig. 2*b*. They are not influenced by uncertainty in the magnitude of the seroconversion curve, because any error would result in an opposite error in the incubation estimate, with no net influence on projected totals. The projections show the sharp drop in seroconversions in Fig. 1*b* manifesting itself as a much more gradual drop in AIDS diagnoses 6 to 8 years after the drop in seroconversions. For each of the three projections, the time between the peaks in seroconversions and projected diagnoses is approximately equal to the time of the peak in the density of the incubation. The gradualness of the drop in projected diagnoses is due to the large variability in incubation times[8].

Four factors may bias the estimate of Fig. 2 upwards when compared with other studies: use of the more inclusive 1987 definition of AIDS[5], use of seroconversion rather than infection times, inclusion of cases who seroconverted outside San Francisco in diagnosis totals but not in seroconversion totals, and possible downward bias in the magnitude of the seroconversion curve resulting from over representation of seropositives from the sampled area[11] among diagnosed AIDS cases. Despite these factors, Fig. 2 shows slower progression to AIDS than previous estimates[2,3] (Table 1). The large uncertainty in previous estimates, however, makes them quite compatible with Fig. 2. In addition, analyses based on blood-transfusion data deal with a very different population and only estimate the incubation period that is conditional on AIDS developing.

The incubation period of AIDS is difficult to study. Prospectively followed incident seroconverters are rare, so estimates based on them are highly uncertain[2], and data from transfusion-associated AIDS cases are inherently limited[3]. The method used here is an alternative approach. It is possible because of the availability of information on seroconversions among gay men in San Francisco and because the drop in seroconversions makes the pattern of diagnoses quite informative about the incubation. Its dependence on an accurate estimate of seroconversions is a drawback, but it does not rely on parametric assumptions, and Table 1 shows that the estimate is more precise than others, even allowing for uncertainty in estimating seroconversions.

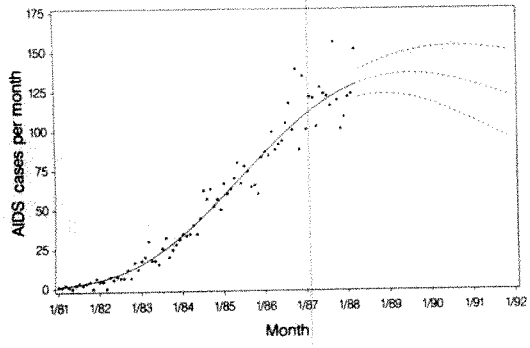

FIG. 3 Fitted (solid line) and projected (dashed lines) AIDS diagnoses among gay men in San Francisco. Projections are based on incubation distributions corresponding to the estimate in Fig. 2*b*, with the hazard remaining constant beyond year 10 (middle projection), and corresponding to the upper and lower confidence limits in Fig. 2*b*, with the hazard extrapolated linearly beyond year 10 (upper and lower projections). The adjusted surveillance totals from Fig. 1*b* (dots) are shown for comparison. Note that the vertical scale represents corrected rather than raw surveillance totals.
METHODS. Given v_j seroconversions in month j and probability p_k of developing AIDS k months after seroconversion, the expected number of diagnoses in month i is $\sum_{j=0}^{i} v_j p_{i-j}$. Fitted and projected monthly diagnosis totals were calculated by this formula with the v_js from the seroconversion curve in Fig. 1*b* (with constant extrapolation through 1991) and the p_ks from the incubation distributions described above.

ACKNOWLEDGEMENTS. We thank George Lemp and Susan Payne for AIDS surveillance data and Warren Winkelstein, Jim Wiley and Steve Shiboski for seroconversion data from the San Francisco Men's Health Study. This work was supported by funds provided by the state of California and allocated on the recomendation of the University-wide Task Force on AIDS.

The HIV-1 *rev trans*-activator acts through a structured target sequence to activate nuclear export of unspliced viral mRNA

Michael H. Malim*, Joachim Hauber*‡, Shu-Yun Le†, Jacob V. Maizel† & Bryan R. Cullen*§

* Howard Hughes Medical Institute and Department of Medicine, Duke University Medical Center, Durham, North Carolina 27710, USA
† Laboratory of Mathematical Biology, Division of Cancer Biology and Diagnosis, National Cancer Institute, National Institutes of Health, Frederick, Maryland 21701, USA

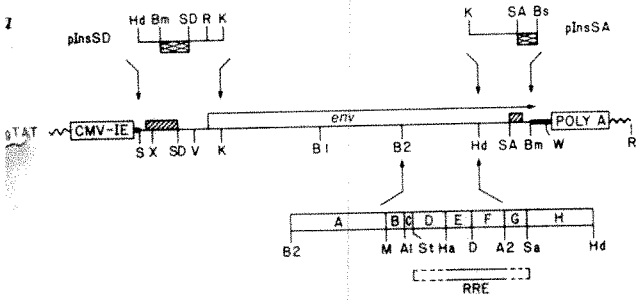
HUMAN immunodeficiency virus type 1 (HIV-1) replication requires the expression of two classes of viral mRNA. The early class of HIV-1 transcripts is fully spliced and encodes viral regulatory gene products. The functional expression of one of these nuclear regulatory proteins, termed Rev (formerly Art or Trs), induces the cytoplasmic expression of the incompletely spliced, late class of HIV-1 mRNAs that encode the viral structural proteins, including Gag and Env[1–6]. Here, we provide evidence that this induction reflects the export from the cell nucleus to the cytoplasm of a pool of unspliced viral RNA constitutively expressed in the nucleus. The hypothesis that Rev acts on RNA transport, rather than splicing, is further supported by the observation that the cytoplasmic expression of a non-spliceable HIV-1 *env* gene sequence is also subject to Rev regulation. Here we show that this Rev response requires a specific target sequence which coincides with a complex RNA secondary structure present in the *env* gene. The response to Rev is fully maintained when this sequence is relocated to other exonic or intronic locations within *env* but is ablated by inversion. These results indicate that the HIV-1 *rev* gene product induces HIV-1 structural gene expression by activating the sequence-specific nuclear export of incompletely spliced HIV-1 RNA species.

In the absence of Rev, the genomic HIV-1 *tat* gene expression vector pgTAT[6] (Fig. 1*a*) predominantly expresses a fully spliced cytoplasmic *tat* mRNA (Fig. 1*b*, lane 9) that encodes the 86-residue form of the HIV-1 Tat protein (Fig. 1*c*, lane 1). In the presence of Rev, pgTAT produces a high level of an unspliced cytoplasmic mRNA (Fig. 1*b*, lane 10), structurally equivalent to *env* mRNA[6], that encodes a truncated, 72-residue Tat protein (Fig. 1*c*, lane 2). Because it has been proposed that Rev suppresses the splicing of HIV-1 transcripts[1,7], we examined the effect of substituting heterologous splice donor (pInsSD) or splice acceptor and branch-point sequences (pInsSA) for the authentic pgTAT splice sites (Fig. 1*a*). In each case, these sequences were derived from the genomic rat preproinsulin II gene[8], which is not itself responsive to Rev (see below). Nuclease S_1 protection analysis using probes which spanned the insulin gene splice donor (Fig. 1*b*, lanes 1–4) or splice acceptor (Fig. 1*b*, lanes 5–8) reveals that the transfected pInsSA and pInsSD vectors predominantly express spliced cytoplasmic mRNA in the absence of Rev. Although these chimaeric transcripts used the predicted insulin RNA splice sites (Fig. 1*b*, lanes 1, 3, 6, 7) co-expression of *rev* nevertheless induces a high level of unspliced cytoplasmic mRNA (Fig. 1*b*, lanes 4, 8). In the case of pInsSA, the induced expression of an unspliced cytoplasmic *tat* mRNA was confirmed by immunoprecipitation analysis (Fig. 1*c*, lanes 3, 4).

The retention of full Rev responsiveness by pInsSA and pInsSD showed that the *cis*-acting Rev response element (RRE) must lie within the intronic *env* sequences of pgTAT. A series of deletion (pΔ) mutants of pgTAT (Fig. 1*a*) revealed that vectors retaining an intronic *Bgl*III (B2) to *Hin*dIII (Hd) fra ment also retained full Rev responsiveness (Table 1). All vectc lacking this sequence, however, exclusively express the 8 residue Tat encoded by the spliced *tat* mRNA, regardless of r co-expression. To localize more precisely the RRE within t B2/Hd fragment, we reinserted a series of subfragments in pΔB2/Hd to generate the pi vectors (Fig. 1*a*). The responsiv ness of these vectors to Rev (Table 1) showed that the RR must be at least 104 and possibly more than 210 nucleotid (nt) in length (Fig. 1*a*). Reinsertion of the complete B2/H fragment in the inverted orientation (piH/A) fails to restore R responsiveness (Fig. 1*b*, lane 16).

To determine whether the function of the RRE depends c location, we reinserted the B2/Hd fragment at selected sit within the Rev non-responsive pΔB2/Hd vector (Fig. 1*a*). The relocation (pλ) vectors reveal that the RRE is fully function both at other intronic sites (pλK and pλB1, Table 1) and whe inserted at an exonic *Bam*HI (Bm) site located 3′ to the *tat* gen splice acceptor (pλBm) (Fig. 1*c*, lanes 9, 10). Insertion at a *Eco*RI (R) site located immediately 3′ to the vector polyadenyl tion site (pλR) however, did not restore Rev responsiveness t pΔB2/Hd (Fig. 1*c*, lanes 11, 12). It seems therefore that th RRE can function at any location within the primary *tat* gen transcript when present in the sense orientation.

The minimal size of the RRE is relatively large, indicatin that secondary structure, in addition to primary sequence, ma be important for recognition of the RRE. Indeed, the sequenc encoding the N terminus of the HIV-1 gp41 Env protein i consistent with a high level of secondary structure[9], and in Fig 2 we present a stable predicted RNA stem-loop structure, whicl fully encompasses the minimal RRE defined by mutationa analysis. The extension of this 234-nt secondary structure beyon the minimal 210-nt RRE defined by piD/G and piB/G ma explain the incomplete Rev responsiveness of these vector (Table 1). Interestingly, the only other predicted structure o comparable significance within the HIV-1 genome coincide with the putative RNA target sequence for *trans*-activation b the viral *tat* gene product[9–11].



Although the data indicate that the *rev* gene product regulate the cytoplasmic expression of unspliced HIV-1 mRNA b directly or indirectly interacting with an RNA secondary struc ture, the observation that the RRE can function at both exonic and intronic locations argues against a direct effect on viral

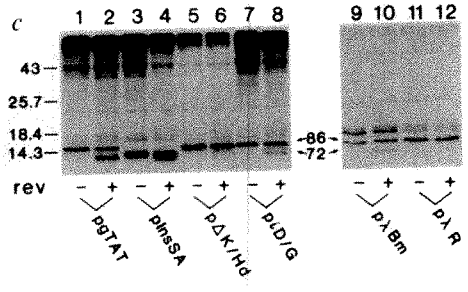

FIG. 1 Mapping of the HIV-1 Rev response element (RRE). *a*, The Rev responsive *tat* expression vector pgTAT contains the two HIV-1 *tat* gene-coding exons (hatched) separated by an *env*-gene-derived intronic element[6]. pInsSD and pInsSA were constructed by replacement of the authentic HIV-1 splice donor and splice acceptor elements with equivalent sequences from the genomic rat preproinsulin II gene expression vector pBC12MI[8]. Deletion (pΔ) mutants were constructed by excision of sequences between intronic restriction-enzyme sites. The pΔB2/Hd deletion mutant served as substrate for construction of the reinsertion (pi) and relocation (pλ) mutants. The names of the pi derivatives indicate which inclusive subfragment was reinserted. The pλ mutants were constructed by insertion of the complete A/H fragment at novel sites indicated by the vector name. The pENV160 vector lacks the HIV-1 SD sequence and instead proceeds from an *Ava*II (V) site located immediately 5′ to the *env* gene ATG[3]. pENV160 also contains 3′ *env* gene sequences which overlap with, and extend 3′ to, *rev* gene-coding sequences deleted from pgTAT. HIV-1 sequence coordinates (strain HXB-3) are relative to the start of the HIV-1 sequence at *Sal*I at position 5,367 (ref. 18). S, *Sal*I, 2; X, *Xho*II, 58; SD, splice donor, 260; V, *Ava*II, 387; *env* initiation codon, 482; K, *Kpn*I, 564; B1, *Bgl*II, 1,254; B2, *Bgl*II, 1,834; M, *Mbo*II, 1,957; Al, *Alu*I, 1,986; St, *Sty*I, 1,994; Ha, *Hae*III, 2,058; D, *Dde*I, 2,103; A2, *Alu*I, 2,162; Sa, *Sau*3AI, 2,201; Hd, *Hin*dIII, 2,354; SA, Splice acceptor, 2,590, Bm, *Bam*HI, 2,688, Bs, *Bst*EII; W, *Alw*I; R, *Eco*RI. *b*, Quantitative S_1 nuclease protection analysis of cytoplasmic RNA isolated from COS cell cultures transfected with the indicated expression vectors[6,8]. Transfections were performed in the presence of the *rev* expression vector pcREV or the negative control vector pBC12/CMV[6,8]. The end-labelled, input probes (I) were designed to permit visualization of both unspliced (U) and spliced (S) cytoplasmic mRNA species. Ins. w.t., cultures transfected with the wild-type preproinsulin II gene expression vector pBC12MI (ref. 8). *c*, Immunoprecipitation analyses of transfected COS cell cultures were performed using anti-*tat* antisera[6]. Vectors were transfected in the presence (+) or absence (−) of the *rev* expression pcREV (ref. 6). The spliced pgTAT mRNA encodes an 86-residue protein whereas the unspliced mRNA encodes a 72-residue protein[6]. pInsSA lacks the second *tat* exon (Fig. 1*a*) and encodes a spliced mRNA predicted to give an 84-residue chimaeric Tat protein.

METHODS. *b*, The strategy for the S_1 nuclease protection analyses has been described[6]. In each case, the DNA probe was end-labelled within a coding exon and extended into the flanking intron. A pBR322-derived tag permits the distinction of the input probe from the unspliced RNA signal. The probe used in Fig. 1*b*, lanes 1–4 was labelled at an insulin gene *Bam*HI (Bm) site using Klenow DNA polymerase I (Fig. 1*a*) and extends through the insulin gene splice donor (SD) at 174 nt (S) to an intronic *Eco*RI (R) site at 193 nt (U). The input probe was 386 nt in length. The probe used in Fig. 1*b*, lanes 5–8 was end-labelled at an insulin gene *Alw*I (W) site using polynucleotide kinase and extends through the insulin splice acceptor (SA) at 110 nt (S), to an intronic *Kpn*I (K) site at 378 nt (U). The input probe was 784 nt in length. The probe used in Fig. 1*b*, lanes 9–18 was end-labelled at a *tat* gene *Xho*II (X) site using Klenow DNA polymerase and extends through the *tat* gene splice donor (SD) at 202 nt (S) to an intronic *Kpn*I (K) site at 506 nt (U). The input probe was 798 nt in length.

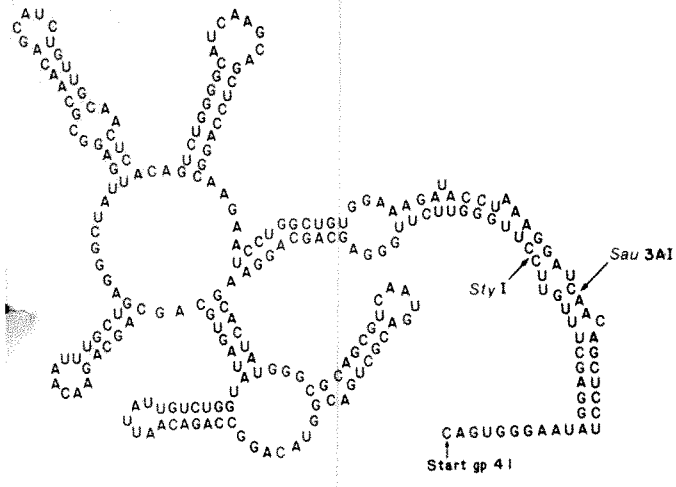

FIG. 2 Predicted secondary structure of the HIV-1 Rev response element. The mutationally defined minimal RRE extends from a 5′ *Sty*I site to a 3′ *Sau*3AI site (piD/G, Fig. 1*a*). This sequence is located immediately 3′ to the start of the gp41 *env* gene-coding region and coincides with the most highly conserved sequence domain within the *env* gene[9]. The RNA stem-loop structure presented is both extremely stable ($\Delta G = -115.1$ kcal/mol^{-1}) and highly significant (segment score in standard deviation units $= -5.29$). In a previous survey, no equivalent predicted secondary structure was observed within the HIV-1 genome[9] and the RRE is therefore likely to be unique. In fact, the RRE would be contained within all known incompletely spliced HIV-1 mRNAs, including the *gag–pol* and *env* mRNAs.

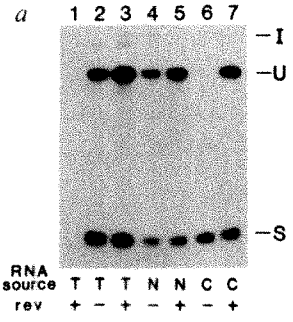
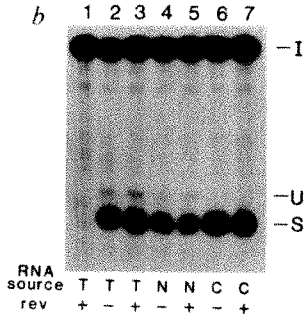
METHODS. The distribution of significant secondary structures in the HIV-1 *env* gene was calculated for window (segment) sizes ranging from 30 to 300 bases by adding two bases to the segment size from 30 to 100 bases and five bases to the segment size from 100 to 300 bases. For each segment size, the calculation was carried out by sliding one base along the *env* gene-coding sequence. The segment scores which measure the statistical significance of the optimal secondary structures were computed[9] using the Cray operating system of a CRAY X-MP/24 computer and the energy rules of Salser[19] and Cech *et al.*[20].



RNA splicing. To examine the alternative hypothesis, that Rev activates the nuclear export of unspliced HIV-1 RNAs[6], we used S_1 nuclease analysis to quantify the effect of Rev on the level of spliced and unspliced *tat* RNA within the total, nuclear and cytoplasmic fractions of cells transfected with pgTAT. As an internal control, these cultures were cotransfected with a genomic rat preproinsulin II gene expression vector[8]. This experiment again showed that unspliced *tat* mRNA contributes only a low percentage of the cytoplasmic steady-state mRNA in the absence of Rev (Fig. 3*a*, lane 6) whereas unspliced cytoplasmic *tat* mRNA predominates in *rev*-expressing cells (Fig. 3*a*, lane 7). In contrast, unspliced *tat* RNA was the predominant *tat* RNA species detected in the nucleus regardless of *rev* co-expression (Fig. 3*a*, lanes 4, 5), indicating that Rev does not significantly affect either the nuclear stability or splicing of HIV-1 transcripts. Interestingly, the level of cytoplasmic unspliced *tat* mRNA expression induced by Rev closely mirrored the high level of unspliced RNA constitutively expressed in the nucleus. This is consistent with the hypothesis that Rev functions to equilibrate the cytoplasm with a pre-existing pool of nuclear viral RNA. The Rev protein also has little effect on the level of unspliced mRNA in total cellular RNA (Fig. 3*a*, lanes 2, 3), suggesting that the nuclear pool of HIV-1 RNA in these transfected cells contributes a surprisingly high percentage of total cellular HIV-1 RNA. A parallel analysis of insulin RNA expression (Fig. 3*b*) reveals that Rev had no detectable effect on the relative expression of spliced and unspliced insulin transcripts. By contrast with the simultaneously expressed *tat* RNA, unspliced insulin RNA was observed at only a very low steady-state level and was excluded from the cytoplasm. The high steady-state level of unspliced nuclear *tat* RNA in these transfected cells indicates that this HIV-1 RNA is poorly recognized by the nuclear splicing machinery. For other retroviruses, sequences have in fact been defined which act constitutively and in *cis* to reduce splicing efficiency[12,13].



If the Rev protein acts to regulate the export from the nucleus to the cytoplasm of unspliced HIV-1 transcripts then it might also regulate the expression of genomic HIV-1 sequences which are incapable of splicing. In fact, Knight *et al.*[3] have previously shown tht an *env* gene expression vector (pENV160, see Fig. 1*a* legend) which encodes a non-spliceable *env* RNA, remains fully subject to regulation by Rev[3]. Furthermore, the Rev induction of Env protein is not accompanied by a significant increase in total cellular *env* RNA[3]. Our results (Fig. 3*a*) however, suggest, that the latter observation could have resulted from the use of unfractionated RNA in the earlier study. To clarify this, we transfected COS cells with pgTAT or with pENV160 in the presence or absence of Rev. Cytoplasmic RNA from these cultures was then subjected to northern analysis using an *env*-gene-specific probe. As previously reported[6], unspliced cytoplasmic pgTAT RNA was observed only in the presence of Rev (Fig. 3*c*, lanes 3, 4). Remarkably, the cytoplasmic expression of the *env* mRNA encoded by pENV160 was also observed to be fully dependent on *rev* co-expression (Fig. 3*c* lanes 1, 2), showing that the regulation of cytoplasmic HIV-1 RNA expression by Rev occurs independently from the regulation of HIV-1 RNA splicing.

A major question raised by this study is why the high level of unspliced *tat* mRNA detected in the nucleus of transfected cells cannot enter the cytoplasmic compartment in the absence of Rev. One possibility is that the intronic sequences present in pgTAT repress unspliced RNA transport. Indeed, Rosen *et al.*[14] have proposed the existence of four such *cis*-acting repressive (CRS) sequences within the HIV-1 *env* gene. In the absence of *rev* co-expression, the deletion mutant pΔK/Hd, which lacks all four of these proposed repressive sequences, was, however, found to express the same phenotype as the parental pgTAT vector (Fig. 1*c*, lane 5). We therefore favour the alternative hypothesis that incompletely spliced HIV-1 mRNAs are prevented from leaving the nucleus by the same processes which preclude the export from the nucleus of many unspliced or incompletely spliced gene transcripts[13,15–17]. The role of Rev would then be to permit incompletely spliced HIV-1 transcripts to interact with the nuclear RNA export machinery. It remains to be determined if the Rev *trans*-activator mediates the export of unspliced viral RNA from the nucleus by interacting directly with its RNA target sequence or whether Rev instead functions to post-translationally or transcriptionally activate cellular RNA sequence-recognition factors. □

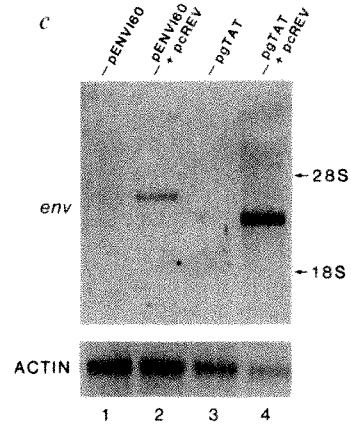

FIG. 3 The *rev* gene product activates the nuclear export of unspliced HIV-1 RNAs. *a*, S_1 nuclease analysis of spliced and unspliced *tat* gene RNA. COS cells were transfected[8] with pgTAT and the genomic rat preproinsulin II gene expression vector pBC12MI in the presence (+) or absence (–) of the *rev* gene expression vector pcREV[6]. Lane 1 contains RNA from a culture transfected with pcREV alone. Total (T) or fractionated cytoplasmic (C) and nuclear (N) RNA was prepared at 48 h after transfection as previously described (21, 22). 5 μg of RNA was used for the total and cytoplasmic S_1 analyses while 2 μg of RNA was used for the nuclear samples. The input (I) probe is identical to the *tat* probe used in Fig. 1*c*, lanes 9–18 and allows the quantitation of both spliced (S) and unspliced (U) *tat* RNAs. The relative level of unspliced *tat* RNA in each sample was determined by densitometry using an LKB soft laser scanner and is: lane 2, 0.59; lane 3, 0.71; lane 4, 0.74; lane 5, 0.81; lane 6, 0.07; lane 7, 0.77. *b*, S_1 nuclease analysis of spliced and unspliced insulin gene RNA. The analysis visualized here was performed precisely as described for Fig. 3*a*, using the same RNA samples, except that the insulin-gene-specific S_1 probe described for Fig. 1*c*, lanes 1–4 was used. This input probe (I) permits the quantitation of both spliced (S) and unspliced (U) insulin RNA. *c*, Northern analysis[23] of cytoplasmic *env* gene mRNA. COS cell cultures were transfected[6] with pgTAT or pENV160 in the presence or absence of pcREV. As the *env* gene in pENV160 is under HIV-1 LTR control, the *tat* gene expression vector pcTAT[6] was also included in each transfection. Cytoplasmic RNA was isolated[21,22] at 48 h after transfection and 5-μg aliquots used for each lane. The unspliced RNA encoded by pgTAT is predicted to be 3.0 kilobases (kb) in length, whereas the non-spliceable *env* mRNA encoded by pENV160 has a predicted size of 3.5kb[3,6]. The filter was initially probed (upper panel) with an *env* gene specific probe derived from the *Bgl*II (B2) to *Hin*dIII (Hd) fragment shown in Fig. 1*a*. Subsequently, the filter was rehybridized with an actin probe as a loading control (lower panel).

Signal transduction through the CD4 receptor involves the activation of the internal membrane tyrosine-protein kinase p56^{lck}

THE CD4 T-cell surface antigen is an integral membrane glycoprotein of relative molecular mass 55,000 which binds class II major histocompatibility complex (MHC) molecules expressed on antigen presenting cells (APCs). It is thought to stabilize physical interactions between T cells and APCs (for a review, see ref. 1). Evidence is accumulating that suggests that CD4 can transduce an independent signal during T-cell activation[2–4]. It has recently been shown that CD4 expressed on human[5,6] and murine[6] T cells is physically associated with the Src-related tyrosine protein kinase p56^{lck} (refs 7, 8). These results indicate that CD4 can function as a signal transducer and suggest that tyrosine phosphorylation events may be important in CD4-mediated signalling. Here, we present evidence that cross-linking of the CD4 receptor induces a rapid increase in the tyrosine-specific protein kinase activity of p56^{lck} and is associated with the rapid phosphorylation of one of the subunits (ζ) of the T-cell receptor complex on tyrosine residues. These data provide direct evidence for a specific CD4 signal transduction pathway that is mediated through p56^{lck} and suggest that some of the tyrosine phosphorylation events detected during antigen-mediated T-cell activation may result from signalling through this surface molecule.

To test whether binding of ligand to the extracellular domain of CD4 results in an intracellular signal involving alterations of p56^{lck}, we examined the effects of antibody-mediated cross-linking of cell-surface CD4 on the enzymatic activity of p56^{lck} (Fig. 1). Cloned CD4$^+$/CD8$^-$ murine T lymphocytes (C8, see Fig. 1 legend)[9] were incubated with anti-CD4 monoclonal antibody (mAb) GK1.5 (which reacts against the extracellular domain of CD4) and rabbit anti-rat (RAR) immunoglobulin G. The effects of this treatment on the tyrosine kinase activity of p56^{lck} were analysed by immune-complex kinase assays using Lck-specific antisera (Fig. 1*a*). CD4 cross-linking resulted in a rapid (within 30 seconds) and significant (three to fivefold) increase in the tyrosine-specific protein kinase activity of p56^{lck}, as measured by *in vitro* autophosphorylation and phosphorylation of enolase, an exogenous substrate. A parallel Lck immunoblot (Fig. 1*a*, bottom panel) showed that this change is not attributable to an increase in the abundance of p56^{lck}, suggesting that it reflects an increase in 'specific' enzymatic activity. Similar results were obtained with another CD4$^+$ murine T-cell clone (B10; ref. 6) but were not observed in the CD4$^-$ murine T-cell hybridoma 16M9 (ref. 10). The abundance of the Lck protein seemed to diminish after a few minutes of cross-linking (bottom panel, lanes 4 and 5), consistent with our previous observations[6].

The phosphorylated species migrating at about 64,000 (64K) on this gel appears to result from a non-specific immunoprecipitation (our unpublished data). Indeed, using lysis conditions that preserve the enzymatic activity of Lck as well as its interaction with CD4, another protein, p64, can be recovered by a variety of polyclonal and monoclonal antisera (including preimmune sera). Although prominent in the C8 cells, it is not detected in murine thymocytes in which a similar stimulation of p56^{lck} and enolase phosphorylation can be detected after CD4 cross-linking (manuscript in preparation). Preliminary data indicate that p64 may represent a contaminating serine kinase (unpublished data).

Further experiments (Fig. 1*b*) showed that the stimulation of Lck kinase activity depends on the physical cross-linking of CD4 as the enzymatic activity was unchanged by treatment with monovalent (antigen-binding) fragments (Fab) of mAb GK1.5 (Fig. 1*b*, lane 2). The small increase in kinase activity seen with mAb GK1.5 alone (lane 3) is probably a result of a small amount of CD4 cross-linking induced by the bivalent antibody or by aggregates of the monoclonal antibody. The specificity of the induction of Lck kinase activity by cell-surface antigen cross-linking was evaluated (Fig. 1*c*). Cross-linking of CD4 with a different anti-CD4 mAb (H129.19) (Fig. 1*c*, lane 3) also resulted in a rapid activation of p56^{lck}. Cross-linking of other surface molecules however, such as the T-cell antigen receptor (TCR) complex, which can induce T-cell activation (lane 4), Thy1.2 (lane 5) as well as cross-linking antibody directed against CD8 (using an antibody with the same isotype as mAb GK1.5) (lane 6) did not result in any alteration in enzymatic activity or abundance of the Lck protein.

Because not all p56^{lck} molecules expressed in CD4$^+$ T cells are complexed with CD4 (ref. 6), a more accurate estimate of the degree of enzymatic activation of p56^{lck} requires a specific analysis of the population of Lck molecules associated with CD4. Immune-complex kinase assays of CD4 immunoprecipitates (Fig. 2*a*) revealed that CD4 cross-linking induced a six to eightfold increase in Lck kinase activity (Fig. 2*a*, lane 2). Additional experiments established that CD4 cross-linking did not significantly alter the enzymatic activity of the non-CD4 associated Lck kinase (Fig. 2*b*, lane 2).

The only substrate of an activated tyrosine kinase detected during antigen presentation that has been defined is the ζ-subunit of the TCR complex, which is phosphorylated on tyrosine residues within minutes of antigen-mediated T-cell activation[11–13]. The data reported here raise the possibility that signalling through the CD4-Lck pathway may participate in this phosphorylation event. To determine whether CD4 cross-linking could mediate this alteration, the effect of antibody-mediated cross-linking of CD4 on the state of tyrosine phosphorylation of the ζ-subunit of the TCR complex was examined (Fig. 3). After treating CD4$^+$ murine T cells (C8) in various ways, the components of the TCR complex were immunoprecipitated with

† Present addresses: McGill Cancer Center, McGill University, 3655 Drummond Street, Montreal, Canada H3G 1Y6 (A.V.); Fox Chase Cancer Center, Philadelphia, Pennsylvania, USA (M.A.B.); Laboratory of Tumor Virus Biology, National Cancer Institute, Bethesda, Maryland, USA (E.M.H.).

specific anti-ζ-antibodies and their phosphotyrosine content analysed by antiphosphotyrosine immunoblotting. This is a sensitive and specific method for evaluating tyrosine phosphorylation changes of this TCR complex component[11-13]. The results of several experiments demonstrated that cross-linking of CD4 results in a three to fourfold increase in the phosphotyrosine content of the 21K phosphorylated form of the ζ-subunit (Fig. 3*a*, lane 3; data not shown). In these cells, the extent of the detectable increase in ζ-subunit phosphotyrosine content was similar to that induced upon activation with the combination of a stimulatory antibody to the TCR complex (mAb 145-2c11 cross-linked by Fc receptor-bearing B cells (Fc is the crystallizable fragment of an immunoglobulin) (lane 5). A detailed analysis of these modifications showed that the increase in ζ-subunit tyrosine phosphorylation occurs as soon as one minute after CD4 cross-linking, reaching a maximum after 10–15 min (Fig

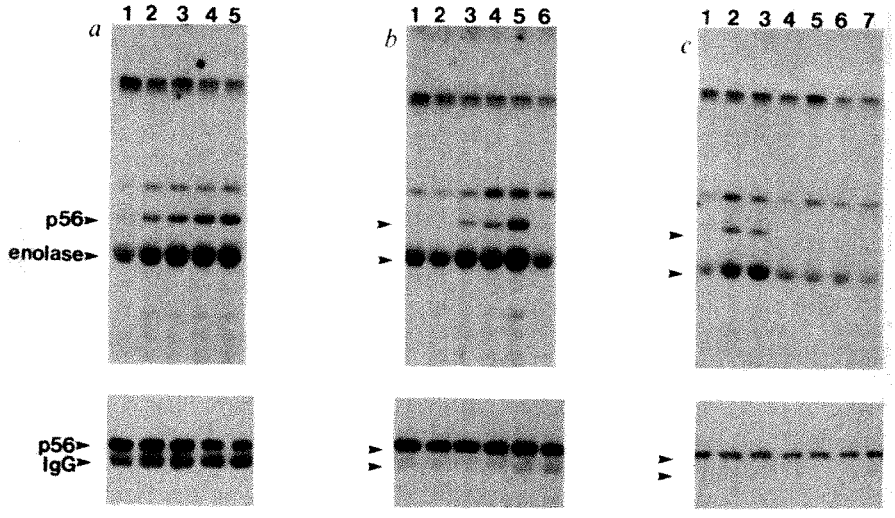

FIG. 1 Effects of surface antigen cross-linking on p56^{lck}. *a*, Time course of the effects of antibody-mediated cross-linking of CD4 on p56^{lck} from a CD4$^+$ murine T-cell clone (C8). Lane 1, untreated control; 2, 30 s; 3, 1 min; 4, 2 min and 5, 3 min. Top panel, autophosphorylation and enolase phosphorylation in *in vitro* kinase reactions. Bottom panel, Lck immunoblot assays. The positions of p56^{lck} (p56), enolase and IgG are indicated. The low level of autophosphorylation seen with Lck molecules from control cells (lane 1) is related to the presence of 10 μm non-radioactive ATP in the enolase phosphorylation reactions, a situation which favours the phosphorylation of the exogenous substrate. Lck autophosphorylation at significant levels (also observed after CD4 cross-linking) can be observed in control cells when the assay mixture contains 1 μM ATP. Similar observations have been made for the c-*src* tyrosine kinase (our unpublished data). Exposure times were: kinase, 6 h; immunoblot, 18 h. *b*, Effects of various treatments with anti-CD4 mAb (mAb GK1.5) on p56^{lck}. Cross-linking was performed for 1 min. Lane 1, untreated control; 2, Fab fragments of mAb GK1.5; 3, mAb GK1.5; 4, mAb GK1.5 with RAR IgG added to the lysate; 5, mAb GK1.5 + RAR IgG and 6, RAR IgG. Top panel, kinase reactions (autophosphorylation and enolase phosphorylation). Bottom panel: Lck immunoblot. Exposure times were as in *a*. *c*, Effects of antibody-mediated cross-linking of various cell-surface antigens on p56^{lck}. Cross-linking was performed for 1 min (similar results were obtained after cross-linking for 5 min, data not shown). Lane 1, untreated control; 2, mAb GK1.5 + RAR IgG; 3, anti-CD4 mAb H129.19 + RAR IgG; 4, anti-CD3 mAb 145-2C11 + rabbit anti-hamster (RAH) IgG; 5, anti-Thy1.2 mAb 30-H12 + RAR IgG; 6, anti-CD8 mAb 2.43 + RAR IgG; and 7, RAR IgG. Top panel, kinase reactions (autophosphorylation and enolase phosphorylation). Bottom panel, Lck immunoblot. Exposure times were kinase, 6 h; immunoblot, 14 h.

METHODS. C8 is an antigen-specific CD4$^+$ murine T-cell hybridoma derived from B6 mice[15]. Cells were grown and prepared as described elsewhere[6,15]. Resting C8 cells (10^7 cells) were incubated on ice with saturating concentrations of various mAbs for 30 min, washed in cold PBS and incubated at room temperature in serum-free DMEM with or without RAR or RAH IgG (10 μg; Organon Teknika) as second-step antibodies. After cross-linking, cells were lysed directly in DMEM by adding an equal volume of modified 2 × TNE buffer (100 mM Tris pH 8.0; 2% NP-40 and 40 mM EDTA, pH 8.0) containing 200 μM sodium orthovanadate, 100 mM sodium fluoride and the protease inhibitors leupeptin and aprotinin (each at a concentration of 20 μg ml^{-1}). Similar results were obtained if the cells were extensively washed in cold PBS before lysis (data not shown). After clarification of the detergent lysate by centrifugation (10,000*g* for 5 min at 4 °C in an Eppendorf microfuge, this centrifugation does not alter the recovery of p56^{lck}, at least within the first few minutes of cross-linking (see Fig. 1)), Lck proteins were immunoprecipitated from equivalent amounts of cellular proteins (50 μg) as described[16]. Immune-complex kinase assays were performed on washed immunoprecipitates in the presence of 10 μM ATP and rabbit muscle enolase, the model substrate[16]. The reactions were stopped by the addition of sample buffer and the products of these reactions resolved by 8% SDS-PAGE[16]. The Lck immunoblot of parallel immunoprecipitates was performed as described[8]. All monoclonal antibodies have been previously described[6] and were used as ammonium sulphate precipitation of ascites. Fab fragments of mAb GK1.5 were kindly provided by Ada Kruisbeek, NCI. We quantitated the changes described in the text by cutting bands from the gel or nitrocellulose and counting in a γ-counter or a liquid scintillation counter.

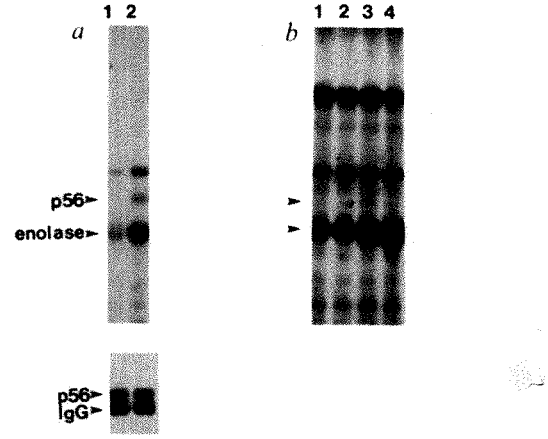

FIG. 2 Effects of CD4 cross-linking on the CD4-associated and non-CD4 associated p56^{lck}. *a*, Effect of CD4 cross-linking on activity of the CD4-associated Lck kinase. Lane 1 untreated control; and 2, mAb GK 1.5 + RAR IgG. Top panel, kinase assays; bottom panel, Lck immunoblot. The positions of p56^{lck}, enolase and IgG are indicated. Exposure times were: kinase, 6 hours; immunoblot, 18 hours (this experiment was done in parallel with that in Fig. 1*a*. *b*, Depletion experiments. Lanes 1 and 2, preclearing with anti-CD4 mAb GK 1.5; 3 and 4, preclearing with anti-Thy1.2 mAb 30-H12. Lanes 1 and 3, untreated cells; 2 and 4, after CD4 cross-linking. The restriction of Lck kinase induction to CD4-associated Lck molecules was demonstrated in a similar way by examining p56^{lck} autophosphorylation in the presence of 1 μM ATP (our unpublished data). The high level of background seen in these assays seems to be related to the extensive manipulations of the cellular lysates. Exposure time was 24 h.

METHODS. C8 cells were treated with a CD4 cross-linking antibody regimen (mAb GK 1.5 + RAR IgG) for 1 min and lysed as described in the Fig. 1 legend. CD4 was immunoprecipitated from equivalent amounts of cellular proteins (50 μg) by a combination of mAb GK 1.5, RAR IgG and *Staphylococcus aureus* protein A (this regimen was shown to recover all CD4-associated Lck, even after antibody-mediated cross-linking of surface CD4 with mAb GK 1.5 and RAR IgG, our unpublished data). For depletion experiments, the cellular lysate was first incubated at 4 °C for 2 h in the presence of the anti-CD4 mAb GK 1.5 or the anti-Thy1.2 mAb 30-H12 and then for 1 h in the presence of *Staph. aureus* protein A coupled to RAR IgG. After removing the immune complexes by centrifugation, the residual Lck proteins in the supernatant were collected by the addition of Lck-specific antisera[16]. Immune-complex kinase assays and immunoblot were performed as previously described[16].

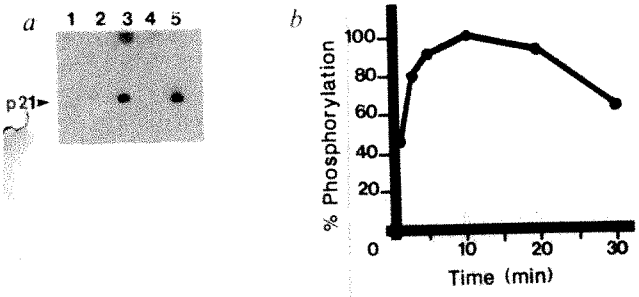

FIG. 3 Effect of CD4 cross-linking on the phosphorylation of ζ-subunit of the TCR complex. *a*, Effects of various antibody regimens. Lane 1, untreated control; 2, mAb GK1.5; 3, mAb GK1.5 and RAR IgG; 4, RAR IgG alone and 5, C8 cells incubated with the B-cell tumour LB and the anti-CD3 (epsilon) mAb 145-2C11 (ref. 6). Exposure was for 72 h. *b*, Time course. C8 cells were incubated with mAb GK1.5, washed and incubated at 37 °C as in Fig. 3*a* for the time indicated with RAR IgG. The level of ζ-chain phosphorylation was analysed with an LKB densitometer and is expressed here as a percentage of maximum-ζ-subunit phosphorylation. The results presented here are derived from the combined analysis of two separate experiments. In both cases, baseline p21(ζ) tyrosine phosphorylation was higher than that seen in the experiment represented in Fig. 3*a*. The basis for this variability is unclear. METHODS. C8 cells were subjected to CD4 cross-linking as described in Fig. 1 or cultured at a 1:1 ratio with the B-cell tumour LB 27.4 plus mAb 145-2C11 culture supernatant at 37 °C (used as T-cell activating stimuli). Cells were lysed as described and immunoprecipitated with an anti-peptide antibody recognizing the TCR-ζ-chain[13]. Electrophoresis and immunoblotting with affinity-purified anti-phosphotyrosine antibodies was performed as previously described[11–13]. Immunoprecipitation of p21 was specific for the ζ-subunit (control sera failed to precipitate this structure; data not shown). The specificity of the anti-phosphotyrosine antibodies used in these assays has previously been described[11–13].

3*b*). Similar increases in ζ-subunit tyrosine phosphorylation were also detected after CD4 cross-linking of another $CD4^+$ murine T-cell clone as well as a $CD4^+$ T-cell tumour line, whereas no effect was seen upon similar treatment of a $CD4^-$ T-cell hybridoma (L.E.S., unpublished data). It is unlikely that the tyrosine phosphorylation of the ζ-subunit reported here represents a non-specific reaction to cell-surface antigen cross-linking, as cross-linking of other surface molecules (such as LFA-1 and H-2) does not result in any significant alteration in the phosphorylation state of the ζ-subunit (L.E.S., unpublished data).

Our results indicate that the interaction of CD4 with its ligand results in a biochemical signal involving the rapid activation of $p56^{lck}$, providing direct evidence for the existence of a signalling pathway associated with CD4. These results also support the view that the CD4–Lck complex functionally mimics growth factor receptors with associated tyrosine kinase function. Although the exact mechanism of enzymatic activation of $p56^{lck}$ remains to be established, preliminary data demonstrate that CD4 cross-linking is associated with a rapid and marked increase in the phosphorylation of Tyr 394 (major site of *in vitro* phosphorylation) and Tyr 505 (major site of *in vivo* phosphorylation) of $p56^{lck}$ (our unpublished data). Interestingly, the phosphorylation state of the analogous residues of $pp60^{c\text{-}src}$ has a significant effect on its tyrosine kinase activity (for a review, see ref. 14). □

Association of dystrophin and an integral membrane glycoprotein

Kevin P. Campbell & Steven D. Kahl

Department of Physiology and Biophysics, The University of Iowa College of Medicine, Iowa City, Iowa 52242, USA

DUCHENNE muscular dystrophy (DMD) is caused by a defective gene found on the X-chromosome[1]. Dystrophin is encoded by the DMD gene and represents about 0.002% of total muscle protein[2]. Immunochemical studies have shown that dystrophin is localized to the sarcolemma in normal muscle but is absent in muscle from DMD patients[3–7]. Many features of the predicted primary structure of dystrophin are shared with membrane cytoskeletal proteins[8], but the precise function of dystrophin in muscle is unknown. Here we report the first isolation of dystrophin from digitonin-solubilized skeletal muscle membranes using wheat germ agglutinin (WGA)-Sepharose. We find that dystrophin is not a glycoprotein but binds to WGA-Sepharose because of its tight association with a WGA-binding glycoprotein. The association of dystrophin with this glycoprotein is disrupted by agents that dissociate cytoskeletal proteins from membranes. We conclude that dystrophin is linked to an integral membrane glycoprotein in the sarcolemma. Our results indicate that the function of dystrophin could be to link this glycoprotein to the underlying cytoskeleton and thus help either to preserve membrane stability or to keep the glycoprotein non-uniformly distributed in the sarcolemma.

The specific binding of dystrophin to wheat germ agglutinin (WGA)-Sepharose is shown in Fig. 1 (*a–d*). Dystrophin was solubilized from rabbit skeletal muscle membranes with 0.5 M NaCl and 1% digitonin (Fig. 1*a* and *b*, lane 1). The solubilized membranes were first passed through an antibody affinity column to remove the ryanodine receptor[9] (relative molecular mass, M_r, 450,000). This step is important because of the similar apparent mobilities on SDS-polyacrylamide gels of dystrophin and a major proteolytic fragment of the ryanodine receptor[9]. The flow-through of the ryanodine-receptor affinity column was then applied to a WGA-Sepharose 4B column. Immunoblot-analysis of solubilized membranes and of solubilized membranes that had been repeatedly passed through a WGA-Sepharose column showed that dystrophin was completely removed from solubilized membranes by WGA-Sepharose (Fig. 1*b*, lane 2). Coomassie-blue staining of both samples run on SDS-polyacrylamide gels (Fig. 1*a*) indicated that there had been no change in the protein components because most of the proteins in the rabbit skeletal muscle membrane preparation are not WGA-binding glycoproteins. The protein adsorbed to WGA-Sepharose was also analysed by SDS-PAGE and immunoblotting (Fig. 1*c* and *d*). In the absence of *N*-acetyl-D-glucosamine (NAG), the α_1 and α_2 subunits of the dihydropyridine (DHP) receptor and a protein of M_r 400K were the main proteins bound to WGA-

Sepharose (Fig. 1*c*, lane 1). The high-molecular weight protein was identified as dystrophin by immunoblotting (Fig. 1*d*, lane 1). The specificity of the absorption of dystrophin to WGA-Sepharose was tested by repeating the experiment in the presence of NAG. Only myosin ($M_r \approx 205$K) and the ($Ca^{2+}+Mg^{2+}$) ATPase ($M_r \approx 105$K) bound nonspecifically to WGA-Sepharose in the presence of NAG (Fig. 1*c*, lane 2). Our results therefore demonstrate that dystrophin specifically binds to WGA-Sepharose following solubilization in digitonin. The specific elution of dystrophin from WGA-Sepharose by NAG is shown in Fig. 1*e* and *f*; the yield of NAG-eluted material is ~5 mg from 800 mg starting membranes. The peak protein fractions that are eluted with NAG are enriched in dystrophin and the DHP receptor, as shown by Coomassie-blue staining and immunoblotting of SDS-polyacrylamide gels. Dystrophin makes up about 5% of the total NAG-eluted protein as estimated from integration of densitometer scans of the gels.

The fact that dystrophin could be isolated using WGA-Sepharose following detergent solubilization of skeletal muscle membranes indicated to us that dystrophin might be associated with the DHP receptor, or that it could be a glycoprotein. To investigate the possible association of dystrophin with the DHP receptor, we combined and fractionated NAG-eluted fractions from WGA-Sepharose using DEAE-cellulose. Elution of the DEAE-cellulose column with a linear gradient of NaCl indicated that most of the DHP receptor eluted in a broad pattern from 50–110 mM NaCl, whereas dystrophin eluted at 110–300 mM NaCl. Consequently we developed a step gradient of NaCl to separate the DHP receptor from dystrophin more effectively (Fig. 2). The first four fractions are enriched in DHP receptor and do not contain dystrophin (as determined by Coomassie blue-stained gels and immunoblots; Fig. 2*a* and *b*, lanes 2–5). The final fraction is enriched in dystrophin (corresponding to 30–40% of the protein by densitometry) and is essentially depleted of DHP receptor (Fig. 2*a* and *b*, lane 6). Proteins co-eluting with dystrophin migrated on Coomassie blue-stained gels at positions corresponding to M_rs of 325K, 250K, 225K, 172K, 162K, 143K, 57K, 47K, 39K and 31K; the mobility of dystrophin indicated that its M_r was ~360K. Immunoblotting after each step in the preparation showed that dystrophin was isolated intact and not degraded. Thus the decrease in apparent M_r of isolated dystrophin when compared with the value of 427K predicted from the complementary DNA sequence[8] may result from proteolytic processing after synthesis or simply from the difficulty in measuring high molecular weight proteins accurately on SDS gels.

To investigate whether dystrophin is a glycoprotein, we stained protein blots of DEAE-isolated dystrophin and purified DHP receptor with ^{125}I-labelled lectins. ^{125}I-labelled WGA specifically stained the α_2 subunit of the DHP receptor (Fig. 3,

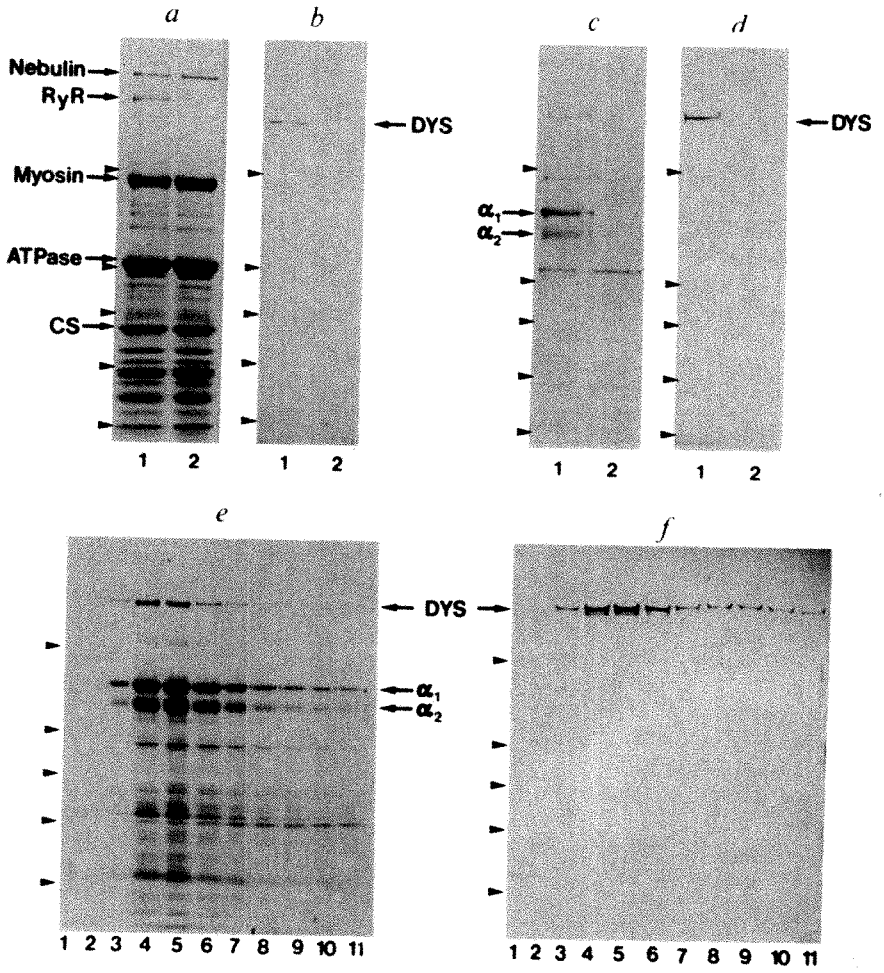

FIG. 1 Specific binding of dystrophin to WGA-Sepharose (*a–d*) and elution with *N*-acetyl-D-glucosamine (*e–f*). Coomassie blue-stained gels (*a*, *c* and *e*) and immunoblots of identical gels stained with sheep polyclonal anti-dystrophin antibodies (*b*, *d* and *f*) are shown. *a* and *b*, Lane 1, digitonin-solubilized rabbit skeletal-muscle membranes (75 μg); lane 2, column flow-through from four independent WGA-Sepharose columns (75 μg). Arrows indicate the positions of nebulin, ~700K; ryanodine receptor/Ca^{2+}-release channel, ~450K (RyR); myosin, 205K; ($Ca^{2+}+Mg^{2+}$)ATPase, 105K (ATPase); and calsequestrin, 63K (CS). *c* and *d*, WGA-Sepharose beads (50 μl) incubated with solubilized membranes in the absence (lane 1) or presence (lane 2) of *N*-acetyl-D-glucosamine. *e* and *f*, Lanes 1–11 are 100 μl aliquots of NAG-eluted WGA-Sepharose column fractions. Arrows indicate the positions of dystrophin (DYS) in panels *b*, *d*, *e* and *f* and the α_1 and α_2 subunits of the DHP receptor in panels *c* and *e*. For all panels, arrowheads indicate the positions of the molecular weight standards: from top to bottom their M_r values ($\times 10^{-3}$) are 208, 100, 68, 43 and 25.

METHODS. For *a* and *b*, rabbit skeletal muscle membranes[9] (800 mg) were solubilized with a solution of 1% digitonin and 0.5 M NaCl containing protease inhibitors at a protein concentration of 4 mg ml^{-1}, as previously described[9], then passaged through XA7-Sepharose for removal of ryanodine receptor[8] and through four different columns of WGA-Sepharose (15 ml each). For *c* and *d*, membranes (2 mg) were solubilized and passed through XA7-Sepharose as already described, then applied to 50 μl WGA-Sepharose in the absence or presence of 0.3 M NAG. After incubation the WGA-Sepharose beads were washed extensively and subjected to SDS-PAGE. For *e* and *f*, digitonin-solubilized membranes (800 mg) were applied to XA7-Sepharose and circulated overnight on 15 ml WGA-Sepharose. After extensive washing, the WGA-Sepharose column was eluted with five column volumes of 0.3 M NAG and 2.5 ml fractions were collected. Yields of 3 to 5 mg from 800 mg solubilized membranes were typical. In all experiments, WGA-Sepharose buffers contained 50 mM Tris-HCl, pH 7.4, 0.75 mM benzamidine and 0.1 mM phenylmethylsulphonyl fluoride. Samples were fractionated on 3–12% gradient SDS-polyacrylamide gels[17] and either stained with Coomassie blue or transferred to nitrocellulose paper[18] and stained with either sheep polyclonal anti-dystrophin antibodies[19] or anti-α_1 and anti-α_2 antibodies[20,21] for identification of the α_1 and α_2 subunits of the DHP receptor (not shown). Gel lanes were scanned using a Hoefer GS 300 scanning densitometer and analysed using GS-360 data analysis software. Protein concentrations were determined as previously described[22].

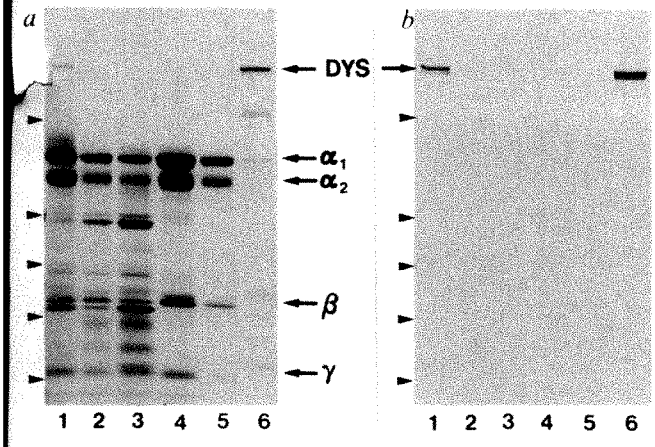

FIG. 2 Isolation of dystrophin using DEAE-cellulose. A Coomassie blue-stained gel (*a*) and an immunoblot of an identical gel stained with sheep polyclonal anti-dystrophin antibodies (*b*) are shown. Lane 1, 10 μg NAG-eluted sample (Fig. 1*e*, lane 5); lane 2, 13 μg fraction 1 from the 50 mM NaCl wash from the DEAE column; lane 3, 15 μg fraction 2 from the DEAE-column 50 mM NaCl wash; lane 4, 25 μg fraction 1 from the DEAE-column 100 mM NaCl wash; lane 5, 11 μg fraction 2 from the DEAE-column 100 mM NaCl wash; lane 6, 8 μg fraction 1 from the DEAE-column 250 mM NaCl wash. Arrows indicate the positions of dystrophin (DYS) and the α_1, α_2, β and γ subunits of the DHP receptor. Molecular weight standards (arrowheads) are the same as those used for Fig. 1.

METHODS. Eluted fractions from WGA-Sepharose (Fig. 1*e*) were applied to 2 ml packed DEAE-Cellulose equilibrated in buffer A (0.1% digitonin, 50 mM Tris-HCl, pH 7.4, 0.75 mM benzamidine and 0.1 mM phenylmethylsulphonyl fluoride). The DEAE-column was washed with 10 ml buffer A, followed by buffer A containing 50 mM NaCl (50 ml), 100 mM NaCl (200 ml), 110 mM NaCl (100 ml) and 250 mM NaCl (25 ml). Fractions (2.5 ml) were collected for all washes. Analysis of the 110 mM NaCl wash indicated a protein pattern similar to that in lanes 4 and 5, but much less intense (not shown). Washing of the DEAE-column with NaCl concentrations between 110 mM NaCl and 250 mM revealed a protein pattern similar to that in lane 6 and did not preferentially remove any protein (not shown). Approximately 300 μg isolated dystrophin (lane 6) was obtained from 700 mg solubilized membranes. SDS-PAGE, immunoblot analysis and densitometer scanning are described in the legend to Fig. 1.

lane 1) but did not stain dystrophin (Fig. 3, lane 2). Concanavalin A (con A) labelled with ^{125}I was also used to stain blots and together with results of endoglycosidase H digests confirmed that dystrophin is not a glycoprotein (data not shown). So we conclude that dystrophin must be retained by WGA-Sepharose as a result of an association with a glyco-mediator which survives solubilization of the membranes. The isolated dystrophin also binds specifically to con A-Sepharose (not shown). As glycoproteins are the only molecules that will specifically bind both to WGA-Sepharose and con A-Sepharose, the mediator must be a glycoprotein. We also show (Fig. 3) that the dystrophin preparation contains several glycoproteins ranging from 40K to 500K, but no glycolipids. Therefore the mediator of the interaction between dystrophin and the lectin columns must be a glycoprotein containing both WGA and con A binding sites. Also, as the detergent concentration necessary to solubilize dystrophin is almost identical to that required to solubilize the ryanodine and DHP receptors (both integral membrane proteins), then the mediator must also be an integral membrane glycoprotein.

To investigate this association of dystrophin with the integral membrane glycoprotein, we attempted to dissociate the dystrophin-glycoprotein complex with treatments known to disrupt the interaction between cytoskeletal proteins and membranes[10-12], and then monitored the binding of dystrophin to WGA-Sepharose. We used NAG-eluted dystrophin because we needed large amounts of protein for Coomassie-blue staining and because it contained the DHP receptor, which is a complex of several polypeptides with a major glycoprotein[13]. Figure 4 shows that NAG-eluted dystrophin rebinds completely to WGA-Sepharose after removal of NAG (lane 1). Thus, dystrophin retains its association with the WGA-binding glycoprotein after isolation and dialysis to remove NAG. When the NAG-eluted sample is treated with 1% SDS, followed by dilution to 0.1% SDS and removal of NAG by dialysis, dystrophin no longer binds to WGA-Sepharose (Fig. 4*a* and *b*, lane 2), even though the α_2 subunit of the DHP receptor (a WGA-binding glycoprotein) still binds to WGA-Sepharose (Fig. 4*c* and *d*, lane 2). Thus, SDS is able to dissociate the dystrophin–glycoprotein complex and the free dystrophin does not bind to WGA-Sepharose.

Membrane cytoskeletal protein interactions are known to be sensitive to molar concentrations of potassium iodide[10,11]. We tested the effect of KI on the interaction of dystrophin with the WGA-binding glycoprotein by treating the NAG-eluted sample with 2 M KI. After dilution of KI to 0.5 M and removal of NAG by dialysis, the sample was applied to WGA-Sepharose. In Fig. 4, lane 3 it is shown that KI dissociates the dystrophin–glycoprotein complex and that KI-treated dystrophin no longer binds to WGA-Sepharose, even though the α_2 subunit of the

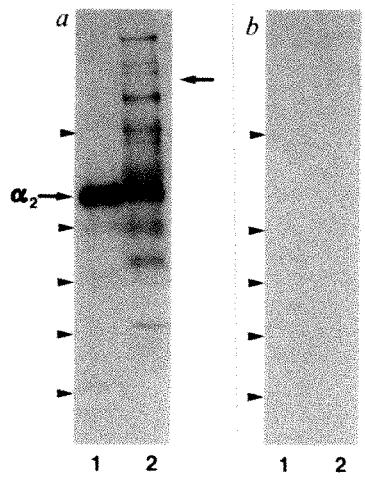

FIG. 3 Glycoprotein analysis of purified DHP receptor and isolated dystrophin using ^{125}I-labelled WGA. Autoradiographs of immunoblots incubated with ^{125}I-labelled WGA in the absence (*a*) or presence (*b*) of 0.3 M NAG are shown. Lane 1, 7 μg purified DHP receptor (Fig. 2, lane 4); lane 2, 7 μg isolated dystrophin (Fig. 2, lane 6). The position of the α_2 subunit of the DHP receptor is indicated by the arrow (α_2). The arrow on the right in panel *a* indicates the position of dystrophin determined by staining the blot with sheep polyclonal anti-dystrophin antibodies (after staining with ^{125}I-labelled WGA) and then overlaying the autoradiograph on the blot. Note that dystrophin does not stain with ^{125}I-labelled WGA. Molecular weight standards (arrowheads) are the same as those used for Fig. 1.

METHODS. DHP receptor (Fig. 2, lane 4) or isolated dystrophin (Fig. 2, lane 6) were separated on 3–12% SDS-polyacrylamide gels and transferred to nitrocellulose paper. Blots were blocked in PBS-Tween (50 mM NaH_2PO_4, 0.9% NaCl, 0.05% Tween-20) and incubated for 1 h at 25 °C with 250,000 c.p.m. ^{125}I-labelled WGA per ml PBS-Tween either with or without 0.3 M NAG. Transfers were washed extensively with PBS-Tween then with PBS, then dried and exposed to Kodak-XAR film using intensifying screens (Dupont). Exposures were for three days at 25 °C. No additional bands appeared after longer exposure. Identical results were obtained using ^{125}I-labelled con A (not shown). SDS-PAGE and immunoblot analysis are described in the legend to Fig. 1.

DHP receptor still binds to WGA-Sepharose. Similar results were obtained with con A-Sepharose (not shown). ^{125}I-labelled WGA staining of the material in the void volume from the WGA-Sepharose beads and of the NAG-eluted material (not shown) indicates that all WGA-binding glycoproteins bound to WGA-Sepharose after treatment with SDS or KI. So, dystrophin binds to WGA-Sepharose as a result of its tight association with a WGA-binding glycoprotein and this association is sensitive to SDS and KI.

Here we have reported the first isolation of dystrophin from skeletal muscle membranes: as dystrophin is present in very low concentrations in muscle, a procedure representing a 17,000-fold purification of dystrophin from whole muscle is an important advance. Previously dystrophin could only be studied indirectly, for example by using immunological probes for the protein. We have also demonstrated that dystrophin is tightly associated with an integral membrane glycoprotein and that this association i disrupted by agents that dissociate cytoskeletal proteins fron membranes. The similarities between dystrophin and th cytoskeletal proteins α-actinin and spectrin[8] further indicat that the function of dystrophin could be to link an integra membrane glycoprotein to the underlying cytoskeleton. Thi association of dystrophin with a WGA-binding glycoprotein ha been found in membranes from rabbit and rat cardiac muscl and skeletal muscle from guinea pig, dog, mouse and humar (results not shown). We conclude that the localization o dystrophin to the cytoplasmic face of the sarcolemma result from a tight association with an integral sarcolemma membran glycoprotein and we propose that this glycoprotein serves as a 'dystrophin receptor' which links dystrophin to the sarcolemma membrane. Although we have not yet identified this 'receptor', the results shown in Fig. 3 indicate that it could be one of the glycoproteins migrating with M_r 480K, 400K, 362K, 300K, 226K, 205K, 133K, 100K, 75K, 62K, 47K or 37K.

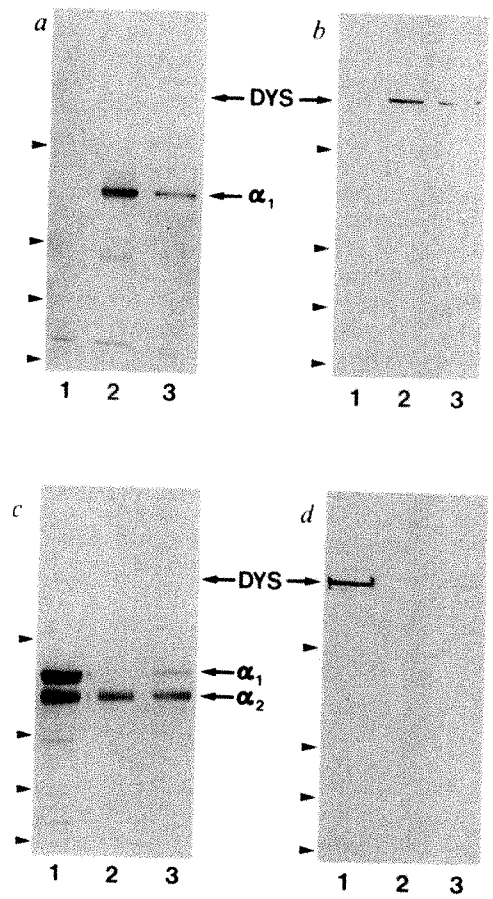

FIG. 4 Dissociation of dystrophin and membrane-associated glycoproteins using SDS and KI. Shown are Coomassie Blue-stained gels (*a* and *c*) and immunoblots of identical gels stained with sheep polyclonal anti-dystrophin antibodies (*b* and *d*). Lane 1, no treatment; lane 2, 1% SDS treatment; lane 3, 2 M KI treatment. In *a* and *b*, supernatants (100 μl) from the WGA-Sepharose beads are analysed. In *c* and *d*, NAG-eluates (100 μl) from the WGA-Sepharose beads used in *a* and *b* are analysed. The positions of dystrophin (DYS) and the α_1 and α_2 (*c* and *d* only) subunits of the DHP receptor are indicated by arrows. Molecular weight standards (arrowheads) are the same as those used for Fig. 1.
METHODS. 100 μl (20 μg) NAG-eluted sample from WGA-Sepharose (Fig. 1*e*, lane 5) was treated for 30 min at 25 °C either alone or with 1% SDS or 2 M KI. Samples were dialysed overnight in 50 mM Tris-HCl, pH 7.4, 0.5 M NaCl, 0.75 mM benzamidine and 0.1 mM phenylmethylsulphonyl fluoride-containing buffer only for the no-treatment sample, 1% SDS for the SDS-treated sample, or 0.5 M KI for the KI-treated sample, and then applied to 50 μl WGA-Sepharose prewashed either with buffer only, 0.1% SDS or 0.5 M KI. The samples were incubated for 2 h at 25 °C with agitation, then pelleted. Following extensive washing with the appropriate buffer (buffer only, 0.1% SDS or 0.5 M KI), the WGA-Sepharose beads were eluted with 0.3 M NAG. SDS-PAGE and immunoblot analysis are described in the legend to Fig. 1.

The dystrophin–glycoprotein complex may have an important structural and/or functional role in muscle: it could contribute to stabilization of the membrane or of a non-uniform distribution of a membrane glycoprotein, or it could link dystrophin to the extracellular matrix. We believe that the low concentration of dystrophin itself favours a role in maintaining the heterogeneous membrane arrangement of a scarce glycoprotein, possibly an ion channel or cell-surface receptor. The association of dystrophin with a sarcolemma glycoprotein is comparable to the association of ankyrin with red-cell or brain membranes[10–12] in that molar concentrations of KI can disrupt the complex. Recently ankyrin has been shown to be associated with the $(Na^+ + K^+)$ATPase in kidney[14] and with the Na^+ channel in the brain[15]; these associations with ankyrin were proposed to be responsible for the non-uniform distribution of these proteins in epithelial cells or neuronal cells respectively. Dystrophin may have a similar role in muscle and could be responsible for a non-uniform distribution of a membrane glycoprotein in the sarcolemma membrane.

The absence of dystrophin in DMD muscle may result in the displacement or dysfunction of the membrane glycoprotein that is normally associated with dystrophin. The lack of the dystrophin–glycoprotein complex may weaken sarcolemma membrane integrity and this may be critical for fast muscle fibres, which appear to be the first site of degeneration[16]. It remains to identify the 'dystrophin receptor' in the sarcolemma membrane and to determine the role of dystrophin in the function of the membrane glycoprotein. □

A *Drosophila* tissue polarity locus encodes a protein containing seven potential transmembrane domains

Charles R. Vinson*, Sharon Conover & Paul N. Adler

Biology Department, Molecular Biology Institute, and Cancer Center, Gilmer Hall, University of Virgina, Charlottesville, Virginia 22901, USA
* Present address: Carnegie Institution of Washington, 115 West University Parkway, Baltimore, Maryland, USA

THE function of the *frizzled* (*fz*) locus in *Drosophilia melanogaster* is required to coordinate the cytoskeletons of epidermal cells to produce a parallel array of cuticular hairs and bristles (for example on the wild-type wing all hairs point towards the distal tip)[1,2]. In *fz* mutants it is not the structure of individual hairs and bristles that is altered, but their orientation with respect to their neighbours and the organism as a whole. Mitotic clone analysis[3] indicates that *fz* has two functions in the developing wing. It is required for the proximal-distal transmission of an intercellular polarity signal, a process that is expected to be at least partly extracellular. It is also required for cells to respond to the polarity signal, which is expected to be a cytoplasmic function. The *fz* locus could encode either one bifunctional or two single-function proteins. We report here that, in pupae, *fz* produces a messenger RNA that encodes a protein with seven putative transmembrane domains. Thus, the Fz protein should contain both extracellular and cytoplasmic domains, which could function in the transmission and interpretation of polarity information, respectively. This is the first reported sequence for the protein product of a tissue polarity gene.

The *fz* locus was cloned by transposon tagging[4,5] and *fz* complementary DNA clones isolated[6] (the detailed molecular analysis of the *fz* locus will be presented elsewhere). A single 4 kilobase (kb) hybridization band is seen when northern blots of poly(A)$^+$ pupal RNA are probed with cDNA sequences, suggesting that *fz* encodes a single bifunctional protein.

The 2,466-base pair (bp) sequence of a *fz* cDNA clone is shown in Fig. 1. There is a single complete long open reading frame of 581 amino acids. The Fz protein sequence has several interesting features. Most notably, hydrophobicity analysis[7,8] reveals seven strongly hydrophobic stretches (regions 1 to 7 in Fig. 2), which are typical of transmembrane domains of integral membrane proteins. As *fz* is required for the transmission of an intercellular polarity signal, we suggest that the protein product is located in the plasma membrane of epidermal cells. The N terminus of the Fz protein probably encodes a signal sequence for membrane transport, as typical n (positively charged N-terminal, Arg 3), h (hydrophobic, Ile 5–Ile 13), and c (polar C-terminal, Gln 14–Asp 25) regions are present[9]. In addition, a potential cleavage site for the signal peptidase is present at Ala 26. This suggests that the terminus of Fz is extracellular. If each of the seven hydrophobic regions (Fig. 2) are trans-

FIG. 1 The sequence of the insert of the cDNA clone CVC22. The 2,466-bp sequence CVC22 is shown with the deduced translation product from the single long open reading frame. This cDNA clone was isolated from a library constructed by L. Kauvar[18] from poly(A)$^+$ RNA isolated from early pupae. The open reading frame has typical *Drosophila* codon usage, and the CAAA sequence preceding the ATG translation start sequence fits the *Drosophila* consensus sequence of C/AAAA/C[19]. There are termination codons in all three reading frames upstream from this start site. There is no typical poly(A) addition sequence (AATAAA) upstream of the 3′ oligo(A) sequence, and the 3′ untranslated region is relatively short, ~120 nucleotides. A more extensive cDNA clone analysis W. J. Park and P.N.A., unpublished results) has shown that CVC22 is missing over 1.3 kb of sequence of its 3′ end. The analysis of additional cDNA clones from other libraries has not revealed any additional *fz* mRNA species in larvae or pupae. The putative transmembrane domains are underlined and labelled. Sites of potential *N*-linked glycosylation are marked by an asterisk. The cDNA sequences were subcloned into the Bluescript vector (Stratagene), a set of processive deletions made, and single-stranded templates sequenced using the Sequenase reagents (US Biochemicals). The entire sequence was determined in both directions.

membrane domains *in vivo*, then the Fz protein would contain four extracellular and four intracellular domains. The largest of these would be the extracellular N-terminal domain. The sequences of three transmembrane domains (M4, M5 and M6, Fig. 1) are interesting because they contain a proline. Prolines are found in many transmembrane domains of membrane transport proteins[10] and cell-surface receptors[11], whereas they are excluded from the transmembrane domains of other classes of membrane proteins, such as viral envelope proteins[10]. There is no striking sequence similarity between Fz and any of the sequences in the NBRF and translated GENBANK data bases[12].

The function of the *fz* locus is required for the transmission of polarity information. The predicted structure of the Fz protein suggests is could do this either by transporting a polari morphogen[13] across cell membranes, or by mediating dire cell-cell interactions[14,15]. The *fz* locus function is also require for cells to be able to respond to polarity information. Th presence of seven putative transmembrane domains in the F protein is notable as seven transmembrane domains are foun in the large family of G-protein-coupled membrane recep tors[11,16,17]. Although Fz does not have substantial sequenc similarity to the products of any members of this gene family it does seem to have topological similarity. It is therefore possibl that Fz functions by a G protein to transduce polarit information to the cytoskeleton during hair and bristl development.

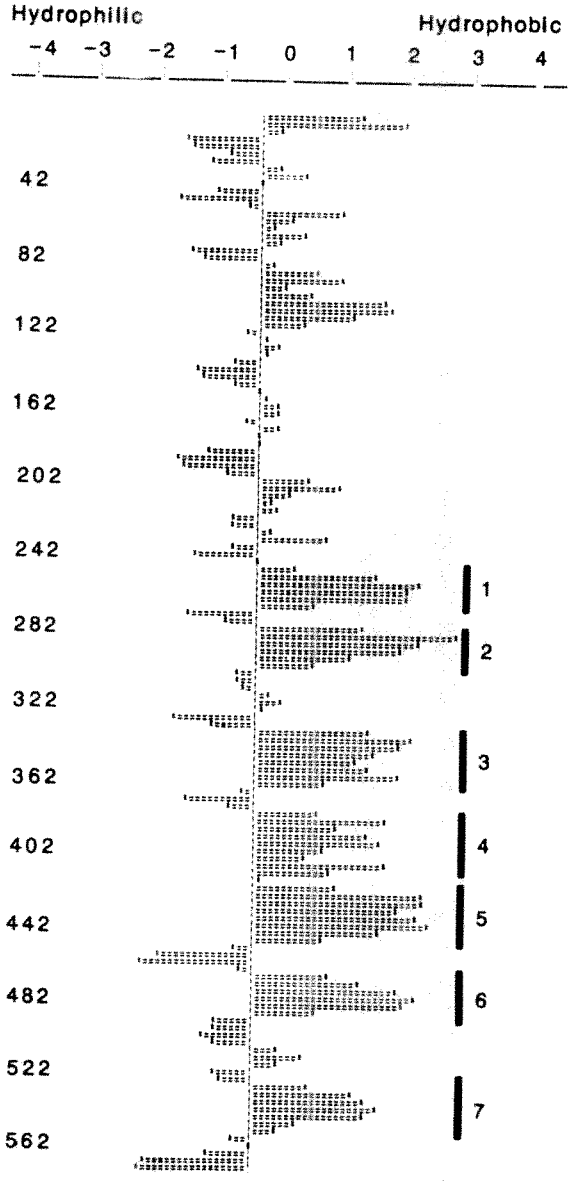

FIG. 2 Hydropathy plot of the Fz protein. Hydropathy of the deduced protein sequence was analysed as described in ref. 7, using windows of 9 and 19 residues, and by the GES approach[8] with a window of 20 amino acids. The plot shown was generated by the approach of Kyte and Doolittle[7] using a window of 9. The data is compressed four times, thus each point is an average for four residues. All analyses gave reasonably similar results except that the relatively hydrophobic region centred around amino acid 110 shown here came out much less hydrophobic when the GES approach was used (and somewhat less hydrophobic when the Kyte and Doolittle approach was used with a window of 19), so this region probably does not represent a transmembrane domain. The location of the seven proposed transmembrane domains is shown (1 to 7).

A *Pseudomonas* thrives in high concentrations of toluene

Akira Inoue & Koki Horikoshi*

Laboratory of Microbial Metabolism, The Superbugs Project, Research Development Corporation of Japan, 2-28-8 Honkomagome, Bunkyo-ku, Tokyo 113, Japan

TOLUENE, like many organic sovents, is highly biotoxic and kills most microorganisms at low concentrations (0.1% v/v). It is often used therefore to sterilize microbial cultures and lyse bacterial cells in the assay of bacterial enzymes[1–3]. The physiological basis of such solvent toxicity, however, remains poorly characterized. Although some microorganisms, including *Pseudomonas*[4–6], *Achromobacter*[4] and *Nocardia*[7], can assimilate toluene, their tolerance for the solvent is less than 0.3% (v/v). We report here the discovery of a variant strain of *Pseudomonas putida* which is capable of growing in media culture containing more than 50% (v/v) toluene or high concentrations of cyclohexane, xylene, styrene and heptanol. By studying this unusually tolerant strain we show that the relative toxicities of different solvents are determined by their polarities.

We isolated the toluene-resistant bacterium from Japanese soil by selecting for microbial growth in a nutrient medium containing toluene. To isolate toluene-resistant microorganisms, a small amount of soil was suspended in sterile water and 0.2 ml of this suspension transferred to test tubes containing 5 ml of a nutrient medium comprising 0.1% glucose, 0.25% yeast extract (Difco Lab.) and 0.5% polypeptone (Difco Lab.), at pH 7.0. Toluene was then added to a final concentration of 30% (v/v), the test tubes were plugged with butyl-rubber, and the cultures incubated at 37°C for one week in a test-tube shaker. From the

* Present address: Department of Bio-Engineering, Tokyo Institute of Technology, O-okayama, Meguro-ku, Tokyo 152, Japan.

750 soil samples collected, one strain, IH-2000 (FERM BP-1751) which grew well in the toluene medium, was isolated from soil in Kyushu, southern Japan. Subsequent characterization of this bacterium showed that it is aerobic, motile, gram-negative and rod-shaped (0.8–1.0 by 2.0–4.0 μm), and has four polar flagella. The G and C content of its DNA is 62.5% and it reacts positively in catalase and oxidase tests, as well as being OF test-oxidative. From these and other morphological and biochemical characteristics of the strain, determined in accordance with standard methods[8], the isolate IH-2000 was identified as a strain of *P. putida*, which differs from other strains only by its resistance to toluene. Unlike *P. putida* strains which carry the TOL plasmid, strain IH-2000 is however, unable to utilize toluene as a nutrient.

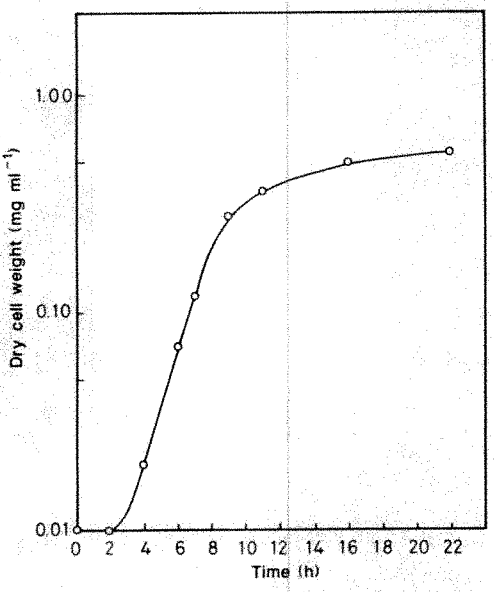

FIG. 1 Growth curve of strain IH-2000 in the LB medium containing 30% toluene.

By contrast with other strains including *P. putida* IFO 3738 and *P. putida* IAM 1506, which when tested for solvent tolerance failed to grow in a culture medium containing 30% toluene, strain IH-2000 grew in emulsions containing more than 50% toluene and was actively motile in these culture media. The doubling time for growth in a Luria–Bertani (LB) medium was 1.22 h and 0.77 h in the presence of 30% toluene and in the absence of the solvent, respectively (Fig. 1). After 24 h, the LB–toluene medium contained 2×10^9 cells per ml. Furthermore, single cells of this strain formed colonies on a solid nutrient medium, overlaid with toluene, which remained viable for several weeks. This indicates that solvent tolerance is a stable phenotypic property of strain IH-2000.

To investigate the solvent tolerance genetically, we isolated solvent-sensitive mutants using the replica-plating method in conjunction with penicillin selection after treatment with 1-methyl-3-nitro-1-nitrosoguanidine (NTG). First, we made Leu and Trp auxotrophs from the IH-2000 strain by two NTG treatments. We then isolated three toluene-sensitive mutants from 3,000 colonies of mutant cells. Remarkably, one of these (IH-2124T) was sensitive to toluene but resistant to xylene and cyclohexane. We subsequently isolated one xylene-sensitive mutant (IH-2124TX) from 2,000 colonies of mutant cells derived from the toluene-sensitive strain. This strain was consequently sensitive to both toluene and xylene, but resistant to cyclohexane. From the IH-2124TX strain, a cyclohexane-sensitive mutant (IH-2124TXC) which remained hexane-resistant was isolated. Each of these mutants retained the Leu and Trp auxotrophic markers. The toluene-sensitive mutant, for which the frequency of back mutation was less than 10^{-9}, was very stable. The xylene-sensitive and cyclohexane-sensitive mutants exhibited frequencies of back mutation of 10^{-7} to 10^{-8} respectively. In addition to toluene, these strains tolerated other toxic solvents including aliphatic hydrocarbons, alicyclic hydrocar-

bons, aromatic hydrocarbons, alcohols and ethers. The solvent tolerance properties of the IH-2000 and its mutants are summarized in Table 1.

Figure 2 shows the correlation between the growth of strain IH-2000 and the polarity of the solvent. The parameter log *P*, where *P* is the partition coefficient of a given solvent in an equimolar mixture of octanol and water, is used as a quantitative index of solvent polarity. It is evident that although the strain grows in solvents whose log *P* values are greater than or equal to 2.4, such as heptanol (log $P = 2.4$), toluene (log $P = 2.8$) and n-octane (log $P = 4.9$), it does not grow in fluorobenzene, benzene and butanol whose log *P* values are 2.3, 2.1 and 0.8, respectively. It seems therefore that a critical point is reached beween log *P* values of 2.4 and 2.3, at which the solvent is polar enough to prevent growth. The concept of such a tolerance limit can be extended to predict the growth of other microbial species in solvent-saturated environments (see Table 1).

These observations indicate that the nature of the interaction between the solvent and the cell surface that limits growth is at least partly determined by solvent polarity. Moreover, the unusually high tolerance of strain IH-2000 for toluene and other solvents probably reflects the presence of cell surface components that are unique to the strain. With a view to characterizing these components and their genetic basis, we have already isolated, from the chromosomal DNA of strain IH-2000, a 10-kilobase fragment (data not shown) which contains genes for solvent tolerance. □

Phase variation in *Bordetella pertussis* by frameshift mutation in a gene for a novel two-component system

Scott Stibitz*, Wendy Aaronson*, Denise Monack† & Stanley Falkow†

* Center for Biologics Evaluation and Research, Food and Drug Administration, 8800 Rockville Pike, Bethesda, Maryland 20892, USA
† Department of Microbiology and Immunology, Stanford University, Stanford, California 94305, USA

***BORDETELLA pertussis*, the aetiological agent of whooping cough, coordinately regulates the expression of many virulence-associated determinants, including filamentous haemagglutinin, pertussis toxin, adenylyl cyclase toxin, dermonecrotic toxin and haemolysin. The coordinate regulation is apparent in the repression of synthesis of these determinants in response to environmental stimuli[1,2]; a phenomenon known as antigenic or phenotypic modulation. *B. pertussis* also varies between metastable genetic states, or phases. There is a virulent phase in which virulence-associated determinants are synthesized, and an avirulent phase in which they are not[3]. Previous studies[4,5] have shown that a genetic locus, *vir*, is required for expression from many virulence-associated loci, and that replacing the cloned *vir* locus in *trans* can restore the virulent phase phenotype to spontaneously occurring avirulent phase strains. Here, we show that phase variation in one series of strains is due to a frameshift mutation within an open reading frame that is predicted to code for a Vir protein product. The deduced protein sequence is similar to both components of the 'two-component' regulatory systems which control gene expression in response to environmental stimuli in a range of bacterial species.**

Tohama I is a virulent phase *B. pertussis* strain isolated from a pertussis patient in Japan[6]. The ancestry of all *B. pertussis* strains used in this study can be traced to this strain, and their

elationship is shown in Fig. 1. We have shown previously that 14.7-kilobase (kb) *Bam*HI fragment from BP338 containing he *vir* locus can restore the virulent phase phenotype to BP369-3 vhen returned in *trans*[5]. We repeated this experiment for the ɔther strains shown in Fig. 1 by cloning the homologous *Bam*HI ragment from BP326, BP368-3, BP369-3, BP370-1 and BP371-1 nto the broad host-range cloning vector pRK290 (ref. 7) and ransferring the resultant plasmids by conjugation to the ıvirulent phase strains BP326, BP369-3 and BP371-1. When the ɔir locus transferred had been cloned from one of the virulent ɔhase strains BP338, BP368-3 or BP370-1, the resulting excon- ugant colonies had a typically Vir^+ phenotype, being compact hemispherical (domed), and with a clear zone of haemolysis on Bordet–Gengou agar. When the *vir* locus was from BP326, BP369-3 or BP371-1, a Vir^- phenotype was obtained (flat and nonhaemolytic).

We examined the virulent phase (*vir*$^+$ form) and the avirulent phase (*vir*$^-$ form) of the cloned *vir* locus to see if there was a physical difference, such as an inversion or deletion that could explain the genetic differences. None were apparent after restriction enzyme analysis with *Eco*RI, *Sal*I or *Pst*I, or electron microscopic heteroduplex analysis (data not shown). We therefore designed an experiment to map the location of this difference by genetic means.

We constructed a set of deletions of the *vir* locus of BP338 *in vitro* (Fig. 2), and tested them for their ability to restore the *Vir*$^+$ phenotype in two different ways. For the test in *trans*, each derivative was cloned into pRK290 and returned by conjugation to a virulent phase *B. pertussis* strains. None of the four deletions tested contained an intact *vir* locus, as they were all negative in *trans* (data not shown). To test for restoration of the *Vir*$^+$ phenotype by recombination, the same deletion fragments were cloned into pSS853, a vector that confers kanamycin resistance. This vector can be transferred by conjugation into *B. pertussis* but cannot replicate there autonomously. Thus, exconjugants can be selected in which the plasmid has been integrated into the *B. pertussis* chromosome by selection for kanamycin resistance. This integration will probably occur by homologous recombination within an area of homology; in the case of the *vir* deletion derivatives, within the cloned *vir* DNA. If the deletion derivative being tested contains the site of the difference between the *vir*$^+$ and *vir*$^-$ forms then some of the exconjugants arising from a mating will be Vir^+ due to crossover between this site and the end-point of the deletion. If the deletion derivative does not contain the site of this difference, only Vir^- colonies will be obtained. As shown in Fig. 2, two of the deletions could restore the virulent phase phenotype by recombination. These data indicate that the difference between the *vir*$^+$ and *vir*$^-$ forms of the *vir* locus lies within the deletion interval defined by deletions 856 and 858, within the *Sal*I fragment D. The same results were obtained regardless of which avirulent phase strain was the recipient; hence, the *vir*$^-$ lesion is within this deletion

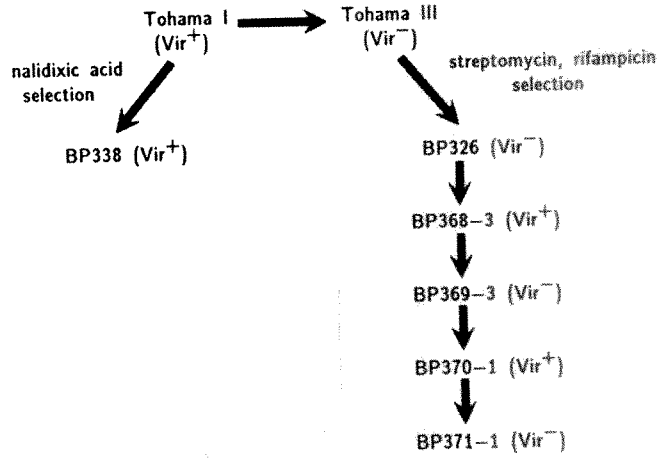

FIG. 1 Pedigree of *B. pertussis* strains used in this study. Tohama I was isolated from a patient in Japan[6]. BP338 is a spontaneous nalidixic acid-resistant derivative of Tohama I[1,2]. Tohama III was isolated as a spontaneous variant of Tohama I after passage *in vitro* (Y. Sato, personal communication). BP326 is a spontaneous rifampicin and streptomycin-resistant derivative of Tohama III[1,2]. BP368-3 and BP370-1 were isolated as spontaneously occurring haemolytic variants of BP326 and BP369-3, respectively[4,8]. BP369-3 and BP371-1 were isolated from BP368-3 and BP370-1, respectively, by erythromycin selection for avirulent phase derivatives[4,5].

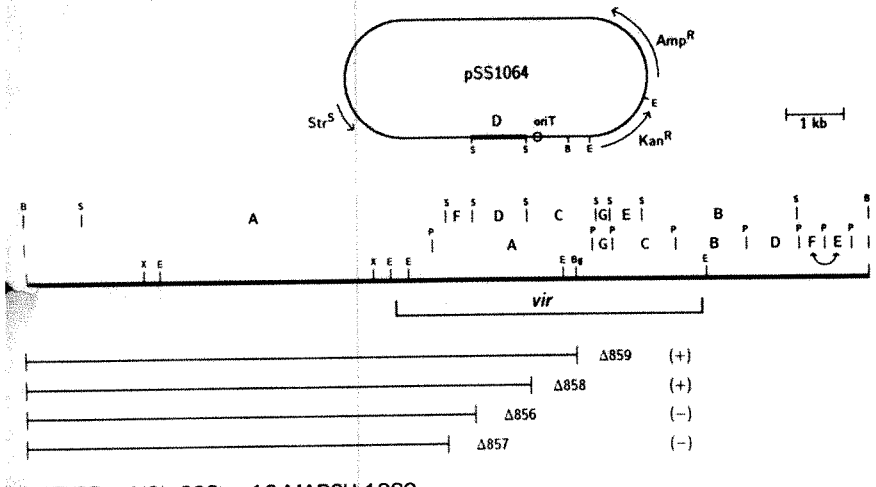
interval in BP326, BP369-3 and BP371-1. To establish further that the difference between the *vir*$^+$ and *vir*$^-$ forms was contained within *Sal*I restriction fragment D, this fragment was used in a double crossover recombination experiment to rescue the Vir^- phenotype. It was cloned into pRTP1, a vector designed for the replacement of chromosomal sequences with cloned and/or modified ones[8] (Fig. 2). The resulting plasmid was modified further by the addition of a gene encoding kanamycin resistance to improve the selection for exconjugants. This plasmid, pSS1064, was transferred by conjugation to BP326, BP369-3 and BP371-1. The resulting kanamycin-resistant *B. pertussis* derivatives were of the avirulent phase, as judged by colony morphology and we assumed that the plasmid had integrated via a single crossover within the cloned *Sal*I fragment. In a sampling of these *vir*$^-$ exconjugants, we selected for a second crossover event by selecting for loss of the integrated plasmid by virtue of the streptomycin sensitivity phenotype it conferred. The colonies arising after streaking on streptomycin-containing media were both Vir^+ and Vir^-, as expected. The two types of colonies were obtained in approximately equal numbers. The frequency at which *vir*$^+$ derivatives arise by this method is at least 1,000-fold higher than the frequency at which they arise spontaneously. This experiment confirmed that the site of the functional difference in the two forms of the *vir* locus is within the *Sal*I fragment D.



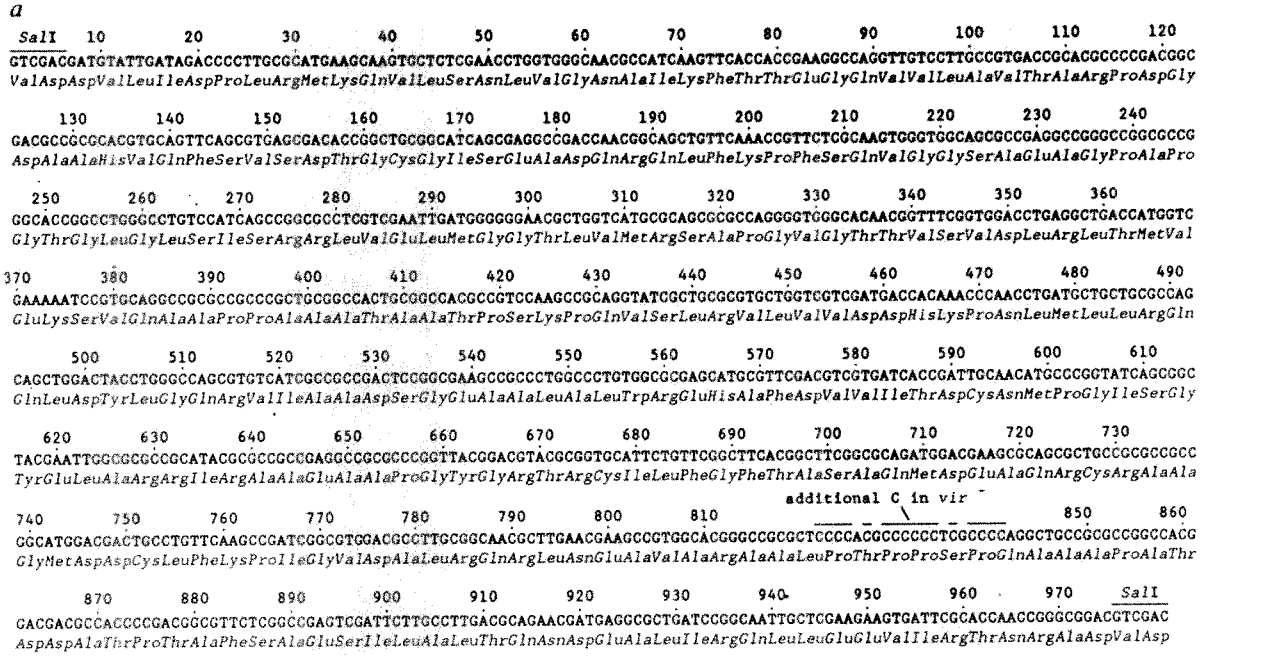


FIG. 2 Restriction map of the *vir* locus of *B. pertussis*. Restriction enzyme abbreviations: B, *Bam*HI; E, *Eco*RI; P, *Pst*I; S, *Sal*I; X, *Xho*I. The bracket below the map shows the extent of the *vir* locus determined by insertion and deletion mapping in *B. pertussis* (manuscript in preparation). DNA sequences remaining in the deletion derivatives are shown below the map: '+' indicates that a given deletion was capable of restoring, by recombination, the virulent phase phenotype (domed and haemolytic) when cloned into pSS853 and transferred from *Escherichia coli* strain SM10 (ref. 13) to BP326 by conjugation. pSS853 is a derivative of pBR322 containing *oriT* from RK2, and a kanamycin-resistance gene. Shown above the map is the structure of pSS1064; derived by cloning the *Sal*I fragment D of *vir* from BP338 into the vector pRTP1 (ref. 8) and subsequent addition of a kanamycin-resistance cassette.

To define the precise difference between the *vir*$^+$ and the *vir*$^-$ allelic forms, the DNA sequence of the *Sal*I fragment D was determined (Fig. 3*a*). The only difference observed between the two *vir*$^+$ forms of BP338 and BP368-3 and the *vir*$^-$ form of BP326 was the presence of an extra C residue in a run of six C residues. The sequence of this C-rich region from BP369-3, BP370-1 and BP371-1 was also determined. In these strains as well, the *vir*$^+$ form contained six C's and the *vir*$^-$ forms contained seven C's. The difference between the two forms of the *vir* locus is therefore a frameshift mutation. This mutation occurs in a 'classical' context for frameshift mutations: runs of a particular nucleotide, especially G or C (ref. 9).

Figure 3*b* shows that, if the open reading frame is read from right to left with reference to Fig. 2, there is significant sequence similarity between the beginning of the predicted Vir protein sequence and the C-terminal sequences of members of a class of bacterial regulatory proteins that constitute one component of the 'two-component' systems which regulate gene expression in response to environmental stimuli in a wide variety of bacteria[10]. This 'sensor' component is often localized to the bacterial inner membrane and is involved in sensing the environment. The other 'regulator' component is thought to interact with this 'sensor' and to exert its effects in response to signals received from it. Recently, this interaction has been shown to involve phosphorylation of the regulator component by the sensor component in some of these systems[11]. Interestingly, the second part of the Vir sequence has significant similarity with that of the 'regulator' component. These data suggest that one of the genes within the *vir* locus encodes a protein that can respond to environmental signals with changes in the expression of virulence-associated factors. What is novel about this putative *vir* gene product is that both components of a 'two-component' system are apparently incorporated into a single protein. This combination of sensor and regulator modules within a single protein has recently been recognized in other bacterial signalling proteins[25].

If the difference between the *vir*$^+$ and *vir*$^-$ forms is indeed a frameshift mutation, a frameshift mutagen would be expected to increase the rate of conversion between these two forms. To test this hypothesis, BP326 was grown for several generations in Stainer–Scholte broth containing varying amounts of the frameshift mutagen ICR-191. The proportion of Vir$^+$ colonies obtained when plated onto solid media was influenced in a dose-dependent way by the concentration of ICR-191 (Fig. 4).

a

b

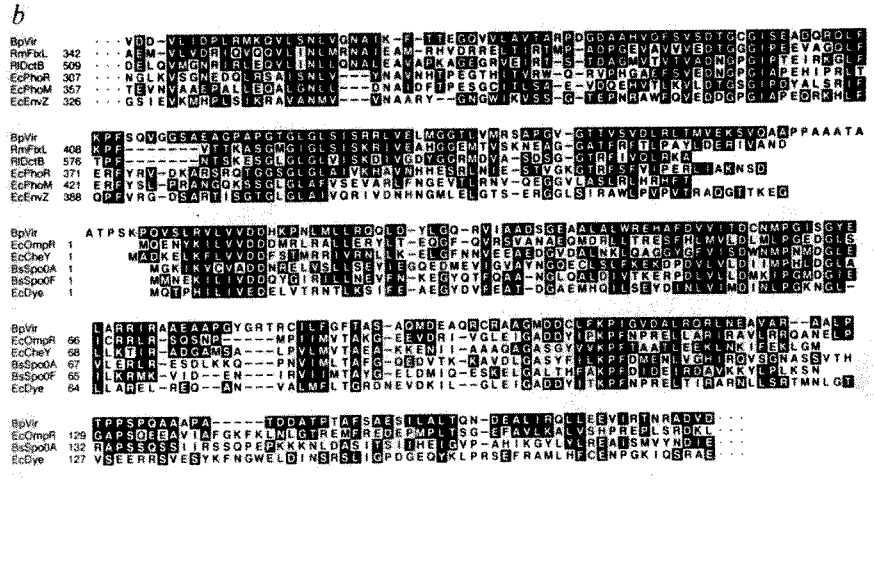

FIG. 3 *a*, DNA sequence of the *Sal*I restriction fragment D from BP338 and BP368-3. The sequence is read from right to left with respect to Fig. 2, and was determined by the dideoxy chain-termination method using M13 phage templates and synthetic primers to the *vir* sequence. The sequence of both strands was determined. The C-rich region is overlined. *b*, Sequence comparison of the predicted portion of a *vir* product and some examples of members of 'two-component' regulatory systems. 'Sensor' sequences are FixL from *Rhizobium meliloti*[14], DctB from *Rhizobium leguminosarum*[15], PhoR from *E. coli*[16], PhoM from *E. coli*[17], and EnvZ from *E. coli*[18]. 'Regulator' sequences are OmpR from *E. coli*[18], CheY from *E. coli*[19], Spo0A from *Bacillus subtilis*[20], Spo0F from *B. Subtilis*[21] and Dye from *E. coli*[22]. Alignments were made using the FASTP algorithm[23]. Boxed residues indicate a similar amino-acid residue between Vir and the other sequences. Similar residues are those belonging to the groups: PAGST; HKR; QNED; ILVMFYW (single-letter code). Numbers indicate amino-acid residue number within a protein. Dots indicate that the protein sequence extends beyond that shown.

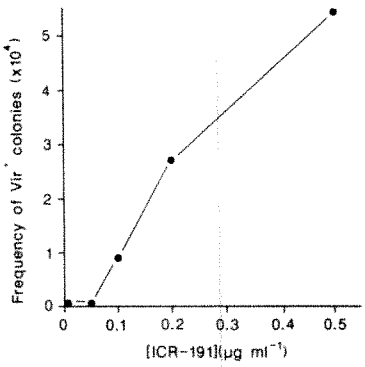

FIG. 4 Reversion of the avirulent phase phenotype of BP326 by treatment with the frameshift mutagen ICR-191. The procedure was essentially as previously described[24]. A culture of BP326 grown in Stainer–Scholte broth was diluted by 10^{-4}. Aliquots (0.1 ml) were added to 3 ml of the same medium containing different concentrations of ICR-191 and incubated in the dark at 35 °C, with shaking, for 5–7 days. Cultures showing visible turbidity were diluted and plated on Bordet–Gengou agar to obtain 10^3–10^4 colonies per plate. After growth for 5 days, plates were examined for haemolytic colonies.

Similar results were obtained for BP369-3 and BP371-1. These data support the hypothesis that phase variation in this series of strains occurs via a frameshift mutation in a *vir* gene.

An important question arising from our results is whether this frameshift mutation represents a true 'programmed' genetic event reflecting an evolved site-specific mechanism. The exact nucleotide sequence requirements at the site of the mutation are not yet known. It is worth noting that in *B. pertussis*, an organism with a relatively high (G+C) content, a run of six G or six C residues is, as expected, not uncommon. The sequence around the site of the frameshift mutation is striking however, in its abundance of GC pairs and in its near symmetry. It will be interesting to test whether the groups of C residues outside the core six C residues affect the frequency of phase variation. This frequency varies with the strain used and is relatively high in the strains which have descended from Tohama III (about 10^{-3} for the vir^+ to vir^- transition[4]). In contrast, the frequency at which BP338 undergoes this transition is about 10^{-6}. In an attempt to determine the basis for this difference, we are examining the reversion of other frameshift mutations in these two backgrounds to determine whether this is a general effect on frameshift mutation/reversion. The relevance of our results, derived from work on laboratory strains, to bacteria in their natural environment is an important issue. It is unclear what the role of phase variation is in the natural biology of this highly adapted pathogen. This phenomenon has been observed after passage of *B. pertussis* isolates *in vitro* in most cases. The isolation of Vir^-, or phase III, organisms from patients late in infection has been reported however[6]. We are currently examining vir^+/vir^- pairs derived from other isolates to determine if the frameshifting we have described represents a common mechanism for phase variation in *Bordetella* species. □

A new strategy for the generation of catalytic antibodies

THE high binding affinity and specificity of antibodies for a wide range of ligands has recently been exploited in the generation of catalysts for acyl-transfer reactions[1–7], carbon–carbon bond forming[8,9] and carbon–carbon bond cleaving reactions[10]. In addition, a number of strategies are emerging for the generation of catalytic antibodies including transition state stabilization[1–6], catalysis by approximation[7,8], and the introduction of catalytic groups or cofactors into antibody combining sites[10–13]. An important goal in the design of catalytic antibodies is the development of general rules relating hapten structure to the corresponding catalytic groups in the antibody combining site. We report here that electrostatic interactions between a hapten and the complementary antibody[14,15] can be exploited to generate catalytic amino-acid side chains in an antibody-combining site. The antibody-catalysed reaction, a β-elimination reaction, exhibits saturation kinetics, substrate specificity, competitive inhibition by hapten, and specific inactivation by a reagent that modifies carboxylate residues.

To expand the scope of antibody catalysis we targeted reactions involving proton abstraction from a carbon centre. This class of reactions includes elimination and isomerization reactions and aldol and Claisen condensations[16–18]. Proton abstraction in enzymes is often performed by carboxylate side chains of glutamate or aspartate amino acids. These residues typically display higher than normal pKa values (6.5–8.2) in the hydrophobic active sites of enzymes[19]. Aspartate and glutamate residues have been generated in the combining sites of antibodies by taking advantage of charge complementarity between haptens and the corresponding antibodies[14,15]. Consequently, we reasoned that an antibody-combining site could be generated that contains a carboxylate group within bonding distance of an abstractable substrate proton by using the appropriate positively charged hapten. Importantly, the position of a charged group such as alkyl ammonium ion in the hapten should reflect that of the target C–H group in the substrate.

To test these notions, monoclonal antibodies generated to hapten H1 (Fig. 1) were assayed for their ability to catalyse H–F elimination from the fluorinated substrate S2 (Fig. 1). The hapten contains a positively charged ammonium ion replacing the α-CH_2 group of the substrate (the tertiary nitrogen obviates competing lactam formation during the coupling of H1 to pro-

§ To whom correspondence should be addressed.

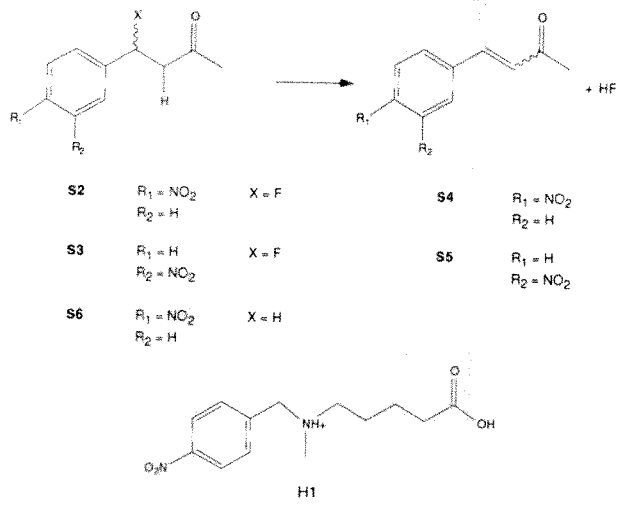

FIG. 1 Monoclonal antibodies elicited against the (KLH) conjugate of H catalyse the conversion of S2 or S4. Synthesis of H1 was accomplished b treatment of *p*-nitrobenzaldehyde and ∂-aminovaleric acid with 0. equivalents (eq.) of sodium cyanoborohydride ($NaCNBH_3$) in methanol at 25 ° to afford N(*p*-nitrobenzyl)-∂-aminovaleric acid which was purified by recrysta lization from H_2O/acetone. This compound was then treated with 37 aqueous formaldehyde and 2 eq. $NaCNBH_3$ in H_2O at 25 °C to afford H1 whic was purified by silica-gel chromatography. Compound H1 was coupled throug amide linkages to KLH by treatment with the *N*-hydroxysuccinimide ester c H1 to afford the KLH conjugate with an epitope density of 18 per carrie monomer as determined by the method of Habeeb[24]; protein concentratio was determined by the method of Lowry[25]. Synthesis of S2 was carried ou by treatment of *p*-nitrobenzaldehyde with a catalytic amount of 1% aqueou NaOH in acetone at 0 °C to give the intermediate (*R, S*) 4-hydroxy-4-*p* nitrophenylbutan-2-one which after purification by silica-gel chromatography treatment with diethylaminosulphur trifluoride in CH_2Cl_2 at −78 °C an aqueous extraction afforded racemic S2. Treatment of the intermediat alcohol with 1.1 eq of H_2SO_4 (1N) in acetone at 25 °C and purification b silica gel chromatography afforded the *trans* isomer of S4. Compounds S3 and S5 were synthesized analogously to S2 and S4 starting with 3-nitroben zaldehyde. Substrate analogue S6 was obtained by nitration of benzylacetone with $Cu(NO_3)_2 \cdot 3H_2O$ in neat trifluoroacetic anhydride at 39 °C and purified by silica gel chromatography. All compounds were characterized by NMR, mass spectrometry, infrared and ultraviolet spectroscopy and elemental analysis

tein carriers for immunization). The fact that the hapten and substrate share a common recognition element, the *p*-nitrophenyl group, ensured that the antibody-binding affinity for the substrate would be reasonable. Moreover, replacement of hapten by substrate in the antibody-combining site should lead to an increase in the basicity of the catalytic carboxylate since a stabilizing salt bridge interaction is lost.

Antibodies were generated against hapten H1, which at physiological pH exists as a positively charged alkyl ammonium ion. The hapten was conjugated to the carrier proteins bovine serum albumin (BSA) and keyhole limpet haemocyanin (KLH) using the activated *N*-hydroxysuccinimide ester of H1 (ref. 20). Six monoclonal antibodies specific for H1 were produced *in vivo* and isolated by affinity chromatography on protein A-coupled Sepharose 4B as decribed previously[3]. Antibody purity was determined by 10–15% SDS polyacrylamide gel electrophoresis with Coomasie blue staining[21]. Of these six IgGs isolated, four accelerated the β-elimination reaction of S2 to S4 (Fig. 1) and were completely inhibitable by the addition of free

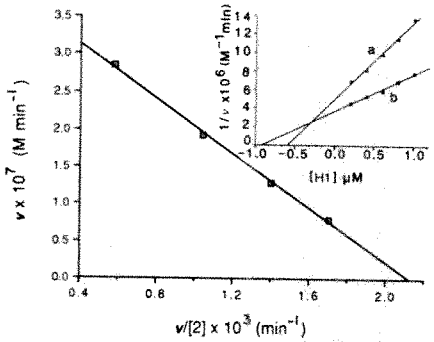

FIG. 2 Eadie–Hofstee plot for the β-elimination conversion of S2 to S4, catalysed by 43D4-3D3. Velocities were determined spectrophotometrically by measuring the initial absorbance increase at 330 nm: S2, $\lambda_{max} = 282$ nm (3.99); S4 $\lambda_{max} = 312$ nm (4.43); ΔE(S4–S2) (330 nm) = 16,820 $cm^{-1} M^{-1}$. The concentration of 43D4-3D3 was 2.00 μM as determined by absorbance at 280 nm using E(1 cm, 0.1%) = 1.37 and M_r = 150,000 for IgG. 43D4-3D3 was preincubated at 37 °C in 10 mM bis [2-hydroxyethyl]imino-tris-[hydroxymethyl]-methane (bis-Tris), 100 mM NaCl, pH 6.0. The reaction was initiated by adding 10 μl of a stock solution of S2 in CH_3CN to give a final CH_3CN concentration of 2%. The uncatalysed rate was measured under the same conditions, affording a $k_{uncat} = 1.30 \times 10^{-4}$ min^{-1}. Inset: Dixon plot[26] of inhibition of 43D4-3D3 by H1. Antibody concentration, 2.01 μM. Data was obtained at two concentrations of S2: *a*, 208 μM; *b*, 514 μM. Buffer conditions as above.

hapten H1. Such hapten-inhibitable rate acceleration suggests that the catalysis is due to binding of the substrate in the antibody-combining site (non-specific antibodies did not catalyse the elimination reaction). The fact that 66% of these antibodies were catalytic demonstrates the generality of this strategy for producing catalytic antibodies. One of the four antibodies (43D4-3D3) was characterized further.

The reaction catalysed by 43D4-3D3 obeys classical Michaelis–Menten kinetics: a k_{cat} of 0.193 min^{-1} and a K_M of 182 μM for substrate S2 were measured at pH 6.0 (Fig. 2). Both the *cis* and *trans* isomers of enone S4 are formed in the antibody-catalysed conversion of racemic S2, as determined by high pressure liquid chromatography (HPLC) analysis. The catalysed reaction is also competitively inhibited by hapten H1 (K_i = 290 nM) (Fig. 2 inset) demonstrating that the catalytic activity is associated with binding in the antibody-combining site. An unreactive substrate analogue *p*-nitrobenzylacetone (S6) is also a competitive inhibitor of the catalysed reaction ($K_i = 280$ μM). As expected, the antibody-catalysed reaction is substrate-specific, in accordance with the characteristic specificity of antibodies for their ligands[15]. The K_M and k_{cat} values for 4-fluoro-4-*m*-nitrophenylbutan-2-one (S3) are 571 μM and 0.079 min^{-1}, respectively ($k_{cat}/K_M = 1.38 \times 10^2$ M^{-1} min^{-1}) at pH 6.50, compared with a k_{cat} of 0.304 min^{-1} and K_M of 214 μM ($k_{cat}/K_M = 1.42 \times 10^3$ M^{-1} min^{-1}) for S2 at this pH.

The identity of the catalytic amino-acid side chain in the antibody combining site was probed by two methods. The pH dependence of k_{cat} shows the classical profile for catalysis attributable to a single titratable group (Fig. 3). The pK_a for the active site residue was determined to be 6.2. This value is very close to the pK_a for the active-site Glu 135 in carboxypeptidase A ($pK_a = 6.5$), which is known to be responsible for the catalysis of a similar β-elimination reaction (not the physiologically relevant reaction for this enzyme)[22]. The maximum k_{cat} value obtainable by the antibody results when the residue responsible

TABLE 1 Effect of DAA treatment of 43D4-3D3 on catalysis of S2 to S4

Sample	v (M^{-1} min^{-1})*	% activity remaining
Untreated	3.41×10^{-7}	100
DAA treated†	7.97×10^{-8}	23.4
DAA treated† + 2 mM S6	2.79×10^{-7}	82.0

* 1.5 μM 43D4-3D3, 540 μM S2, pH 6.0, 10 mM Bis-Tris, 100 mM NaCl.
† Following the procedure described in ref. 14.

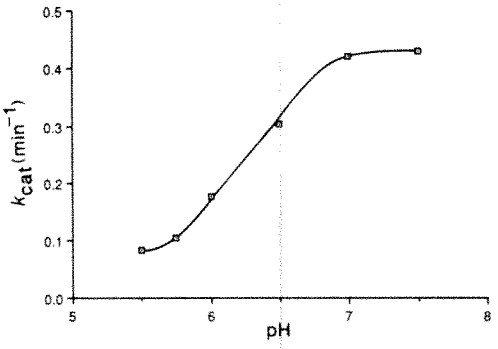

FIG. 3 The k_{cat} versus pH profile for conversion of S2 to S4 catalysed by 43D3-3D3. At each pH the k_{cat} value was obtained from a Lineweaver–Burke plot. The buffer used was 10 mM bis-Tris, in the presence of 100 mM NaCl.

for base catalysis is fully deprotonated. The value of k_{cat}(max), determined from the pH profile by plotting k_{cat} versus $k_{cat}[H^+]$, is 0.458 min^{-1} (ref. 23).

Chemical modification confirmed that an aspartate or glutamate residue is involved in the elimination reaction. Specific chemical modification of carboxylate residues was effected by treatment of 43D4-3D3 with diazoacetamide (DAA). DAA has been shown to react almost exclusively with carboxylate groups to form glycolamide ester linkages[14]. The antibody 43D4-3D3 retains only 23% of its catalytic activity after treatment with DAA. However, in the presence of competitive inhibitor S6 (2.0 mM), under otherwise identical conditions, 82% of its catalytic activity is retained. These results indicate that a carboxylate group could be located in or very near the binding site of 43D4-3D3.

The ability to generate antibody binding sites with specific catalytic groups or microenvironments provides a method for dissecting the contribution of various factors involved in enzymatic catalysis, such as transition-state stabilization, proximity effects, general acid-base, nucleophilic catalysis and ground state strain. Hapten H1 bears very little resemblance to the transition state for the conversion of S2 to S4; in fact it has the opposite charge of an E2 elimination transition state. This observation, together with the pH profile (Fig. 3), suggests that the observed catalysis is largely due to the presence of a catalytic base. The rate constant for acetate-catalysed conversion of S2 to S4, k_{OAc^-}, is 1.13×10^{-2} M^{-1} min^{-1} at 37 °C in 100 mM NaCl. The k_{cat}/K_M value of the antibody-catalysed reaction at pH 6 is 9.95×10^2 M^{-1} min^{-1}. The rate enhancement obtained by introduction of a carboxylate residue in a hydrophobic binding site compared with acetate free in solution is therefore 8.80×10^4 at the pH. This value is similar to that of 6×10^4 reported for an esterolytic antibody that ccontains an active site nucleophilic thiol[12]. The large rate enhancement due solely to base catalysis by a carboxyliate residue suggests that an antibody which combines transition state stabilization and base catalysis might attain rate accelerations similar to those of enzymes. Nuclear magnetic resonance experiments and resolution of the *R*, *S* stereoisomers of S2 are currently in progress to determine the stereochemistry of proton abstraction (pro*R*, pro*S*) and elimination (*syn*-coplanar, *anti*-coplanar).

This work represents the extension of antibody catalysis to a new class of reactions. Moreover, it should be possible to exploit hapten complementarity to generate antibodies which contain other catalytic groups and catalyse a variety of reactions of interest, including aldol and Claisen condensations, as well as amide and sugar hydrolyses.

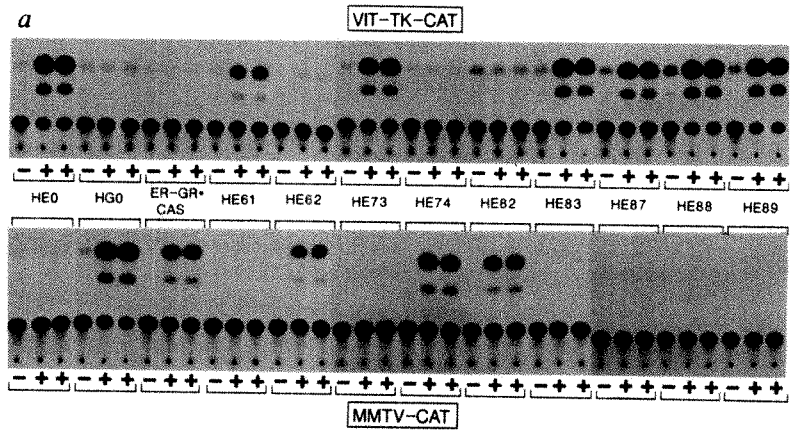
Three amino acids of the oestrogen receptor are essential to its ability to distinguish an oestrogen from a glucocorticoid-responsive element

Sylvie Mader, Vijay Kumar*, Hubert de Verneuil & Pierre Chambon†

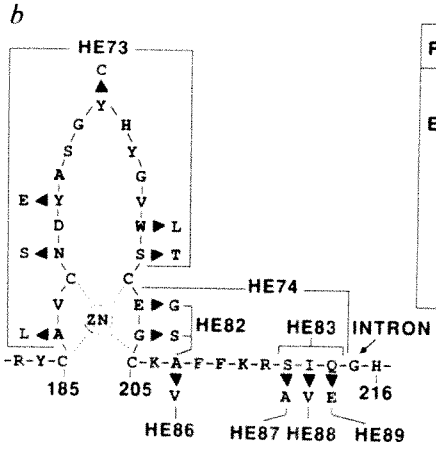
Laboratoire de Génétique Moléculaire des Eucaryotes du CNRS, Unité 184 de Biologie Moléculaire et de Génie Génétique de l'INSERM, Institut de Chimie Biologique, Faculté de Médecine, 11 rue Humann, 67085 Strasbourg Cédex, France

STEROID hormone receptors activate specific gene transcription by binding as hormone-receptor complexes to DNA enhancer elements termed hormone responsive elements (refs 1, 2 and references therein). A highly conserved 66-amino-acid region of the oestrogen and glucocorticoid receptors which corresponds to part of the receptor DNA-binding domain (region C) determines the specificity of target gene recognition[3–5]. This region contains two subregions (CI and CII), encoded in two separate exons (refs 1, 7 and references therein), that are analogous to the 'zinc fingers' of the transcription factor TFIIIA (reviewed in ref. 6). The N-terminal CI finger determines the recognition specificity of the hormone responsive element[8]. A chimaeric oestrogen receptor, in which the CI finger is replaced with the corresponding glucocorticoid receptor CI finger region, activates transcription from a reporter gene containing a glucocorticoid-responsive element, but not from a reporter gene containing an oestrogen-responsive element[8]. We report here that three amino acids located at the C-terminal side of the oestrogen receptor CI finger play a key part in this specificity.

In the reporter gene *vit-tk-CAT* (ref. 9), the 5'-flanking region of the *Xenopus* vitellogenin A2 gene (*vit*), which contains a consensus palindromic oestrogen-responsive element (ERE), is inserted upstream of the herpes simplex virus promoter for thymidine kinase (*tk*). In the mouse mammary tumour virus (MMTV) reporter gene MMTV-*CAT*, the glucocorticoid-



* Present address: International Centre for Genetic Engineering and Biotechnology, NII Campus Shaddeo Jeet Singh Marg, New Delhi 67, India.
† To whom correspondence should be addressed.



responsive element (GRE) in the long terminal repeat of MMTV is positioned upstream of the *CAT*-indicator gene. It can be seen from Figs 1 and 2 that co-transfection of HeLa cells with the wild-type human oestrogen receptor (hER) expression vector HEO resulted, as expected, in the activation of *vit-tk-CAT* expression (but not of MMTV-*CAT* expression) in the presence (+) of oestradiol; MMTV-*CAT* expression, however, was specifically stimulated by the human glucocorticoid receptor (hGR) expression vector HGO in the presence (+) of dexamethasone. Note that essentially the same variations in target gene specificities were observed for the various receptor mutants studied below when a reporter containing a consensus GRE (GRE-*tk-CAT*, see ref. 8) was used as a glucocorticoid receptor (GR) reporter instead of MMTV-*CAT* (data not shown).

In agreement with our earlier results, the chimaeric receptors ER-GR.CAS (refs 3, 4) and HE62 (ref. 8) (in which the 66-amino-acid core and the CI N-terminal finger of region C of HEO were respectively replaced with the corresponding regions of hGR) activated the expression of MMTV-*CAT* but not of *vit-tk-CAT* (Fig. 1*a* and *b*). Conversely, HE61 (ref. 8) (in which the CII subregion of HEO was replaced with that of hGR) activated expression of *vit-tk-CAT*, but not of MMTV-*CAT*. To further delineate the amino acids responsible for this change of specificity, two new hER mutants were created in region CI of HEO. In HE73 (Fig. 1*b*), the N-terminal side (amino acids 185 to 188) and the finger tip (amino acids 189 to 201) were changed from the amino acids of hER to those of hGR, and in HE74 the C-terminal side amino acids 202 to 215 were changed (amino acid changes indicated by arrowheads in Fig. 1*b*; see also Fig. 4). HE73 retained the oestrogen-receptor (ER) specificity, whereas HE74 acquired the ability to activate MMTV-*CAT* but completely lost its capacity to activate *vit-tk-CAT* (Fig. 1*a* and *b*). Further mutagenesis demonstrated that the change in targ gene specificity observed with HE74 was essentially due to th replacement of three amino acids. Substitution of only thes three discriminating amino acids (HE82) causes a comple change of specificity (compare HE82, HE83, HE87, HE88 an HE89 in Fig. 1*a* and *b*).

To investigate the individual role of these three discriminatin residues, a series of single amino-acid substitutions was mad Each single substitution clearly decreased the efficiency of th corresponding proteins to act as ERs to a similar extent (HE8 HE85, HE86; Fig. 2*a* and *b*), but their target gene specificit was not changed. (Note, however, that HE84 slightly stimulate MMTV-*CAT*.) In contrast, a change in specificity was observe when substituting pairs of the discriminating amino acids wit the corresponding GR residues (HE90, HE91, HE92 in Fig. 2 and *b*). The two combinations that involve the Glu to Gl (E→G) substitution (HE90 and HE91) resulted in a loss of El function and a concomitant appearance of GR target gen specificity; this was particularly marked in HE91 (E, A→G, V) But HE92, in which the ER Glu203 was unchanged, recognize both ER and GR target genes, albeit with limited activatin capacity. Note that all receptor mutants were present in abou the same amount in the transfected HeLa cells, as judged fron western immunoblotting (Fig. 3 and data not shown), and tha the observed variations in reporter gene activation were therefor not due to differences in synthesis or stability of the mutate receptors.

Our results establish that three amino acids are of key import ance to the ability of the ER to discriminate between an ERE and a GRE. Interestingly, these three amino acids are no situated in the tip of the CI finger, but on its carboxyl side. I has been proposed that this side of the zinc finger may form ar

FIG. 1 Target gene specificity of hER mutants containing hER to hGR amino-acid substitutions in the DNA-binding domain subregion CI. *a*, The expression vectors HEO (ref. 4), HGO (ref. 4), ER-GR.CAS (ref. 3), HE61 (ref. 8), HE62 (ref. 8), HE73, HE74, HE82, HE83, HE87, HE88 and HE89 were co-transfected into HeLa cells with either the oestrogen-responsive *vit-tk-CAT* or the glucocorticoid-responsive MMTV-*CAT* reporter genes. Oestradiol (10^{-8} M) was added when indicated (+) to transfections with HEO and its mutant derivatives and dexamethasone (10^{-7} M) was added to transfections with HGO. *b*, The CI region of hER (amino acids 185 to 215; one-letter terminology) with its potential 'zinc finger' is represented and the position of the second intron of the hER gene is indicated[7]. The positions of the amino-acid substitutions are indicated by an arrowhead pointing to the corresponding amino acid in hGR. The extent of the mutated region in each recombinant is defined by thin lines. Single average values (±20%) for the transcriptional activation of the two reporter genes (relative to either HEO or HGO, taken as 100%) result from three or more independent transfections with at least two different plasmid preparations. When two values are given, they correspond to two independent transfections with two different plasmid preparations. *Vit-tk-CAT* and MMTV-*CAT* expression were stimulated about 50- and 200-fold by HEO and HGO respectively.

METHODS. HeLa cells at ~40% confluence were co-transfected with 1 μg receptor expression vector, 1 μg *vit-tk-CAT* or MMTV-*CAT* reporter gene and 3 μg pCH110 (Pharmacia; a β-galactosidase expression vector used as a reference gene to normalize for variations in transfection efficiency). Transfection, preparation of cell extracts and quantitative determination of CAT activity have been described[8]. Mutagenesis of hER to generate HE73, HE74, HE82, HE83, HE87, HE88 and HE89 was essentially as described[8], except that we used hER cloned into the *Eco*RI site in pSG5 (ref. 19) instead of that in pSG1. The sequences of the synthetic oligonucleotides used for site-directed mutagenesis are available on request.

α-helix that interacts with the DNA major groove, so it could be responsible for specific recognition of the cognate DNA sequence (refs 8, 10, 11 and references therein). Indeed, a putative α-helix motif located on the carboxyl side of the zinc finger in the DNA-binding domain of the yeast LAC9 regulatory protein may be largely responsible for the binding specificity[12].

The consensus palindromic ERE and GRE, to which the corresponding receptors bind as dimers[5], differ by only two base pairs in each stem of the palindrome (ERE: TGACC versus GRE: TGTTC) (refs 1, 13, 14 and references therein). It is likely that the three amino acids characterized here are central to the discrimination between these two base pairs. Other amino acids conserved between the ER and GR CI subregion (see Fig. 4) are probably important either for specific interactions with the conserved bases of the palindromic elements or for non-specific interactions with the DNA backbone (see ref. 8 for a discussion of the possible role of the CII subregion in the overall efficiency of receptor binding to its responsive element (RE). That only two amino-acid substitutions (see mutant HE91 in Fig. 2) are required for the discrimination between two related REs, readily indicates that new receptors and REs might have co-evolved from their respective ancestors (note also the intermediate case of mutant HE92). Also, one would predict that nuclear receptors which share the same three discriminating amino acids should be able to activate the same RE. Comparison of the amino-acid sequences of eight nuclear receptors (see Fig. 4) shows that the amino-acid sequence of the carboxyl side of the CI finger is

FIG. 2 Target-gene specificity of hER mutants with amino acids 203, 204 and/or 207 changed to their GR homologues. *a*, Assay for CAT activity after transfection into HeLa cells of the expression vectors HE0, HG0, HE74, HE82, HE84, HE85, HE86, HE90, HE91 and HE92, together with either the *vit-tk-CAT* or MMTV-*CAT* reporter genes. Oestradiol and dexamethasone were added as described in Fig. 1*a* legend. *b*, The position of the amino-acid substitutions is as indicated in Fig. 1*b*. The transcriptional activation of the two reporter genes by the various hER mutants was expressed relative to HE0 and HG0, as indicated in Fig. 1*b*. Mutagenesis of hER to generate HE84, HE85, HE86, HE90, HE91 and HE92 and all other methods were performed as described in the legend to Fig. 1, except that cell-extract aliquots corresponding to five-times less β-galactosidase activity were used for CAT assays in the case of HE0 and HG0 transfections.

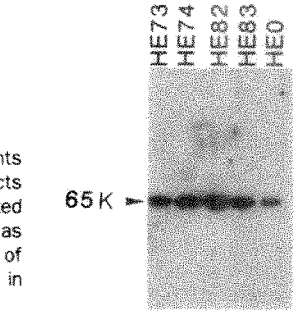

FIG. 3 Western blot analysis of hER mutants transiently expressed in HeLa cells. Extracts from HeLa cells were transfected as indicated and processed for immunoblot analysis as described[8]. The relative molecular mass of the receptor mutants is indicated in thousands.

remarkably conserved, with the striking exception of the three discriminating amino acids (indicated by arrows in Fig. 4); two subfamilies can be identified (Fig. 4*a* and *b*). The four members of one of these subfamilies (Fig. 4*a*) are known to recognize a common RE (refs 15, 16 and references therein). Moreover, it has recently been shown (ref. 17; H. de V., D. Metzger and P.C., manuscript in preparation) that two members of the second subfamily (Fig. 4*b*) which share the same three discriminating amino acids (retinoic acid receptor and thyroid hormone receptor, RAR and T3R respectively) may recognize a common palindromic RE, which is related to the ERE. (Considering the sequence similarities, it is probable that the RE of the vitamin D3 receptor is also close to that of RAR and T3R.) Interestingly, we have recently found (H. de V., D. Metzger and P.M., manuscript in preparation) that both T3R and RAR, which share two out of the three discriminating amino acids with the ER, can activate transcription of a reporter gene containing an ERE (but not a GRE), albeit with a lower efficiency than the ER (see also ref. 18 for an account of a weak stimulation of *vit-tk-CAT* by RAR). This observation is consistent with the properties of HE86, which contains the two discriminating amino acids common to ER, T3R and RAR, and specifically activates *vit-tk-CAT*, although with less efficiency than the wild-type hER (HE0) (Fig. 2).

Finally, it should be stressed that our data do not exclude the possibility that additional amino acids (such as some of those located in the finger tip) might help in the discrimination between an ERE and a GRE, although the amino acids we have identified here are sufficient. In this respect we note that HE82 is significantly less efficient than HG0 in the activation of MMTV-*CAT* (Fig. 1), and that its affinity for a GRE *in vitro* is lower than that of the GR (unpublished data). Additional

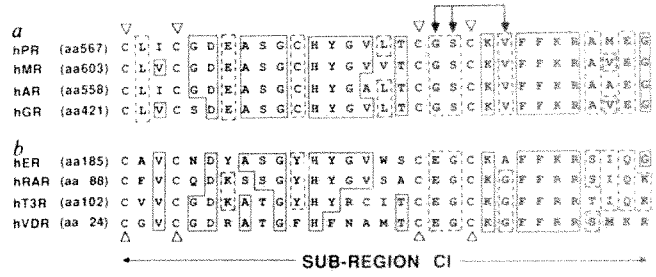

FIG. 4 Comparison of the amino-acid sequences of the subregion CI (N-terminal 'zinc finger') of the DNA-binding domain (region C) of various members of the human nuclear receptor family. The conserved cysteine residues that may tetrahydrally coordinate zinc to form a 'zinc finger' (see Fig. 1*b*) are indicated by open arrowheads. The arrows point to the position of the three 'discriminating' amino acids (see text). Amino acids which are common to only one of the two subfamilies (*a*, hPR, hMR, hAR and hGR; *b*, hER, hRAR, hT3R and hVDR; see text) are boxed with dashed lines, whereas those common to the two subfamilies are boxed with solid lines. The receptors hPR (ref. 20), hMR (ref. 16), hAR (ref. 21), hGR (ref. 22), hER (ref. 23), hRAR (refs 18 and 24), hT3R (ref. 25) and hVDR (ref. 26) are the progesterone, mineralocorticoid, androgen, glucocorticoid, oestrogen, retinoic acid, thyroid hormone and vitamin D3 receptors respectively.

mutagenesis aimed at identifying such possible helper amino acids is in progress. □

Fertile transgenic rice plants regenerated from transformed protoplasts

Ko Shimamoto, Rie Terada, Takeshi Izawa & Hideya Fujimoto

Plantech Research Institute, 1000 Kamoshida, Midori-ku, Yokohama, 227, Japan

THE generation of transgenic plants using gene transfer techniques is important to both the investigation of gene regulation and the genetic engineering of crops[1]. The Ti plasmid of *Agrobacterium tumefaciens* is now routinely used to transform dicotyledonous plants[2], and the transfer of foreign genes to unorganized tissue[3–6] and plants[7,8] has been accomplished using direct DNA transfer methods[9–11]. A protocol for the easy and reproducible production of fertile transgenic cereals, however, has not yet been described. We report here the production of fertile transgenic rice plants obtained by introducing the bacterial *hph* gene, encoding hygromycin B resistance[12] (Hm^r), into protoplasts of *Oryza sativa* (L.) by electroporation. The non-selectable gene encoding β-glucuronidase was also transferred with the *hph* gene and its expression was detected in the progeny of the stable transformant.

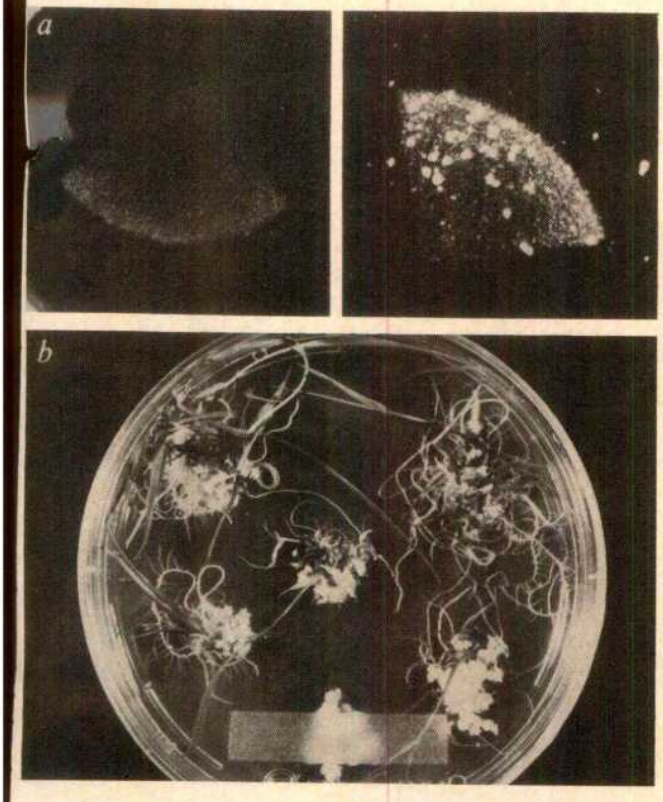
The kanamycin resistance (Km^r) gene coding for neomycin phosphotransferase II (NPT II) is often used as a selectable marker to produce transgenic plants[1]. We found, however, that the bacterial *hph* gene is a more effective marker for the selection of stable transformants from embryogenic rice protoplasts and on the basis of this we chose, as an integration vector, plasmid pGL2, which carries the *hph* gene flanked by the 35S promoter and a polyadenylation site from cauliflower mosaic virus[13] (CaMV) (Fig. 2*a*).

Because embryogenic protoplasts of rice are small (10–20 μm in diameter), electroporation was carried out using a long pulse (10 ms), generated by a large capacitor (800 μF) and a moderate voltage (300 V cm^{-1}). Under these conditions, the plating efficiency (0.2–1.2%, Table 1) was 10–20% of that of non electroporated control protoplasts grown by the nurse cultur method[14]. No modification of the original protocol was require for the culture of electroporated protoplasts. After 2–3 week of selection wth hygromycin B (20 μg ml^{-1}), resistant colonie became clearly visible (Fig. 1*a*). Little background colon growth was observed in control experiments in which hygro mycin B (20 μg ml^{-1}) was added to the R2 medium[15] 2 week after electroporation.

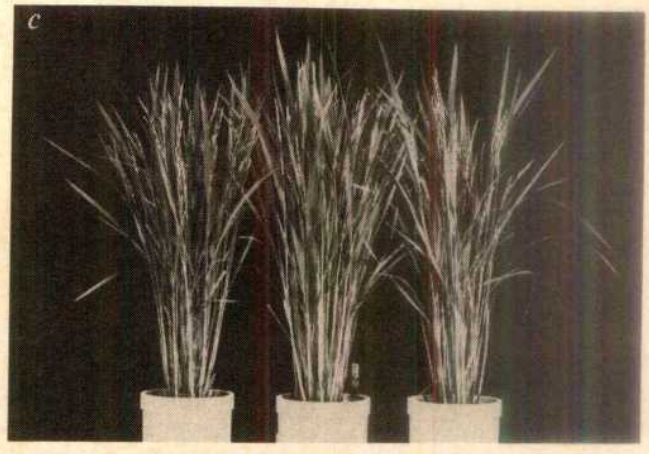
The frequency of resulting Hm^r clones depended on th protoplast preparation and the cuvettes used for electroporatio (Table 1). In all the experiments, the transformation frequencie fell in the range 0.1–0.6% of clones subjected to selection. Thi range is lower than those obtained for the recovery of Km clones after the electroporation of maize protoplasts[5,8] and th treatment of non-embryogenic rice protoplasts with polyethyl ene glycol (PEG)[6].

Most of the Hm^r colonies continued to grow after transferrin them to a solid N6 medium[16] containing the same concentratio of hygromycin B. Three to four weeks later, the Hm^r calli were transferred to an N6 regeneration medium[14] containing nc hygromycin B. Within 3–6 weeks, shoots as well as roots became visible. The efficiency of regeneration is evident from the fac that more than 50% of the Hm^r calli yielded shoots in every experiment (Fig. 1*b*).

The presence of the *hph* gene on the chromosomes of stable transformants was shown by a Southern blot analysis of the plants regenerated from Hm^r calli (Fig. 2*a–c*). After the digestion of genomic DNA with *Bam*H1, six plants from four different experiments were found to contain a 1.1-kilobase (kb) fragment that hybridized to the *hph* gene (lanes 3–8). The detection of multiple bands, after digestion with *Eco*RV (lanes 9–11), indicated the presence of multiple chromosomal integration sites. By using a mixed probe containing both the *hph* probe and a single copy gene probe, the copy number of the integrated *hph* gene was estimated to be 2–10 per doploid cell (data not shown).



Plantlets regenerated from Hm^r calli were transferred to pots where they grew to maturity, flowered and set seeds (Fig. 1*c*). From fourteen such plants, we chose four, plants 3-1, 6-1, 6-3 and 8-1, to study the transmission of the *hph* gene. Thus, selfed seeds were subjected to hygromycin B at a concentration (30 μg ml^{-1}) previously found to be sufficient to inhibit the germination of control seeds. The subsequent survival of selfed seeds showed that the active *hph* gene had been transmitted to the progeny (Fig. 1*d*; Table 2).



Further evidence for this transmission was obtained by germinating selfed seeds in the absence of hygromycin B and analysing their DNAs by Southern hybridization (Fig. 2*c*). Among ten progeny from the plant 6-3, seven contained the *hph* gene. Similarly, among nine progeny from the plant 8-1, six contained sequences hybridizing the *hph* gene. The two bands which hybridized the *hph* gene were found to co-segregate in the progeny of the plant 8-1. These results indicate that either a single insert or multiple inserts of the functional *hph* gene are present on the chromosomes of the primary transformants. To clarify the mode of transmission of the integrated *hph* gene, selfed and backcross progeny of other transformants are now being investigated.

TABLE 2 Transmission of the Hm^r phenotype to progeny

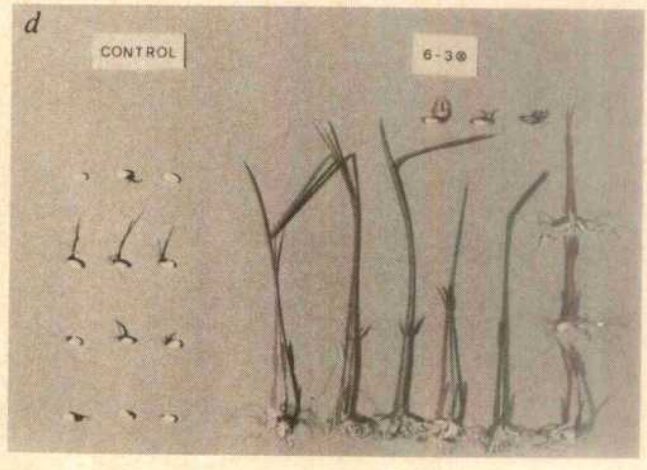
The methods for testing the Hm^r phenotype are described in Fig. 1*d*.



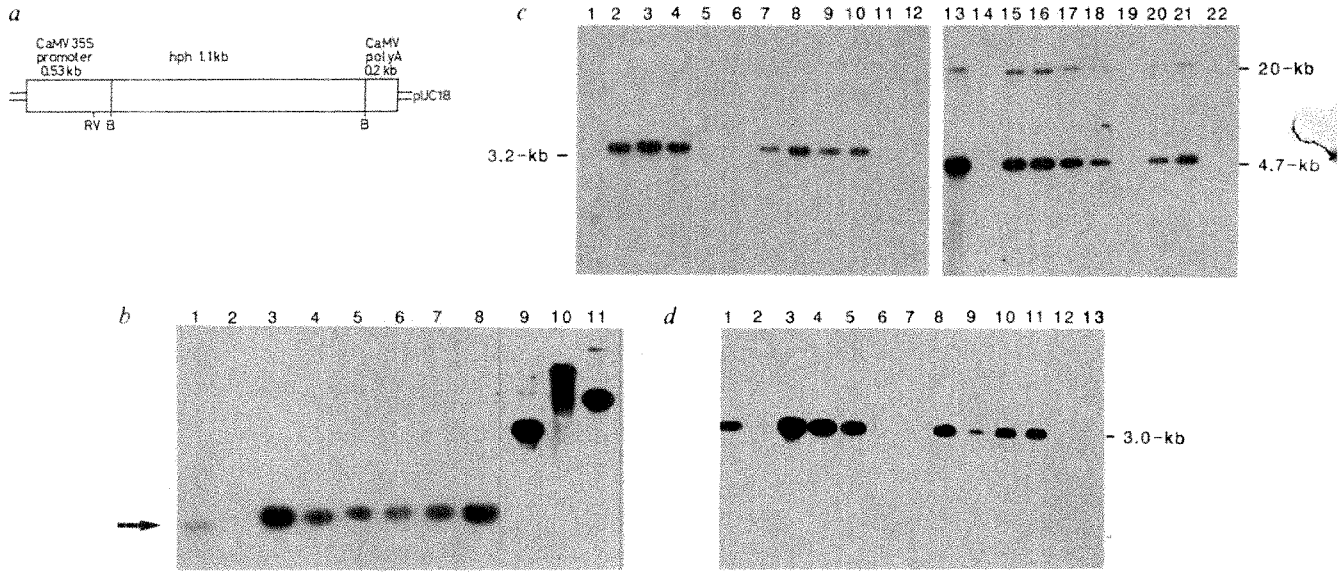


FIG. 1 Selection, plant regeneration and progeny analysis of transformants. *a*, Growing Hm^r colonies after 3 weeks of selection with 20 μg ml^{-1} hygromycin B (5 weeks after electroporation). Protoplasts were electroporated in the presence of plasmid DNA and carrier DNA (right); control culture electroporated with carrier DNA alone (left), *b*, Regeneration of shoots and roots from Hm^r calli, *c*, Fertile plants obtained from Hm^r calli. *d*, Test of the Hm^r phenotype in the control seeds (left) and the progeny of the transformant 6-3 (right). METHODS. Protoplasts were isolated from 1–2-month-old suspension cultures derived from mature embryo calli of *cv. Nipponbare* as described previously[14]. The protoplasts were washed twice and resuspended (4×10^6 protoplasts ml^{-1}) in a buffer containing 70 mM KCl, 5 mM $MgCl_2$, 0.1% MES, pH 5.8 and 0.4 M mannitol. Aliquots (0.5 ml) of the protoplast suspension were mixed with the supercoiled pGL2 plasmid DNA (10 μg ml^{-1}) and carrier DNA (50 μg ml^{-1}). Carrier DNA was prepared by dissolving calf thymus DNA (Sigma) in 10 mM Tris-HCl, 1 mM EDTA, pH 8.0 and sterilized using a disposable filter. After the incubation of the protoplast-DNA mixture in ice for 5 min, a sample (0.5 ml) was transferred to a precooled plastic cuvette and electroporated by a capacitor-discharge system (X-cell 450, Promega). After 10 min at 4 °C, protoplasts were mixed with 0.5 ml of the molten agar R2 medium[15] containing 2.5% agarose (Sea Plaque, FMC) in a plastic plate (35 mm in diameter). After cooling, the agarose was cut into four blocks, which were transferred to a plastic plate (6 cm in diameter) containing 5 ml of the R2 medium and cultured by the nurse culture method[14]. Hygromycin B (Sigma) was added to the medium 2 weeks later at a final concentration of 20 μg ml^{-1}. Agarose blocks containing growing colonies were transferred 2–3 weeks later to an N6 soft agar medium[16] containing 20 μg ml^{-1} hygromycin B and incubated for 1–2 weeks. Individual colonies were then transferred to the same N6 medium with increased agarose concentration (0.5%). When the calli were ~5 mm in diameter, they were transferred to the regeneration medium. Plant regeneration was as described previously[14]. For analysis of Hm^r in progeny, selfed seeds were sterilized in 0.6% $NaClO_4$, washed twice in sterile distilled water and placed onto MS medium[19] containing 30 μg ml^{-1} hygromycin B. They were incubated for 2 weeks at 25 °C under light.

TABLE 1 Frequency of Hm^r clones

Experiment	Cuvette	pGL2 (μg ml^{-1})	No. protoplasts used ($\times 10^6$)	No. clones tested for Hm^r ($\times 10^3$)	No. Hm^r clones found	Frequency of stable transformations (%)
I	1	0	2	10.5	0	0
	2	10	2	14.3	65	0.45
	3	10	2	14.5	58	0.40
	4	10	2	11.6	75	0.65
	5	10	2	13.7	70	0.50
	6	10	2	12.4	80	0.60
II	1	0	2	17.8	0	0
	2	10	2	24.0	32	0.13
	3	10	2	18.0	27	0.15
	4	10	2	4.8	12	0.25

Experiments I and II consisted of several electroporation trials, each of which was performed with a cuvette, using protoplasts derived from one preparation. Colonies subjected to selection for Hm^r were counted 12 days after electroporation. The number of Hm^r clones was scored after 3 weeks of culture in the presence of 20 μg ml^{-1} hygromycin B.

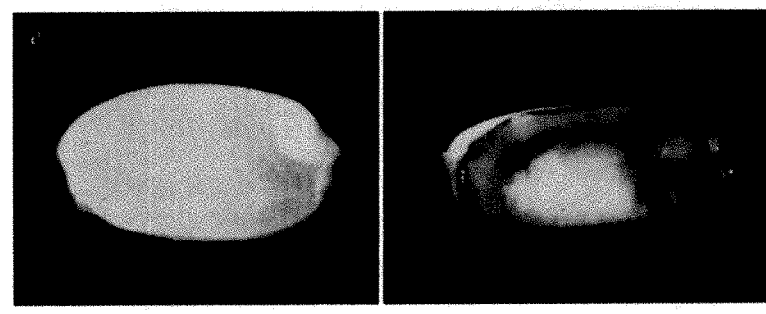

FIG. 2 Molecular confirmation of the chromosomal integration of the foreign genes. *a*, Diagram of pGL2. pGL2 is a pUC18 derivative carrying the 35S promoter and a polyadenylation site of CaMV (ref. 13) together with the *Bam*H1 segment containing the *hph* gene derived from pLG88 (ref. 20). It contains a unique *Eco*RV site within the 35S promoter region: B, *Bam*H1; RV, *Eco*RV. *b–d*, Southern blot analysis of the genomic DNA from primary transformants and their progeny. *b*, Genomic DNA from nine independent Hm^r plants digested with *Bam*H1 or *Eco*RV. Lane 1, 1.1-kb *Bam*H1 fragment of pGL2 containing the *hph* gene indicated by arrow; lane 2, DNA from non-transformed plants; lane 3–8, *Bam*H1-digested DNA from 6 independent Hm^r plants; lane 9–11, *Eco*RV-digested DNA from three Hm^r plants. *c*, DNA from progeny of transformants 6-3 and 8-1 digested with *Eco*RV. Lane 1, DNA from non-transformed plants; lane 2, DNA from the transformant 6-3; lanes 3–12, DNA from 10 progeny of the transformant 6-3; lane 13, DNA from the transformant 8-1; lanes 14–22, DNA from nine progeny of the plant 8-1. *d*, DNA from the GUS transformant G1 and its progeny digested with *Eco*RI and *Hin*dIII. Lane 1, pBI221 digested with *Eco*RI and *Hin*dIII,; lane 2, DNA from non-transformed plants; lane 3, DNA from the primary transformant G1; lanes 4–13, DNA from 10 progeny. *e*, Expression in the seed of the GUS marker co-transformed with pGL2. Left, control seed; right, progeny seed expressing GUS activity.

METHODS. DNA samples were prepared from transgenic plants according to a published protocol[21]. For Southern blot analysis[22], 1–2 μg of digested DNA was electrophoresed in a 1.0% agarose gel, transferred to a nylon membrane (Bio-Rad) and the blots were hybridized with the ^{32}P-labelled[23] 1.1-kb *Bam*H1 fragment of pGL2 corresponding to the *hph* gene (*b*, *c*) or 1.9-kb *Xba*I-*Sst*I fragment of pBI221 corresponding to the GUS gene (*d*). The *Bam*H1 fragment of pGL2 (10 pg) (*a*) or 12 pg of pBI221 digested with *Eco*RI and *Hin*dIII (*c*) was electrophoresed as a marker. For cotransformation of the GUS marker with the *hph* gene, 20 μg ml^{-1} of pBI221 was mixed with 10 μg ml^{-1} of pGL2 and 50 μg ml^{-1} of carrier DNA and electroporated as described in Fig. 1. For histochemical staining of the GUS activity, seeds were cut into halves and stained with X-gluc according to ref. 24.

A preliminary experiment to examine co-transformation of an unlinked, non-selectable gene was performed using the β-glucuronidase (GUS) gene under the control of the CaMV 35S promoter and the 3′ region of the nopaline synthetase gene[17]. The addition of this GUS plasmid (20 μg ml^{-1}) did not influence the plating efficiency or the frequency of Hm^r colonies. The selfed seeds of one of the Hm^r plants that showed GUS activity in their leaf extracts, referred to as G1, were subjected to further analyses. Southern blot analysis of G1 and its progeny showed that 7 out of 10 progeny plants contained the complete 3.0-kb GUS gene (Fig. 2*d*). The progeny seeds were individually cut into two halves and stained with 5-bromo-4-chloro-3-indolylglucuronide (X-gluc) to detect GUS activity. Whereas no activity was detected in 20 untransformed control seeds, 41 out of 57 transformed seeds were found to have GUS activity in the embryo and the endosperm (Fig. 2*e*), indicating that the GUS gene, integrated in the primary transformant, is stably inherited by progeny.

These results demonstrate that the co-transformation of a non-selectable gene with a selectable marker can be used to generate fertile transgenic rice. It seems that the construction of a plasmid carrying both the selectable marker and the non-selectable gene is not a prerequisite for the successful transfer of the latter, and that, as observed in the case of tobacco[18], co-transformation is a simple alternative method for generating transgenic plants carrying active genes. □

PHOSPHATIDYLINOSITOL (PI)-SPECIFIC PHOSPHOLIPASE C -A NEW POWERFUL TOOL FOR MEMBRANE RESEARCH

Professor Hiroh Ikezawa of Nagoya City University, a founder of PI-anchoring protein, now presents a splendid tool to biochemists, immunologists and membranologists.

"THE PHOSPHATIDYLINOSITOL (PI)-SPECIFIC PHOSPHOLIPASE C"

Sapporo Breweries Co., Ltd. prepares and Funakoshi Pharmaceutical Co., Ltd. distributes exclusively this enzyme from *Bacillus thuringiensis*, in response to the requests of users. Indeed, PI-specific phospholipase C will solve many problems on the presence, structure and biosynthesis of PI-anchoring proteins such as alkaline phosphatase, Thy-1, acetylcholine esterase and so on.

Clark-style Oxygen Electrodes

#737
Glass Microelectrode

- Measures PO_2/ PH_2 in plant & animal tissues, sediments, & soils
- Response time < 1 second
- Tip diameter: 20-250 µm
- Low O_2 consumption
- Insensitive to stirring

#1 #1600 FASEB

Microphysiology instrumentation and sensors

#747 **Needle Oxygen Sensor**

- Glass insulated microelectrode in a stainless steel needle
- Low penetration capability
- Easy to calibrate
- Designed to measure oxygen in tissue

Announcing a new journal from Humana Press!

RECEPTOR

Editor-in-Chief: *Gerald Litwack, PhD*
Fels Institute for Cancer Research and Molecular Biology, Temple University School of Medicine, Philadelphia, Pennsylvania

The distinguished Editorial Board will include:
• **Miguel Beato,** *Marburg, FRG* • **David B. Bylund,** *Columbia, Mo.* • **Hector DeLuca,** *Madison, Wis.* • **William L. Duax,** *Buffalo, N.Y.* • **Jenny P. Glusker,** *Philadelphia, Pa.* • **Mark I. Greene,** *Philadelphia, Pa.* • **Jeffrey M. Harmon,** *Bethesda, Md.* • **Bradford Jameson,** *Philadelphia, Pa.* • **C. Ronald Kahn,** *Boston, Mass.* • **James Keen,** *Philadelphia, Pa.* • **Salomon Z. Langer,** *Paris, France* • **Craig Malbon,** *Stony Brook, N.Y.* • **Kenneth P. Minneman,** *Atlanta, Ga.* • **Gavril W. Pasternak,** *New York, N.Y.* • **Robert R. Ruffolo,** *King of Prussia, Pa.* • **S. Stoney Simons, Jr.,** *Bethesda, Md.* • **Patricia G. Spear,** *Chicago, Ill.* • **Pieter B. Timmermans,** *Wilmington, Del.* • **Michael D. Waterfield,** *London, U.K.*

RECEPTOR is a timely new journal devoted to one of today's central topics in biological and biomedical research. Published quarterly at first, **RECEPTOR** will focus on all phases of modern research on receptors involving every class of organism. International in scope, **RECEPTOR** will feature outstanding papers on a wide variety of topics, including: • neurotransmitters • hormones • antibodies • viruses • growth factors • vitamins and other nutrients • other specific sites for chemical signals • measurements made *in vitro* and in purified systems • crystallographic data • molecular modeling • receptor second messengers, transducers, and oncogene receptor phenotypes • molecular biology of receptors • regulation of receptors *in vitro* or within cells.

In addition to providing the reader with up-to-the-minute data in this rapidly expanding field, **RECEPTOR** will also contain minireviews, full-length reviews, and a special section for the scientific reporting of new developments in contexts that should catalyze the interests of researchers working in any area of receptor research.

The first issue of **RECEPTOR** is scheduled to appear in the summer of 1989.

CALL FOR PAPERS

Manuscripts should be prepared using the standard style of the ACS journal, *Biochemistry*. Please address all editorial correspondence, queries, and manuscripts for consideration to:

Gerald Litwack, PhD, Fels Institute for Cancer Research and Molecular Biology, Temple University School of Medicine, 3420 North Broad Street, Philadelphia, Pennsylvania 19140 (USA)

Published Quarterly. 1989: Volume 1

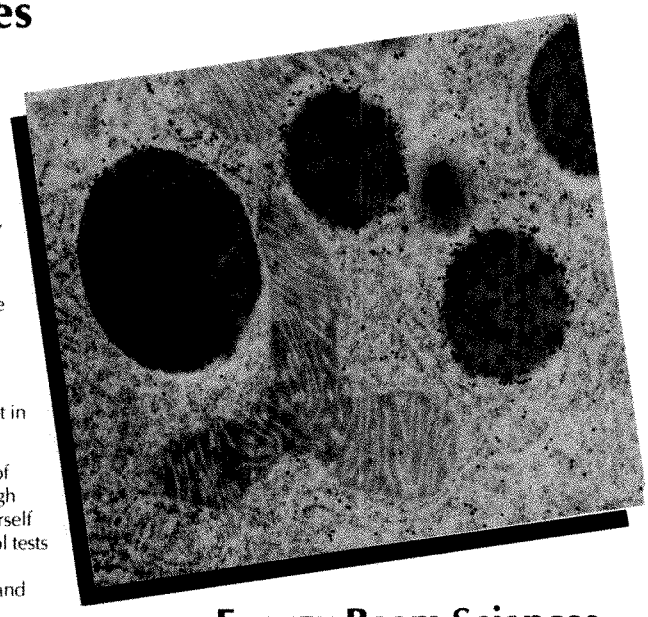
BioCell
Gold Conjugates



There are many advantages in using gold probes for identification of proteins and antigens in tissue sections and cell suspensions (EM, LM), protein blots (Western blotting), and DNA fragments (Southern blotting and in situ hybridisation). Gold probes are safe, sensitive, accurate, permanent, inexpensive and easy to use.

But if your research is aiming to be the best, can you afford to use less than the best materials?

BIOCELL only make the best. Best in sensitivity. Narrowest in particle size variation. Lowest in clustering. Highest in concentration. Best in value.

Prove it! Write or call now for details of FREE TRIAL SAMPLES of any of our high quality gold conjugates. Try them yourself using the same exacting quality control tests as our own production laboratories to measure their technical specification and superb labelling efficiency.

BIOCELL Gold Conjugates are provided as affinity purified immunoglobulins, high quality Protein A, Protein G and Streptavidin irreversibly adsorbed to 5, 10, 15 or 20nm gold particles. ALL BIOCELL Gold Conjugates can be frozen for lengthy stability and storage. With every conjugate you'll also get a detailed instruction book to help achieve superb results in your immunolabelling.

The best for:

- Electron Microscopy
- Light Microscopy
- Cell Biology
- Biochemistry

We Just Launched a New Monoclonal Antibody Against: Multi-Drug Resistence Related P-Glycoprotein (JSB-1)

This newly generated monoclonal antibody MONOSAN® (MDR) JSB-1 recognizes a strongly conserved epitope of P-glycoprotein present on both human and animal multi drug-resistant tumor cells. The antibody has been selected for optimal performance in immunocytological and immunohistological staining techniques. MDR/JSB-1 reacts to air-dried or acetone-fixed cytospins and cryostat tissue sections.

MDR/JSB-1 staining of cyto-/histological tumor specimens may contribute to customizing individual cancer therapies by predicting cytostatic drug (un-) responsiveness

Monosan monoclonal antibody against MDR Related P-glycoprotein (JSB-1) cat.no. MON 9011

For research use only. Not for use in clinical Diagnostic procedures

Genomic footprinting with *Taq* polymerase

H. P. Saluz and J. P. Jost

The linear amplification of chemically sequenced DNA with DNA polymerase from *Thermus aquaticus* permits the direct detection of DNA methylation and protein–DNA interaction sites *in vivo*.

DNA methylation and protein–DNA interactions play a crucial role in gene regulation[1,2]. Genomic sequencing — pioneered by Church and Gilbert[3], and further refined in our laboratory[4] — enables the study of the methylation state of any gene in a strand- and sequence-specific manner.

When used to investigate areas of protein/DNA interaction, the technique is referred to as genomic footprinting. In this technique, cells in suspension are treated with dimethylsulphate (DMS) or ultraviolet light to modify specific DNA bases, which undergo a quantitative cleavage reaction (β-elimination)[5–7]. The modified sites are then identified by genomic sequencing. Proteins bound to DNA protect these areas from modification by DMS and subsequent chemical cleavage, leaving their "footprint" on the DNA. In contrast, ultraviolet light cleaves at sites of protein–DNA interaction.

Despite the potential of *in vivo* footprinting for revealing protein–DNA interactions and genomic sequencing for detecting modifications to the DNA's native state, the current procedure is rather time-consuming and complex. We sought therefore to simplify the technique and make it more accessible to less experienced users[8]. A flow diagram of our new method is shown in Fig. 1*a*.

Abbreviated strategy

The first steps of both the old method and our new technique are the same: total genomic DNA is digested with a suitable restriction enzyme, and the resulting DNA fragments are chemically sequenced as described by Maxam and Gilbert[9], Fritzsche *et al.*[10], or Rubin and Schmid[11]. But in our technique, sequencing is followed by selective, linear amplification with the thermostable DNA polymerase from *Thermus aquaticus*, using a synthetic primer labelled to a very high specific radioactivity. The products of the linear amplification (Fig. 2) are then run on a sequencing gel, and the sequence information is directly obtained by exposing the dried gel to an X-ray film.

A step forward

The new technique permits sequence information to be gathered for any gene, regardless of its copy number and the size of the total genome, without electroblotting or hybridization steps (Fig. 1 *b*). Moreover, as restriction enzymes are used only to reduce the viscosity of the genomic

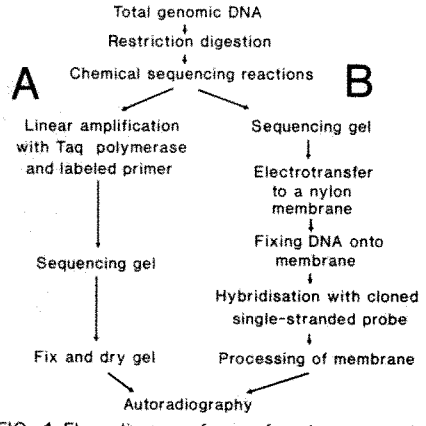

FIG. 1 Flow diagram for performing genomic experiments using the new expedited procedure (*a*), and the classical method of genomic sequencing (*b*).

DNA in the reaction mixture, less expensive endonucleases can be used, as long as they do not cleave within the target sequence.

But the success of our technique is highly dependent upon the purity of the *Taq* polymerase used, which can vary from batch to batch. The recent commercial availability of recombinant *Taq* polymerase should eliminate this problem. [Editor's note: Recombinantly produced *Taq* polymerase can be purchased from Perkin-Elmer Cetus and United States Biochemical Corporation. Purified natural *Taq* is sold by Perkin-Elmer Cetus, Stratagene, BRL, Beckman Instruments, and Promega.]

Our simplified procedure for studying the native state of genomic DNA relies on the linear amplification of cleaved DNA

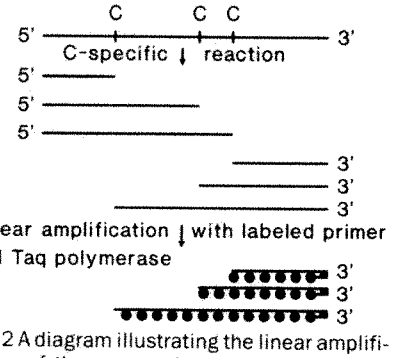

FIG. 2 A diagram illustrating the linear amplification of the sequencing reaction products. Restriction enzyme-digested DNA is first subjected to chemical sequencing reactions. The fragments generated by β-elimination are then annealed to labelled oligonucleotide primers (black squares), and the complementary strand (dotted line) is synthesized by *Taq* polymerase.

fragments to produce many radioactively labelled copies. The resulting increase in sensitivity allows the more rapid detection of single-copy mammalian genes, and should permit the investigation of such complex genomes as those of higher plants. The technique retains all of the benefits of the original genomic sequencing procedure. The unique thermostability of *Taq* polymerase permits the optimal annealing of the primer to the denatured target template, and its faithful elongation. But so far, procedures for studying DNA methylation are still based on the detection of chemical cleavage products. 5-Methylcytosine reacts poorly with hydrazine, resulting in a lack of cleavage upon alkaline treatment. The position of the 5-methylcytosine is then revealed by a gap in the sequence ladder.

Because chemical cleavage of the DNA results in fragments of different lengths, it is only possible to amplify each fragment linearly. But if procedures were available quantitatively to deaminate 5-methylcytosine residues to produce thymidine, the modified DNA could be amplified exponentially by the popularly used symmetrical amplification procedure of the polymerase chain reaction (PCR)[12,13]. Following dideoxy sequencing, the position of the original 5-methylcytosine would be detected by the presence of an A-T pair instead of a G-C pair in the undeaminated control DNA. We are now investigating this approach, because it would speed up the procedure enormously. □

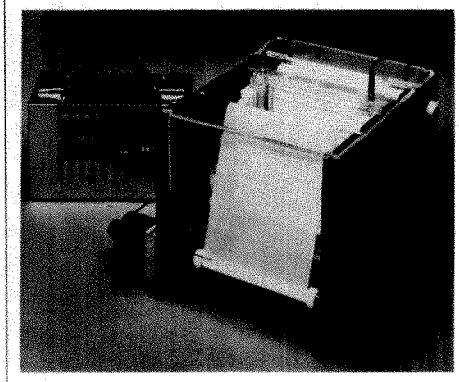
FASEB exposition in New Orleans

The best of what biology has to offer will be on display at next week's FASEB meeting in New Orleans, Louisiana — from a sponge for destaining electrophoresis gels to transgenic mice for cancer research.



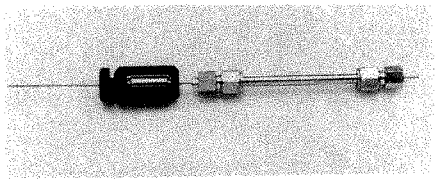
KONTRON Instruments sells an **ultracentrifuge toolkit** that contains everything needed for the correct use of Kontron ultracentifugation rotors, tubes and capping systems — packaged together in a black storage case (*Reader Service No. 101*). The toolkit includes a tube cap vise with inserts; tube, cap and adaptor removal tools; a torque wrench with sockets; a hex driver; various lubricants; and tube stands in a range of sizes. Kontron says the tools can extend the lifetime of ultracentrifuge rotors and capping systems, if used properly. The company also offers IBM-compatible centrifugal separation simulation software which allows users to predict the optimal conditions for performing a variety of separations using any standard rotor.

DuPont's transgenic OncoMouse — the world's first patented animal — is now on sale for use in cancer research (*Reader Service No. 102*). The **transgenic mouse** is reared by Charles River Laboratories, and contains the viral Harvey *ras* (v-Ha-*ras*) oncogene controlled by the mouse mammary tumour virus (MMTV) promoter. OncoMouse is intended to be used to study the pathogenesis of cancer, to screen chemopreventive and anticancer agents, and to test the carcinogenicity of compounds: 30 per cent of female mice develop breast cancer within 100 days. Both males and females develop parotid adenocarcinomas and harderian hyperplasia. DuPont also sells a line of monoclonals specific for the p21 protein product of v-Ha-*ras* for measuring oncogene expression. The price of each OncoMouse is $50 (US) for orders under 25. The company plans to offer future strains of OncoMouse incorporating rat*neu* and c-*myc* oncogenes, under the control of other types of promoters.

Gel goodies

ICN Biomedicals has introduced an **electrophoresis destaining sponge** for leaching Coomassie Brilliant Blue stains out of electrophoresis gels (*Reader Service No. 103*). ICN Biomedicals says the sponge's high affinity for Coomassie reduces by half the number of methanol rinses required for destaining. The 5 × 5 cm sponges are supplied in packs of 50. The company says one sponge is sufficient for destaining a 10 × 10 × 0.1 cm gel, with no changes in the standard destaining procedure.

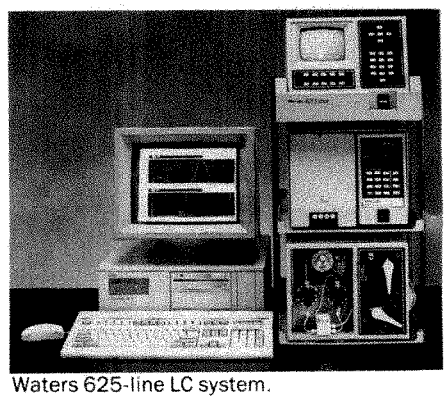
Hoefer Scientific has a new **sequencing apparatus** that separates and blots fragments in one operation (*Reader Service No. 104*). The model TE2000 direct blotting sequencer first separates fragments on a 14 × 16 cm gel. Fragments then migrate off the bottom of the gel onto a nylon membrane moving on a belt directly beneath the gel. The speed of the belt is adjustable, to eliminate the band crowding often seen at the top of sequencing gel blots. Hoefer says that the new sequencer/blotter can be used to sequence up to 400 bases in a single run, without handling fragile gels. The membrane can also be used to detect sequences by colourimetric detection, eliminating the need for working with radioactive isotopes.



Up to 400 bases-a-run: Hoefer's TE2000.

AT Biochem recently unveiled a new **electrophoresis polymer** as an alternative to agarose and polyacrylamide (*Reader Service No. 105*). The company will not disclose the composition of its Hydrolink polymer, pending approval of its patent. But AT Biochem says the Hydrolink matrix is less susceptible to breakage, produces sharper bands, is less toxic, and can accommodate ten times the loading levels of traditional gel media. The company sells formulations for both double-stranded DNA separations and sequencing gels. The Hydrolink media comes as a ready-to-pour liquid, with specially formulated buffers and denaturing reagents that eliminate the need for urea. The company plans to introduce a matrix for protein separation later this year.

Chromatographic analysers



Applied Biosystems has introduced an **amino acid analyser** that combines hydrolysis, derivatization and separation steps in one complete system (*Reader Service No. 106*). The model 420A amino acid analyser's hydrolyser unit breaks the bonds between amino acids to liberate free amino acids using hydrochloric acid at temperatures of greater than 1,000 °C. The unit completely eliminates the need for time-consuming manual hydrolysis: researchers simply add the protein sample and return in less than an hour to collect results. The 420A's PTC derivatization unit labels free amino acids with a chemical which Applied Biosystems says allows detection at high sensitivities. Once derivatized, the amino acids are separated by liquid chromatography and detected and identified by comparison with a known standard.

Hamilton has expanded its range of **reversed-phase columns** to include columns especially designed for analysis in protein and peptide matrices (*Reader Service No. 107*). Hamilton's new PRP-3 columns can be regenerated in an overnight process in order to eliminate residual protein buildup and to restore performance. The PRP-3 columns are available in pre-column, analytical and preparative sizes, and can be used over the pH range 1–12.

The Hamilton PRP-3: acid to alkiline.

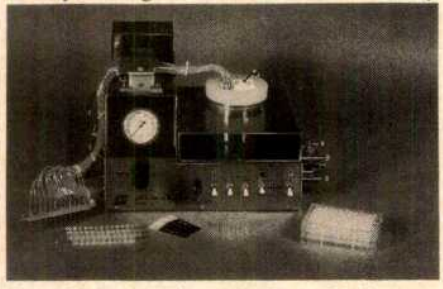
Waters recently introduced a liquid chromatography system designed specifically for bioseparations (*Reader Service No. 108*). The Waters model 625 **bioseparation chromatography system** incorporates non-metallic polymeric materials with low dispersion capabilities for microbore, analytical and micropreparative separations. The system can be used with ion exchange, affinity, hydrophobic interaction, gel filtration and reverse phase separations relevant to the biochemist, and accommodates both photodiode array and tunable UV/visible detection.

Waters 625-line LC system.

Waters says the system has a 0.01 to 5 ml min^{-1} flow range capability and a 4,000 p.s.i. operating limit. Special features include an automated plunger wash, four-buffer blending, flexible non-metallic tubing and injector, and finger-tightened fittings. The $19,000–29,500 (US) model 625 also provides Waters' PowerLine single point control of all gradient, injection, detection and external event parameters, with or without a computer.

Eldex has a new integrated, programmable **solvent delivery system** for applications ranging from microbore HPLC separations to high-resolution preparative-scale purifications (*Reader Service No. 109*). Eldex's model 9600 solvent delivery system features interactive menus for methods development without the need for programming skills. The unit will generate ternary gradients with pulse-free solvent delivery, and has input and output ports for interfacing with other chromatography peripherals. Eldex sells the instrument for $6,995 (US).

Programmable solvent delivery from Eldex.

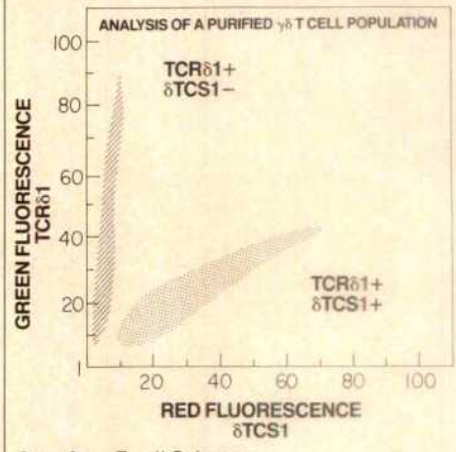


Nucleotide news

British Bio-technology Ltd sells a line of **DNA probes for interleukins** by the name of Designer Probes, after its successful line of Designer Genes (*Reader Service No. 110*). The Designer Probes recognize certain unique exons of genes coding for interleukins, and their mRNA. The probes are available for three or more exons within the genes for interleukin-1α, interleukin-1β, and interleukins 2–6. Probe cocktails consisting of an equimolar mixture of exon-specific probes are also available, to detect different regions of a gene simultaneously, yielding higher sensitivity. British Bio-technology Ltd also has a new **cytokine sampler kit** which contains trial-size samples of recombinant human cytokines interleukin-1α, -1β, -2, -3, -4, -6, and tumour necrosis factors α and β. The cytokines are produced from BBL's Designer Genes by R + D Systems in the United States. They are distributed in North and South America by R + D Systems, and in Japan by Funakoshi Pharmaceutical.

Version 5.0 of Hitachi's HIBIO DNASIS and PROSIS **sequence-manipulation software** has just been released (*Reader Service No. 111*). The new versions can perform homology searches three times faster than older releases, can create DXF-formatted output files, and can support HP Laserjet printers. DNASIS now contains two completely new analytical functions: protein coding region prediction based on Fikett's method; and secondary structure, nucleic acid sequence prediction based on Zuker's method. Restriction maps can now be displayed in circular and linear formats, together on the screen with the fragment, its size and map location. PROSIS now supports the parameter set for Rose and Roy hydrophilicity/hydrophobicity analyses, and can display Edmundson Wheel vectors of hydrophobic sites within a sequence. PROSIS and DNASIS cost $1,600 (US) each; current users can upgrade their versions for $400 (US) each.

New in immunology

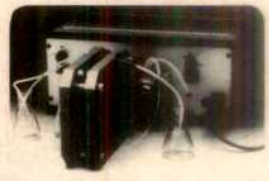


Dynatech Laboratories has a new 12-channel **dispensing system** for filling microtitre plates, slides, cards, strips and vials — the Quick Spense IIIe (*Reader Service No. 112*). Built by Sandy Spring Instruments, the Quick Spense IIIe is an automated liquid delivery system which couples time pressure dispensing with precision, cam-activated valving. Up to three reagents can be dispensed simultaneously, using 1–12 channels. Delivery volumes range from 5 μl to over 1 ml, and can be extended using an optional module. The dispensing head may be custom designed for any multiple dispensing format, and manual dispensing can be controlled by the use of the included foot switch or by the activation switch mounted on the control panel. Product contact parts can be flushed in place, or removed and autoclaved. Dynatech says the system has an accuracy rate of approximately 1.5 per cent for materials of standard viscosity.

Quick Spense IIIe for multichannel delivery.

Human **monoclonal antibody against HIV** is now available from the Swedish company BioInvent (*Reader Service No. 113*). The company develops the antibody through its patented *in vitro* immunization technology, which involves fusing peripheral lymphocytes isolated from a healthy blood donor which have been exposed to a recombinant immunodominant peptide from gp 41 to an EBV-infected hetero-myeloma. The resulting monoclonal is an IgM-kappa isotope antibody which BioInvent says has no cross-reactivity with unrelated proteins. BioInvent also offers human monoclonal antibodies specific for digoxin and cytomegalovirus.

T Cell Sciences has announced its second monoclonal antibody to the delta chain of the human T cell antigen receptor



Data from T cell Sciences.

— Identi-T TCR61 (*Reader Service No. 114*). T Cell Sciences says the **T cell antigen receptor MAb** identifies a framework

ADVERTISEMENTS

LIPOSOMES
NEW
REPRODUCIBLE — HOMOGENEOUS — EXTREMELY RAPID

Our new LIPOSOMAT guarantees rapid (5ml within 60 minutes) preparation of uniformly sized unilamellar liposomes. Liposome size is selectable between 25 and ca. 600 nm diameter. Sample volume is normally 5-10ml or up to 200ml if used in combination with an additional instrument. Lipid concentration can be up to 300 mg/ml.

Identi-T FI antibody in action.

or common determinant of the delta chain as expressed on the surface of gamma-delta positive peripheral blood lymphocytes, interleukin-2 cultured thymocytes, specific T cell lines and in tissue sections. Identi-T TCR61 is available in purified, FITC conjugated and biotinylated forms for use in immunofluorescent staining of live cells, immunochemical staining of frozen tissue sections and fixed cells, and immunoprecipitation. T Cell Sciences also sells a monoclonal specific for the alpha chain of the T cell antigen receptor. Indenti-T αF1 binds to a nonpolymorphic determinant of the alpha chain, normally hidden on viable cells but exposed on fixed cells and frozen tissue sections. It also binds to T cell antigen receptor alpha-beta heterodimers. Identi-T αF1 offers an alternative to mRNA detection for studying the ontogeny of T cells, and can be used in Western blot analyses.

The Biomek 1000 automated workstation with its robotic arm.

Beckman Instruments' Biomek 1000 **automated laboratory workstation** can be configured for receptor binding studies (*Reader Service No. 115*). The $26,500 (US) Biomek SL robotic arm can be used for loading and unloading labware onto the $24,000 (US) Biomek 1000 system. The system includes wedge-shaped stack areas which hold up to six stacks of labware — such as pipette tips, multiwell plates and tubes — within reach of the robotic arm. The workstation automatically performs pipetting, plate washing and photometry readings. For receptor binding studies, Beckman also offers 2-ml Cube 2ubes in a 96-well format, and deep-well 96-well microtitre plates with a single well capacity of 1 ml. Both Cube 2ubes and deep-well microtitre plates come sterile or unsterile, with or without covers.

GIBCO Laboratories has a new **protein-free hybridoma medium** to be used as an alternative to serum-supplemented media for monoclonal antibody production (*Reader Service No. 116*). GIBCO says its PFHM-II medium, available as powder or liquid, contains no polypeptide growth factors, attachment factors, or mediators to complicate downstream purification, and that it performs as well as serum-supplemented media in conventional and high-density culture systems.

The literature shelf

Schleicher & Schuell's new four-colour **life sciences catalogue** describes apparatus and filter media available from the company for a variety of separation techniques, transfer methods, solid phase assays and related procedures (*Reader Service No. 117*). Among the new products featured are Schleicher & Schuell's Profile mini-electrophoresis system, Elutrap electroseparation unit, and dual-filter Uniflo Plus syringe filter unit. A section devoted to transfer media describes new Optibind reinforced nitrocellulose membranes, and a new section outlines the company's services for developers of test kits and device manufacturers. The free catalogue also includes a selection guide to help users choose the appropriate product for a specific application.

The new 1989 catalogue on **cell culture reagents** from Boehringer Mannheim Biochemicals features the company's Nutridoma media supplements, cell culture factors and cytokines, antibodies to factors and cytokines, dissociating and harvesting enzymes, hybridoma reagents, antibiotics and complementary products (*Reader Service No. 118*). The free catalogue outlines the form, purity, concentration, price and other pertinent information on the full range of Boehringer Mannheim's products for cell culture.

Stratagene's new **1989 catalogue** should hit the streets this month (*Reader Service No. 119*). The company's free catalogue will outline its Stratalinker for crosslinking nucleotides to membranes, its ThermalBase kit for DNA sequencing using *Taq* polymerase, and its Zap cDNA synthesis kit for uni-directional cloning. Also described will be Stratagene's custom library preparation services, its large selection of restriction and modifying enzymes, and its Epicurean Coli high efficiency competent *Escherichia coli*.

Setting it straight

The instrument for using caged neurotransmitters described in the 9 February issue (*Nature* **337**, 583; 1989) was developed while the author was at the School of Applied and Engineering Physics, Cornell University. Jeffrey Marque is now with the Spinco Division of Beckman Instruments. The article also should have referred to work on the measurement of light-activated neurotransmitters by H. A. Lester and J. M. Norbonne (*A. Rev. biophys. Bioengng* **11**, 151–175, 1982). □

These notes are compiled by Carol Ezzell from information compiled by the manufacturers. To obtain further details, fill out the reader service card bound inside the journal. Prices quoted are sometimes nominal, and apply only within the country indicated.

CORTECH, INC.

Cortech is a Denver based research and development company in the human pharmaceutical industry. Our areas of research interest include proteases and protease inhibitors, immunology, drug receptor interaction, malignancy and immunodeficiency. We are currently seeking candidates for three positions:

PHARMACOLOGIST

Senior pharmacologist with at least two years of post-doctoral training to be involved in classical drug metabolism studies, animal modeling of human disease states and drug and metabolite development.

PEPTIDE CHEMIST

Senior biochemist with at least two years of post-doctoral training in solution and solid phase peptide synthesis, modification, purification and analysis.

RESEARCH ASSISTANTS

Research assistants are also needed in the above areas as well as protein and protease chemistry and molecular biology. Requires B.S. or M.S. in related field preferably with 1–2 years experience.

Successful applicants must be able to work independently in a multi-disciplinary research group. Cortech offers competitive salary and benefits packages including stock options. Please send resume to **Timothy C. Rodell, M.D., V.P., Operations, Cortech, Inc., 6840 No. Broadway, Ste. F., Denver, Colorado 80221.**

AN EQUAL OPPORTUNITY EMPLOYER (NW3435)A

TENURED OR TENURE-TRACK FACULTY POSITIONS

Tenured or tenure-track faculty positions are available in a newly estabilised Program in Molecular Medicine. This interdisciplinary program currently includes nine faculty research programs in complementary fields of biomedical science and occupies 40,000 square feet of research space in a newly constructed building. The Medical Center is committed to recruiting and supporting scientists of the highest quality, in an outstanding research environment. Research areas currently being expanded include:

1. ***Molecular Virology/Retroviruses***
2. ***Molecular Immunology***
3. ***Tumor Biology/Oncogenes***
4. ***Macromolecular Structure/X-ray Crystallography/NMR***
5. ***Cellular Physiology/Signal Transduction***

There is particular intetest in candidates using contemporary methodologies, e.g. transgenic animals. Applicants must have a Ph.D. or M.D. degree with demonstrated research productivity. A strong motivation toward creative research and ability to attract independent funding is essential. Faculty rank and salary are negotiable.

Applicants must submit curriculum vitae, summary of research interests and names of three references to: **Dr. Michael P. Czech, Director or Dr. John L. Sullivan, Search Committee Chairman, Program in Molecular Medicine, University of Massachusetts Medical School, 55 Lake Avenue North, Worcester, MA 01655.**

An Equal Opportunity/Affirmative Action Employer (NW3466)A

FACULTY POSITIONS
ANATOMY, CELL AND MOLECULAR BIOLOGY AND RETROVIROLOGY

The Department of Anatomy and Cell Biology, SUNY Health Science Center at Brooklyn, NY, invites applications for several faculty positions, at all ranks, in an actively growing department committed to expanding its faculty in the general area of molecular, cellular and neuro biology. One of these positions is specifically for the directorship of a core facility in structural biology equipped with a Tracor-Northern digital image analysis system. Other positions will require teaching in our medical school gross anatomy or histology/cell biology or neuroanatomy course and participation in graduate school core curriculum. We require a M.D. or Ph.D. degree with postdoctoral experience and demonstrated ability to develop an independent research program. Candidates with research interests in the area of human retroviruses, mechanisms of tissue specific gene expression, molecular biology of muscle development, cell surface and membrane channels or signal transduction mechanisms, are particularly encouraged to apply. Excellent laboratory facilities, start-up funds and infra-structural support and excellent environment for collaboration among basic and clinical investigators are available for modern biological work. Send Curriculum Vitae, a statement of research goals and the names of three references to:

Dr. M.A.O. Siddiqui
Professor and Chairman
Department Anatomy & Cell Biology
SUNY Health Science Center at Brooklyn

UNIVERSITE D'OTTAWA, Département de Biochimie

Le Département de Biochimie est à la recherche de **trois professeurs adjoints** avec possibilité de permanance pour entrer en fonction le 1er septembre, 1989. La disponibilité des postes est soumise à l'approbation budgétaire. Un doctorat est de rigueur. Les candidat(e)s choisi(e)s devront enseigner la biochimie et en français et an anglais au niveau pré-diplomé. Ils (elles) seront tenus(e)s d'entreprendre des programmes de recherche indépendante y compris la formation de candidats aux grades supérieurs. L'Université a une politique d'égalité en matière d'emploi. Les citoyen(ne)s canadien(ne)s ou résident(e)s permanent(e)s reçu(e)s sont invité(e)s à poser leur candidature en s'addressant au **Dr. P. Anderson, Département de Biochimie, Université d'Ottawa, Ottawa, Ontario, Canada K1H 8M5.**

UNIVERSITY OF OTTAWA, Department of Biochemistry

Applications are invited for **three assistant professor positions**, with the possibility of tenure. The positions are subject to budgetary approval and would begin Sept. 1, 1989. Ph.D. and evidence of research potential required. Candidates must be able to teach in English and French at the undergraduate level and be prepared to develop an independent research program including graduate student supervision. Employment equity is University policy. Canadian citizens and permanent residents of Canada are invited to apply to **Dr. P. Anderson, Department of Biochemistry, University of Ottawa, Ottawa, Ontario, Canada K1H 8M5.**

(NW3467)A

Unusually Challenging Opportunity in Molecular Graphics and Computational Chemistry

Smith Kline & French has an international reputation for scientific excellence and innovation in the research and development of ethical pharmaceuticals.

We are looking for an outstanding individual to direct our Molecular Graphics and Computational Chemistry Group within Medicinal Chemistry. The group is involved in both the development and application of computational and graphical techniques to problems in medicinal chemistry and other disciplines involved in drug discovery. Current research will require versatile solutions to challenging problems in both small molecule and protein modelling.

Both SK&F developed software (COSMIC/ASTRAL) and a wide range of standard packages, including SYBYL, are currently in use. In-house access to the Cambridge and Brookhaven data bases and various reaction and sequence data bases is also available.

As leader, you will be responsible for developing and promoting this core technology and enhancing the reputation of the group within the company and externally. Effective liaison with Programme and Feasibility Study Teams and the Computer Science Department will be key to ensuring that appropriate use is made of computational techniques.

As a candidate for this post, you will have a strong background in computer graphics and either physical organic or medicinal chemistry. With several years experience within a similar group, you will already have an established reputation in this field. You will be able to demonstrate an ability to develop appropriate software and successfully apply computational techniques to drug design. We will also be looking for evidence of your ability to inspire researchers in other disciplines to explore the potential of these techniques.

A competitive salary will be offered, and benefits will include a company car, performance-related bonus, BUPA and relocation expenses where appropriate.

Please write in confidence, enclosing a detailed CV and quoting reference no 33/89. to: Dr. T. R. Hutton, Personnel Manager, Smith Kline & French Research Limited., The Frythe, Welwyn, Hertfordshire AL6 9AR.

SK&F Leaders in pharmaceutical research and development worldwide (8747)A

University of Birmingham
School of Basic Medical Sciences
Lectureship in Physiology

A vacancy exists for a lecturer with an established research record in cardiovascular physiology. We are seeking a scientist with a special interest in cardiac and vascular factors limiting performance but persons with expertise in other areas of cardiovascular physiology are encouraged to apply.

The main research areas in the Department are: cardiovascular control, neurophysiology of motor and sensory system, cellular neurophysiology and renal physiology.

The Department is responsible for teaching physiology to medical, dental and science students.

Salary in the range £9,260-£19,310 per annum, plus superannuation.

Informal enquiries can be made to Professor J.H. Coote, Department of Physiology, The Medical School, University of Birmingham, Birmingham B15 2TJ (Tel. 021-414-6915/6).

Further particulars and application forms may be obtained from the **Senior Assistant Registrar, University of Birmingham Medical School, Vincent Drive, Birmingham B15 2TJ (Tel. 021-414-4049)** to whom applications, including c.v. and the names and addresses of three referees, should be sent by not later than April 10th 1989.

AN EQUAL OPPORTUNITIES EMPLOYER (8759)A

DEPARTMENT OF VISUAL SCIENCE,
Institute of Ophthalmology,
Judd Street,
London, WC1H 9QS

Senior Lecturer/Lecturer

Candidates with a proven record in research in visual neurobiology, visual psychophysics or scientific topics relevant to investigative ophthalmology will be considered. The Department has a rapidly expanding externally funded research programme and with recent new appointments to staff, provides an ideal environment for those wishing to develop an independent career in vision research in the UK. The starting date is negotiable. Salary within the scale £15,105–£19,310 or £20,270–£22,910 p.a. plus £1,650 London Allowance.

Postdoctoral Research Fellow

We have two vacancies for candidates with an interest in pursuing a career in visual neurobiology. One project involves in vitro intracellular recording techniques and is concerned with excitatory amino acid receptors in visual transmission, but will also provide opportunity for in vivo work on the same system. This is funded for five years. The other, funded for two years in the first instance, is to support either anatomical or electrophysiological studies on feedforward and feedback projections in the central visual system. The starting date is 1st Oct 1989 or sooner if appropriate. Salary will be in the range £9,865–£14,500 p.a. according to age and experience, plus £1,650 London Allowance.

Applicants should send a full curriculum vitae with names of two referees to Professor A.M. Sillito at the address above from whom further details can be obtained (01–387–9621 x258) (8743)A

Director
Human Studies Division

Health Effects
Research Laboratory
Research Triangle Park, NC

U.S. Environmental Protection Agency

An Equal Opportunity Employer

The U.S. Environmental Protection Agency (EPA) is seeking candidates for the position of Director, Human Studies Division, Health Effects Research Laboratory (HERL). This position is located in Research Triangle Park, N.C. and is a permanent full-time position with a salary range of $57,158 to $74,303 per annum commensurate with qualifications. Additional salary incentives are available should a physician be selected for this position.

*HERL has a staff of about 300, over 100 of whom hold doctoral level degrees. The Laboratory has a diverse program which includes **in vitro**, animal, human, clinical, and epidemiological research designed to address issues related to the health effects of air and water chemical and biological pollutants.*

The Human Studies Division (HSD) is a multi-disciplinary program organized into two branches: Clinical Research and Epidemiology with a combined EPA staff of 35, with approximately 75 on-site contractor personnel. The Division is a focal point for planning, conducting, coordinating, supporting and evaluating a program of clinical and epidemiological investigations to improve the understanding of human health risks associated with environmental pollution. The program includes both intramural investigations and extramural arrangements with universities, industry, private research institutions and other government agencies. The primary responsibilities of the Director are to direct and manage the program. This includes developing the program to meet the evolving needs of EPA, presenting the program, developing and managing budgets, supervising the staff, directing the progress of the program and ensuring the scientific quality and productivity of the program.

The preferred candidate for this position would possess the following qualifications:

1. Advanced degree in a biological or medical discipline or epidemiology with at least six years of professional experience in any of these areas. Applicable graduate coursework may be substituted for a portion of the preferred experience.

2. Experience as a supervisor of a scientific/professional staff.

3. Recognized scientific expertise as evidenced by multiple publications in peer-reviewed literature and invitations to participate in national and international meetings/panels.

4. Proven ability to provide leadership in directing the development and progress of a creative and effective multidisciplinary human research program.

5. U.S. citizenship is required.

*Forward curriculum vitae and names of three references prior to May 1 (previously April 17) 1989 to: **Dr. Lawrence W. Reiter, c/o Terri Burrell, HRMD (MD-29), U.S. Environmental Protection Agency, Research Triangle Park, NC 27711.***

(NW3408)A

UNIVERSITY OF
essex

OXIDATIVE DEGRADATION OF GLYCATED PROTEINS

Department of Chemistry and Biological Chemistry

Applications are invited for the position of Senior Research Officer to work on the **oxidative degradation of glycated proteins** with Drs Paul Thornalley and Michael Wilson. The formation and oxidative degradation of glycated proteins to advanced glycosylation end-products (AGE compounds) has been implicated in the development of diabetic complications. The project involves studying the kinetics and mechanism of oxidative degradation of model glycated aminoacids, glycated proteins, and finally a search for AGE compounds in plasma from diabetic patients. Applicants should have a PhD or shortly expect to gain one in chemistry, biochemistry or a related subject, and ideally have interests in the biochemistry of hyperglycaemia, especially non-enzymatic protein glycation.

The successful applicant can expect to join a lively and enthusiastic group and enjoy working in a multi-disciplinary life sciences laboratory. The post is funded by the Medical Research Council for three years with salary on the research assistant Grade IA scale (£9,865 - £15,720).

Informal enquiries may be made to Paul Thornalley (Tel. 0206 873010 direct dial) and further particulars can be obtained from the Personnel Office (Tel. 0206 873433).

Applications (three copies), including a curriculum vitae and the names and addresses of two referees, should reach the Registrar (R/851/N), University of Essex, Wivenhoe Park, Colchester CO4 3SQ by 31st March 1989.

(8702)A

EXECUTIVE DIRECTOR

The International Association for Dental Research (IADR) and the American Association for Dental Research (AADR) are seeking an Executive Director, effective July 1, 1990.

The Associations represent the worldwide dental research community with more than 8,000 dental scientists and have joint headquarters in Washington, D.C. USA. The Executive Director is responsible for coordinating the fiscal, administrative, publishing, and conference activities of the two Associations, with a staff of ten. The Executive Director is also responsible for initiating and promoting the interests of dental research worldwide.

Candidates should be qualified to conduct the affairs of a major scientific society. In addition to leadership ability, this involves extensive interaction with members, with other Associations, and with U.S. and other national and international agencies.

Applications and nominations including resume should be received by August 1, 1989, although the search will remain open until the position is filled.

The IADR/AADR is an equal opportunity employer.

Seven copies of the application, and any inquiry or nomination, should be sent to:

Dr. Gordon Rovelstad, Chairman
Search Committee for Executive Director of IADR/AADR
1111 14th Street, N.W., Suite 1000
Washington, DC 20005
USA

(NW3443)A

UEA
NORWICH

Lectureships in School of Environmental Sciences

Applications are invited for the following posts in this large and successful interdisciplinary School, which the University plans to fill from 1 August 1989 or as soon possible thereafter under the terms of the New Academic Appointments Scheme.

1) Lecturer in Hydrogeology
(Hydrology/Geomorphology)

2) Lecturer in Environmental Economics

Applicants should have research interests in the area of the relevant post. Preference will be given to those at an early stage of their careers. The salary will be at an appropriate point on the Lecturer Grade A scale (£9,260-£14,500 per annum, under review).

Applications (three copies) which should include a full curriculum vitae with exact date of birth, together with the names and address of three persons to whom reference may be made, should be lodged with the **Administrative Secretary, University of East Anglia, Norwich, NR4 7TJ (telephone 0603 592734)** from whom further particulars may be obtained, not later than 29 March 1989.

UEA is an equal opportunities employer

(8711)A

THE UNIVERSITY OF LEEDS
DEPARTMENT OF EARTH SCIENCES

RESEARCH ASSISTANT/FELLOW

Applications are invited for the above post available from 1 May 1989 for a fixed period of two years for work on geophysical research involving the use of data acquisition and processing techniques.

A good honours degree in Geophysics or Physics and further qualifications/experience in programming, especially in FORTRAN an advantage.

Salary for Predoctoral Research Assistant on R/A Grade IB (£8,675-£11,680) or, for Postdoctoral Research Fellow, on R/A Grade IA (£9,865-£15,720) according to qualifications and relevant experience. Candidates for Research Fellow should have a PhD or equivalent experience.

Informal enquiries may be made to Dr K A Whaler (tel (0532) 335216).

Application forms and further particulars may be obtained from, and completed applications forwarded to the **Registrar, The University, Leeds LS2 9JT, (tel. (0532) 333963 — direct line)**, quoting reference no. 49/37. Closing date for applications — 10 April 1989. (8719)A

Conseil de recherches en sciences naturelles et en génie du Canada
Natural Sciences and Engineering Research Council of Canada

RÉPERTOIRE DES CANADIENS ÉTUDIANT À L'ÉTRANGER

Le Conseil de recherches en sciences naturelles et en génie du Canada (CRSNG) a récemment mis sur pied un répertoire des Canadiens qui poursuivent des études supérieures ou effectuent un stage postdoctoral en sciences naturelles et en génie dans des universités ou des établissements étrangers. Le but de ce répertoire est de faciliter leur retour au Canada en offrant un moyen de communication avec d'éventuels employeurs canadiens.

Admissibilité : les citoyens canadiens et les résidents permanents du Canada qui poursuivent des études supérieures ou qui effectuent un stage postdoctoral dans une université ou un organisme à l'extérieur du Canada dans le domaine des sciences naturelles ou du génie peuvent être inscrits au répertoire.

Fonctionnement : conjointement avec le répertoire, le CRSNG tiendra un registre d'employeurs canadiens éventuels dans les secteurs universitaire, industriel et gouvernemental. Sur demande, un employeur recevra une liste des Canadiens inscrits possédant les compétences spécifiques qu'il aura pré-déterminées.

Le CRSNG établira le contact initial entre les étudiants et les employeurs éventuels; ces derniers seront responsables de toutes communications subséquentes. Ce service est offert gratuitement aux étudiants inscrits et aux employeurs éventuels.

Inscription : les étudiants et boursiers canadiens qui désirent obtenir de plus amples renseignements ou des formules d'inscription doivent communiquer avec :

L'Administratrice du Répertoire des Canadiens étudiant à l'étranger
Conseil de recherches en sciences naturelles et en génie du Canada

GLASGOW UNIVERSITY
Chemistry Department

POSTDOCTORAL RESEARCH ASSISTANT

The post, funded by SERC, involves novel studies of stereochemistry and magnetic structure in a range of organic, inorganic and biological molecules using a multichannel Raman optical activity instrument. Applicants should have a background in chemical physics.

The appointment will be made on an annual basis, renewable for up to three years, starting on 1st August 1989 or on an agreed date up to six months thereafter. Salary is within the 1A Range for Research and Analogous Staff (£10,460-£11,680, plus USS).

Applicants should write directly to **Professor L. D. Barron (Chemistry Department, the University, Glasgow G12 8QQ)** enclosing a C.V. and the names and addresses of two academic referees. (8748)A

UNIVERSITY OF BIRMINGHAM

LECTURER

in the Medical Science School attached to the Department of Immunology

Applications are invited from established research scientists in the field of molecular immunology with a particular interest in the regulation of gene expression during the development, differentiation and activation of leucocytes. The holder of this post will be expected to form his or her own research group which will be largely self funded by external grants. The successful candidate will be chosen for their potential for interaction with other research groups working on leucocyte physiology and pathology in the University. These include Professor J J T Owen, T cell development; Professor I C M MacLennan, B cell physiology; Professor A B Rickinson, viral oncogenesis of B cells; Dr G Brown, regulation of granulocyte and macrophage development and Professor R Michell, intracellular transduction pathways in leucocytes. An important level of cross collaboration already exists between these groups which are respectively located in the Departments of Anatomy, Immunology, Cancer Studies, Immunology and Biochemistry. The appointee will be expected to participate in undergraduate and postgraduate teaching in the field of immunology and molecular genetics.

Salary in the range £9,260-19,310 p.a. plus superannuation.

Further particulars and application forms may be obtained from the **Senior Assistant Registrar, University of Birmingham Medical School, Vincent Drive B15 2TJ (Tel: 021-414-4049)** to whom application forms including CV and the name of three referees should be sent by not later than 28th April 1989.

AN EQUAL OPPORTUNITY EMPLOYER (8764)A

HATFIELD POLYTECHNIC

SCHOOL OF NATURAL SCIENCES

L/SL PLANT GENETICS
(REF. 892)

L/SL LANDSCAPE ARCHITECT/PLANNER
(REF. 893)
SALARY: LECTURER £8,814-£15,702/SENIOR LECTURER £15,702-£18,882

Following the establishment in 1988 of a degree in horticulture in collaboration with Writtle College, these two full-time appointments are available from 1 September 1989 in the Polytechnic.

The plant Geneticist will be based in the Division of Biological Sciences and will be expected to teach plant breeding methods, cytogenetics and basic biochemistry to students of horticulture and applied biology. Applicants should have either postgraduate or postdoctoral experience, preferably in commercial horticulture and will be expected to pursue relevant research and participate in short courses and consultancy..

Informal enquiries may be directed to Dr I Simkins (07072 79552).

The Landscape Architect/Planner will be based in the Division of Environmental and Earth Sciences and will be expected to teach landscape studies (historical development, policy, management and design) and environmental planning (development control and the planning process). Applicants will be expected to actively pursue research in a relevant area and to participate in course design and administration, short courses and consultancy.

Informal enquiries may be directed to Dr K Bardon (07072) 79516.

L/SL MICROBIAL MOLECULAR GENETICS
(REF. 894)
SALARY: LECTURER £8,814-£15,702/SENIOR LECTURER £15,702-£18,882

Applications are invited from postdoctorates in microbial molecular genetics. The successful candidate will be expected to contribute to teaching and development of genetics and molecular biology in undergraduate, postgraduate and short courses and to carry out research in some aspect of molecular biology. Experience with yeast systems would be an advantage but not essential. Informal telephone enquiries may be addressed to Mr P F Stanbury (07072) 79550. The appointment is available immediately.

Closing date for all the above posts 7 April 1989.

Further details and application forms may be obtained from the Personnel Department, Hatfield Polytechnic, College Lane, Hatfield, Herts AL10 9AB or telephone Hatfield (07072) 79802.

Please quote appropriate reference number when applying.

(8767)A

POSTDOCTORAL OPPORTUNITIES

Howard Hughes Medical Institute, a leading medical research organization, has postdoctoral positions available to study the structure-function relationships of blood clotting proteins or cellular regulation of receptor expression.

You will work in a new facility with monoclonal, tissue culture and structural biology core facilities. Experience in molecular or cell biology, or protein or physical chemistry is preferred.

To apply, send C.V. and two recommendations to: **Charles T. Esmon, PhD, Howard Hughes Medical Institute, c/o Oklahoma Medical Research Foundation, 825 NE 13, Oklahoma City, OK 73104. EOE.** (NW3441)A

Immediate position for
POSTDOCTORAL FELLOW
(M.D. or Ph.D.)
interested in gene transfer and gene therapy. Ongoing project in molecular and cellular biology transferring human globin genes in retroviral vectors into mice. Previous experience in molecular biology preferred.

Send résumé to: **Dr. Arthur Bank, Columbia University, HHSC 1602, 701 West 168th Street, New York, NY 10032.** (NW3450)A

UNIVERSITY OF EDINBURGH
FACULTY OF MEDICI
DEPARTMENT OF ANATOMY

TWO LECTURESHI (NON-CLINICAL) I HUMAN ANATOM

Applications are invited for two tureships in the Department of A omy for which the University sought funding under the UGC's academic appointments sch with effect from October 1989. U the terms of this scheme, whic intended to provide perma appointments for young staff, pr ence will be given to candidates *early stage in their careers.* The ir iduals appointed should ideall clinically qualified with some ex ience in the teaching of Topogra cal Anatomy. Candidates should ferably also be familiar with the te ing of Histology, Neuroanatomy Embryology, and be actively invol in anatomically oriented/clinic relevant research. Medically or sc tifically qualified candidates witho PhD or equivalent will be conside as staff in post are encouragec study for a higher degree or diplor

Salary will be at an appropriate p on the Lecturer scale AI2A (prese maximum £14,500 per annum) v superannuation under the Unive ties Superannuation Scheme.

Further particulars may be obtai from the Personnel Office, Univer of Edinburgh, 63 South Bridge, Ec burgh EHL 1LS.

Applications by letter (6 copies), cluding c.v. and names and addres of two referees should be sent **Professor M.H. Kaufman, Univers Medical School, Teviot Place, Ed burgh EH8 9AG,** not later than 1 April 1989. Please quote referer NAAS2002. (8721)A

POSTDOCTORAL/RESEARCH ASSOCIATES

THEORETICAL/ COMPUTATIONAL CHEMISTR

EXPERIMENTAL FEMTOSECON SPECTROSCOPY

Molecular dynamics of chemica reactions in solution, includin enzyme and other catalyze reactions. Comparison amon molecular dynamics calcula tions, analytical theories an experimental measurements.

Prof. Kent R. Wilson, Department of Chemistry B-039 University of California, San Diego, La Jolla CA 92093.

Affirmative Action/Equal Oppor tunity Employer. (NW3189)A

Where is the university graduate (m/f) who takes the responsibility for the research strategy of the future as Head of Section, Pharmacology?

Duphar B.V. is a medium-sized internationally orientated company with a range of ethical pharmaceuticals originating from its own research and development.

Duphar reinvests a large proportion of its turnover in R & D. Major areas of research are in the central nervous, vascular and circulatory systems.

The R & D facility is situated in pleasant surroundings, sixteen kilometers from Amsterdam.

Duphar's Pharmacology Department (about 75 staff) is housed in well-equiped new laboratories. Due to an internal promotion this department has a vacancy for a head of vascular and circulatory pharmacology.

This important managerial position offers an excellent opportunity to participate in steering the future research strategy in the vascular and circulatory field. You will manage a multidisciplinary team of seven PhD's, about 25 competent technicians and 3 research assistants. The research field includes atherosclerosis, ischemia, fibrinolysis and migraine.

The successful candidate for this position will have a PhD and broad knowledge of vascular and circulatory pharmacology. Through a proven record of publications he or she must demonstrate his/her ability to think creatively in a research environment.

The candidate should be able to interact with our chemists as well as our clinicians. The candidate must have significant management experience and be able to integrate the multidisciplinary team. Experience within the pharmaceutical industry is essential for this important position.

For further information please call Dr A. de Jonge, Director of Pharmacology, 312940-79633. Applications including C.V. should be sent to Mr J.W. Rengelink, Personnel Department, Duphar B.V., P.O. Box 2, 1380 AA Weesp, The Netherlands, mentioning vacancy number 4251.

PENNSTATE

The Pennsylvania State University
College of Medicine

NEUROSCIENCE RESEARCH IN ANESTHESIA

The Department of Anesthesia of The Pennsylvania State University College of Medicine and the University Hospital of The Milton S. Hershey Medical Center is inviting applications for a research faculty position to begin in the Summer or Fall of 1989. The Department presently has four areas of concentration in research related to physiology and pharmacology of the anesthestic state: including cardiovascular, pulmonary, neurophysiological and neuropharmacological areas. We are seeking candidates with a Ph.D. or M.D. qualification with substantial post doctoral experience in one or more of the following areas: mechanisms of drug action, neurotransmitters, membrane receptors, signal transduction, ion-channels, and mechanisms of consciousness. We are particularly interested in candidates who are able to relate their research to the questions of mechanisms of pain and anesthesia. Significant research accomplishment and demonstrated ability to obtain independent funding are essential. Excellent opportunities exist for research collaboration and a joint appointment in a basic science department and participation in the Neuroscience Program.

Applicants should submit, prior to May 1, 1989, curiculum vitae, reprints, statement of current and planned research interests, and names of at least three references to:

Julien F. Biebuyck, M.B., D.Phil.
Eric A. Walker, Professor and Chairman
Department of Anesthesia

Equal Opportunity/Affirmative Action Employer (NW3429)A

FACULTY POSITION IN MOLECULAR DEVELOPMENTAL GENETICS

RESEARCH ASSISTANT PROFESSOR

Center for Inherited Diseases
University of Washington

The University of Washington School of Medicine seeks applications for a Research Assistant Professor position in the Division of Medical Genetics and the Center for Inherited Diseases. We are particularly interested in identifying molecular biologists who wish to pursue research initiatives in molecular developmental genetics. The successful applicant will participate as a coinvestigator in a research program focused on the analysis of molecular control of globin gene switching and will also be expected to develop an independent research program on some aspect of molecular developmental genetics.

Funding is available for three years. Candidates should forward a curriculum vitae, three letters of reference, and a statement of research interests to **Dr. George Stamatoyannopoulos, Division of Medical Genetics, RG-25, University of Washington, Seattle, WA 98195.** Deadline for applications is May 15, 1989. *The University of Washington is an Equal Opportunity/Affirmative Action Employer.*

(NW3433)A

RESEARCH SCIENTISTS MAMMALIAN CELL GENE EXPRESSION

Amgen, an industry leader in applied biotechnology, has an immediate need for 2 Research Scientists to contribute to our research programs in mammalian cell gene expression.

RESEARCH SCIENTIST CELLULAR PHYSIOLOGY

Dept. #347

This position requires a Ph.D. in mammalian cellular physiology and/or somatic cell genetics as well as a minimum of 2 years' postdoctoral experience in growth regulation and differentiation of animal cells. Familiarity with culturing various primary and established cell lines as well as experience in cloning and sorting cells and selecting metabolic and drug resistant mutants are essential. Some understanding and experience in cell culture scale-up are desirable.

RESEARCH SCIENTIST GENE REGULATION

Dept. #348

Qualified candidates for this position will have a Ph.D. and a minimum of 2 years' postdoctoral experience in eukaryotic post-transcriptional gene regulation, including protein processing and secretion. Familiarity with glycosylation pathways and signal transport at the molecular level is essential.

Amgen offers an exciting and challenging research environment as well as an excellent compensation and benefits package including equity offerings. Qualified applicants should send a c.v. including references, in confidence, to:

AMGEN, INC.
Recruitment, Specify Dept. #
1900 Oak Terrace Lane
Thousand Oaks
CA 91320 (NW3432)A

Equal Opportunity Employer

AMGEN

NATIONAL INSTITUTES OF HEALTH
IMMUNOLOGIST/ CELL BIOLOGIST

Experience in immunology, cell biology and molecular biology to study the role of human $CD5^+$ B lymphocytes in the normal and autoimmune repertoire and to make human monoclonal antibodies. The candidate should have at least two years postdoctoral experience. The initial appointment will be for two years, with renewals on a yearly basis. Starting salary range, depending on experience, is $30,000 to $50,000 per year. The position is available immediately. Send Curriculum Vitae and names of references to **Dr. Lois Salzman, Deputy Director Intramural Research Program, National Institute of Dental Research, National Institutes of Health, 9000 Rockville Pike, Building 30, Room 121, Bethesda, Maryland 20892.** NIH is an Equal Opportunity Employer.

EG&G BIOMOLECULAR™

OPPORTUNITY IN AUTOMATED DNA SEQUENCING INSTRUMENTATION

EG&G BIOMOLECULAR, a leading US supplier of automated DNA Sequencing Instrumentation is expanding its European activities.

EG&G BIOMOLECULAR is a division of **EG&G**, a Boston-based FORTUNE 500 company with a 40-year tradition of leadership in science and technology.

To support our distribution organizations in Europe we are looking for the

EUROPEAN APPLICATIONS AND PRODUCT SPECIALIST DNA SEQUENCING

based in our European Distribution Headquarters in Munich, West Germany.

You will provide application advice to customers and technical support to our sales engineers throughout Europe, develop and conduct training programmes for our automated DNA sequencer, and attend seminars and exhibitions. You will work closely with customers and scientific advisors to identify new product opportunities and monitor market trends. The close contact with our sales organizations and the cooperation with our marketing department in the US will require extensive travel within Europe and the USA.

- ★ *Do you enjoy working in a team and a people-oriented environment? Is your participation in starting this new busines exciting you?*
- ★ *We offer an attractive salary augmented by a performance related bonus scheme as well as the benefit of a company car.*
- ★ *You will have a degree in advanced life science, experiencing in DNA sequencing, and working experience in a molecular biology laboratory.*

Become part of **EG&G**. Send your resume and photograph to

BTG
British Technology Group

BTG is the largest and most successful technology transfer organisation in the world – it promotes the development of new technology into commercial products.

BTG's Pharmaceuticals Division has a major involvement in the development and licensing of innovative pharmaceuticals and biologicals for human and veterinary use and we are now seeking two Executives to join an existing professional multi-disciplinary team.

Cancer Specialist

Three years ago BTG launched a major initiative to encourage research into the development of new agents for the diagnosis and treatment of cancer. We now require a scientist with broad based experience in the field of cancer to manage the existing programmes and to initiate new lines of product orientated research.

Pharmaceutical Scientist

For the second post we are seeking a person with a research background and knowledge of drug discovery and development. The successful candidate will be expected to identify and evaluate new therapeutic opportunities in a broad area of medical research.

FOR BOTH POSTS responsibilities will include liaising with research laboratories primarily in the UK academic sector, and setting up and managing BTG-funded development projects. The overall aim is to expand BTG's portfolio of inventions for patenting and licensing to industry worldwide. Responsibilities will also include selecting licensees for particular inventions. The posts are based in London but considerable travel is involved.

Applicants aged 30+ should preferably possess a higher degree, but the subject is of less importance than post-graduate experience. A period in pharmaceuticals is desirable for the first post and essential for the second, ideally involving drug development.

Major company benefits include relocation assistance if appropriate.

For an informal discussion telephone 01-403 6666 Ext. 2525. Otherwise contact the Personnel Manager for an application form or send CV, including salary, to her at: British Technology Group, 101 Newington Causeway, London SE1 6BU. Telephone 01-403 6666.

(8766)A

DEPARTMENT OF GEOLOGICAL SCIENCES

Lecturer in Geology

– PLYMOUTH CAMPUS

Salary: Within the range £8,481 to £15,369 (starting point dependent on experience and qualifications) – normally with further advancement to £18,549 per annum.

Applications are invited from suitably qualified geologists to join a strong and very active department. Candidates will be expected to teach on the BSc Applied Geology degree and take a leading role in the geological components of the BSc Environmental Science degree. The successful candidate is likely to have a substantial research record and will have either worked in industry or have experience of professional practice. To balance our present expertise, applications are particularly sought from the fields of hydrogeology, industrial minerals, micropalaeontology, remote sensing or mathematical geology.

Application forms, to be returned by Friday 31 March 1989, and further details are available from the Personnel Department at the address below, or by telephoning (0752) 264639.

Plymouth Polytechnic (8710)A

Drake Circus, Plymouth, Devon PL4 8AA

AN EQUAL OPPORTUNITIES EMPLOYER

UNIVERSITY OF BRISTOL
DEPARTMENT OF PATHOLOGY

Applications are invited for the post of **RESEARCH ASSISTANT** for one year in the first instance. The project concerned is funded by the Cancer Research Campaign to carry out DNA analysis on extracts of Sternberg-Reed cells from Hodgkin's lymphoma.

It is expected that the applicant will have some experience of nuleic acid hybridisation techniques and/or cell biology. The required techniques are currently in use in this Department of Pathology, so training is available.

Initial salary in the range £8675-£9865 (Research Assistant Grade 1B) according to age, qualifications and experience.

For further details telephone Bristol 303136 (ansaphone after 5.00 p.m.) or write to **Personnel Office, Senate House, Bristol BS8 1TH.** Please quote reference A261.

Informal enquiries about the post may be made by telephone to Dr. N Rooney (0272-230000 – Ext. 2869). (8717)A

DEPARTMENT OF TRADE AND INDUSTRY

Laboratory of the Government Chemist
Teddington, Middlesex

Research Worker

We have recently embarked upon a research programme in analytical molecular biology (AMB) aimed at the development of practical techniques for the detection and identification of specific (and foreign) DNA sequences in the presence of a large excess of genomic DNA. Many applications to analytical science are envisaged. The work is being performed in collaboration with King's College, London.

We are looking for a research worker to lead the small AMB team and to be responsible for the practical management of the programme and liaison with analytical groups in the LGC and with workers at King's. Specific objectives will include the management and training of staff of the LGC, development of contact with workers in complementary areas of science, and the presentation of results of the programme at symposia and in the scientific literature.

You should have a 1st or 2nd class honours degree in biochemistry, molecular genetics or molecular biology with at least 2 years' post-graduate experience. A PhD and experience of recombinant DNA technology and DNA cloning and sequencing are preferable.

Starting salary will be in the range £11,230-£14,730 (including £725 Outer London Weighting) with further increments, depending on performance, up to £17,100.

RELOCATION ASSISTANCE UP TO £5000 MAY BE AVAILABLE.

For further details and an application form (to be returned by 31 March 1989) write to Civil Service Commission, Alencon Link, Basingstoke, Hants RG21 1JB, or telephone Basingstoke (0256) 468551 (answering service operates outside office hours). **Please quote ref: SA/15/MB.**

The Civil Service is an equal opportunity employer

MAX-PLANCK-INSTITUTE OF BIOCHEMISTRY

Staff Scientists (BATIIa)
Postdoctoral Fellows
Research Technicians

Several positions are available immediately in the newly established Department of Molecular Biology. Successful applicants will have extensive experience in one or several of the following research disciplines: molecular biology, cell biology, cell physiology, and protein chemistry and purification. The research program of the new Max-Planck division will focus on structure/function analysis of cell surface receptors, the molecular basis of receptor-mediated signal transduction, and the involvement of growth factors and their receptors in human cancer.

Please send applications including CV and names of two referees to **Dr. A. Ullrich, Max-Planck-Institut fur Biochemie, D-8033 Martinsried bei Munchen, F.R.G.**

(W5966)A

CIBA-GEIGY Animal Health is seeking qualified individuals to fill open positions within its BIOVET Unit, a young and dynamic R & D group established in 1985 to pursue product opportunities in animal health care based on biotechnology-derived materials. Specifically, we look for a

R & D Scientist

with a DVM degree plus a minimum of 2-3 years of post-graduate training (such as residency, industrial experience or a PhD) in the areas of Internal Clinical Medicine and/or Pathology. We also look for a

Postdoctoral Fellow

with a DVM degree plus further training in Immunology or Microbiology.

Candidates for both positions must have a thorough knowledge of the livestock industry in North America or Europe and a minimum of one year experience in general veterinary practice. Expertise in data management and statistics is desirable.

The prospective members of the team will be working in our R & D center situated in the French-speaking area of Switzerland. They will have the excellent opportunity to work in a highly interactive environment and to contribute actively to the solution of practical problems in animal health care.

Please send your application with documented history under code "Nature 238" to Mr. H. Schmid, CIBA-GEIGY Ltd., Personnel Department, P.O. Box, CH-4002 Basle.

(W5975)A

CIBA–GEIGY

ASTROPHYSICS DEPARTMENT, SACLAY, FRANCE

Tenure-track Position in Extragalactic Astrophysics

The Astrophysics Department of the Center for Nuclear Studies, Saclay, France, invites applications for a tenure-track position in the general area of extragalactic astrophysics. The Department is part of the General Physics Division of the Institute of Fundamental Research of the Commissariat à l'Energie Atomique, the French Atomic Energy Commission. Current, but not exclusive, interests of the Department are on galaxy evolution, clusters of galaxies, large-scale structures in the universe, along with star formation regions, stellar evolution, nucleosynthesis and compact binaries. The Department is heavily involved in the design and manufacturing of instruments for the main European space observatories ISO and XMM, as well as the γ-ray imager "Sigma", soon to be launched aboard the Soviet satellite Granat.

The successful applicant is a senior scientist, who will interact with the various groups of the Department. He is expected to strengthen theoretical and observational programs, in connection with the above space experiments. The position is for six months to one year, starting in fall 1989 or winter 1990, with a high probability of tenure at the end of this term. There is no restriction on nationality. Salary will be commensurate with experience, with a net minimum of about 200 000 FF per year. Applicants should send a statement of research interests and projects, vita, publication list, and arrange to have three letters of recommendation sent to **Dr. Catherine Cesarsky, Head,** at the address below.

The deadline is May 31, 1989.

Postal address: Service d'Astrophysique, Centre d'Etudes Nucléaires de Saclay, 91191 Gif-sur-Yvette Cedex,France. Fax: +33 1 69 08 65 77. E-mail (Span): 32779: NOELLE.

(W5963)A

POSTDOCTORAL PHARMACOLOGIST

Pfizer is a world leader in the field of therapeutic drug research and development. In order to maintain the momentum and productivity of our research programmes we are seeking to recruit an enthusiastic young Pharmacologist with broad experience of *in vivo* techniques to our General Biology Group.

The role of the General Biology Section is to evaluate the effects of novel chemical entities on physiological systems to follow up unexpected observations and to develop new models of pathophysiological disease processes. This involves *in vitro* and *in vivo* evaluation using classical and biochemical, immunological and pharmacological techniques. To cover this spectrum of activities, the team consists of approximately 10 individuals and a vacancy has arisen for a senior pharmacologist/physiologist.

If you enjoy the challenges of discovery research and can transmit your enthusiasm to others then this is an ideal opportunity to work in modern, well-equipped laboratories, supported by the technical and financial resources of one of the world's foremost and highly respected pharmaceutical companies.

This is a particularly exciting time to join Pfizer as we have a number of new therapeutic agents being launched on world markets and others reaching the final stages of their development. We also have a multi-million pound expansion of our research facilities under construction, demonstrating our long-term commitment to research here at Sandwich and enabling our scientists to look forward with confidence to the 1990's and beyond.

If you join us, you will be paid a good salary, be eligible for an annual performance bonus of up to 20% of salary, participate in our excellent employment benefit package of pension, share ownership and private medical insurance schemes and be able to live in one of East Kent's charming towns or villages. Naturally, we will pay your removal expenses.

If this advertisement attracts your interest, please write in confidence, giving full details of career to-date to Mr D O'Callaghan, Pfizer Central Research, Ramsgate Road, Sandwich, Kent CT13 9NJ. Tel: (0304) 616181.

THE UNIVERSITY OF LEEDS
SCHOOL OF MATERIALS
(DIVISION OF CERAMICS)

PREDOCTORAL RESEARCH ASSISTANT/POSTDOCTORAL RESEARCH FELLOW

A vacancy exist in the area of Silicon nitride — titanium nitride particulate composites to join a small team working in related aspects of the programme.

The post is available immediately for a fixed term of up to one year; there is a possibility of appointment for a further, shorter, period becoming available.

Candidates for Research Assistant should have a good honours degree in an appropriate discipline, and for Research Fellow a PhD or equivalent industrial experience.

Salary for Research Assistant on R/A IB (£8675-£11680), and for Research Fellow on R/A IA (£9865-£12760), according to qualifications and relevant experience.

Informal enquiries to Dr. F. L. Ridley (tel. 0532 332541) fax: 0532 42253.

Application forms and further particulars may be obtained from and completed applications sent to the **Registrar, the University, Leeds LS2 9TJ, (tel. 0532 333965)** quoting reference no. 62/29. *Closing date for applications 6 April 1989. (8731)A

Sandoz Institute for Medical Research

Senior Scientist

Neuropharmacology

Applications are invited for the post of Senior Scientist in the Laboratory of Neuropharmacology at the Sandoz Institute. This laboratory uses a variety of methods, including electrophysiology, to examine drug actions on the peripheral and central nervous system. These studies are part of interdisciplinary programmes concerned with the development of novel analgesics and with basic research in neurobiology.

The Sandoz Institute occupies modern laboratories within the premises of University College, London. It comprises some 60 permanent staff as well as post doctoral fellows and research students. A range of biological expertise and interests are represented and fostered.

Candidates for the Senior Scientist position should have post doctoral experience. A knowledge of pharmacology and expertise in electrophysiology would be desirable.

Starting salary would be in the range of £19,500-£24,000 – depending on age and experience. Those interested are invited to apply or write for more information. Applications should include a curriculum vitae and the names of two referees. Send to

Ms M-C. Stuart, Sandoz
Institute for Medical Research,
5 Gower Place, London WC1E 6BN.
Closing date: 30 April 1989.

An exciting opportunity in Molecular Biology

c.£13,500
Beckenham, Kent

- **The Wellcome Foundation Ltd.**
- **Major International Pharmaceutical Group**
- **Research Centre at Beckenham**
- **Annual Turnover >£1,250m**
- **An Equal Opportunity Employer**

The Wellcome Foundation is internationally renowned for its innovative research and the development of new medical products, many of which represent significant advances in human health care. These developments are dependent upon maintaining an extremely high standard of research activities within the Company.

The recently established Department of Molecular Sciences currently has an exciting opening for a talented and highly motivated young scientist to join an existing WHO-funded research programme aimed at developing new chemotherapeutic agents for the treatment Onchocerciasis (river blindness). We are seeking a molecular biologist to work alongside established scientists in a multi-disciplinary team. This will be a one year appointment with good prospects of renewal.

Candidates should possess a Ph.D. in molecular biology with an interest in applying their skills to challenging problems in parasitology.

Salaries will be in excess of £13,500, dependent on age and qualifications.

The company offers excellent benefits including 5 weeks' holiday, pension scheme, subsidised restaurant and first-class sports and social facilities on site.

Please write with full career details to Miss S. J. McKinlay, Personnel Officer, The Wellcome Research Laboratories, Langley Court, Beckenham, Kent BR3 3BS, quoting reference number 91/69.

RESEARCH ASSOCIATE

Research Associate position available starting July 1989 at Bascom Palmer Eye Institute, Department of Ophthalmology, University of Miami School of Medicine, Miami, Florida, to study molecular aspects of human genetic ocular diseases. Recombinant DNA techniques are primarily used to study retinitis pigmentosa gyrate atrophy and retinoblastoma.

Applicant should have Ph.D./M.D. Experience in molecular biology preferred but not required.

Send curriculum vitae and names, addresses and telephone numbers of three references to: **Dr. George Inana, National Institutes of Health, Building 6, Room 232 Bethesda, MD 20892.**

University of Miami is an Equal Opportunity/Affirmative Action Employer.

(NW3461)A

ASSISTANT OR ASSOCIATE PROFESSOR OF ANATOMY

Applications are invited for tenure-track positions at the assistant or associate professor level. Applicants at the assistant professor level should have a Ph.D., M.D., or equivalent, postdoctoral experience, an active research program with a high potential for attracting external support, and promise of ability as a teacher. Applicants at the associate professor level should have an ongoing, externally funded research program, and established record of scholarship supported by substantial publications, teaching experience, and a record of successful direction of doctoral candidates or fellows. Specific research areas are open, although preference will be given to cellular and molecular biology. Areas of specific teaching expertise are also open, although experience in or ability to teach gross human anatomy is highly desirable. *Women and minorities are encouraged to apply.*

Send curriculum vitae, bibliography, a brief statement of research and teaching experience, plus names of three references to: **Chair, Anatomy Faculty Search Committee, The University of Iowa College of Medicine, Iowa City, IA 52242.**

The University of Iowa is an Equal Opportunity/Affirmative Action Employer.

UNIVERSITY OF EDINBURGH

)epartment of Botany

Postdoctoral Research Associate

postdoctoral research asso-ate is required to investigate e basis of hyphal guidance id infection structure differ-itiaton in the bean rust ngus. Fluorescence ratio aging will be used to deter-ine the roles of intracellular alcium and pH in these pro-sses. This A.F.R.C.-funded oject will be supervised by rs. N. D. Read and A. J. rewavas.

he post is tenable for three ears. Applicants should send curriculum vitae with the ames of two referees to **Dr. N. . Read, Dept. of Botany, niversity of Edinburgh, ing's Buildings, Mayfield oad, Edinburgh EH9 3JH.** lease quote reference no. 648. (8750)A

UNIVERSITY OF MANCHESTER

RESEARCH ASSISTANT/ASSOCIATE

Applications are invited for the above post, in the Department of Cell and Structural Biology, from postdoctoral candidates or graduates to work on a project concerned with the interplay between matrix macromolecules and soluble growth factors in the regulation of fibroblast function during wound healing. Extensive use will be made of cell culture techniques. Excellent facilities are available for all cell and molecular biological techniques. Initial funding is available for three years on salary range £9,865-£11,680 p.a. (postdoctoral) or £8,675-£10,460 p.a. (graduate).

Please forward complete CV and names of at least two academic referees to: **Dr Seth L. Schor, Department of Cell and Structural Biology, the University, Manchester M13 9PL.** The University is an equal opportunities employer. (8718)A

KEEPER OF MINERALOGY

LONDON

Mineralogy is one of five major scientific departments within the British Museum (Natural History). As well as housing one of the world's leading collections of minerals, meteorites and rocks, the Department operates a superbly-equipped research unit featuring the most advanced analytical systems, including an electron microscope and an infra-red spectrometer. The Museum now wishes to appoint a scientist of considerable professional standing to lead this prestigious Department.

The Keeper has wide-ranging curatorial, scientific and managerial responsibilities, and enjoys great influence within the scientific community. As well as being responsible for the care and development of the collections, the new Keeper will direct the work of a 30-strong research team which includes acknowledged experts in various aspects of mineralogy. The managerial component of the role embraces everything from financial control to the leadership of all grades of staff.

The successful candidate will be a scientist whose work in mineralogy or related disciplines has already won an international reputation. A knowledge of the care and maintenance of mineral collections and strong administrative abilities are also essential.

Starting salary (from April 1989) is in the range £29,920-£33,350 (including £1750 Inner London Weighting) with further increments depending on performance up to £38,535.

For further details and an application form (to be returned by 14 April 1989), write to Civil Service Commission, Alencon Link, Basingstoke, Hants RG21 1JB, or telephone Basingstoke (0256) 468551 (answering service operates outside office hours.)

Please quote ref: S/7882.

An equal opportunity employer.

(8769)A

DIRECTOR FOR NEW AIDS RESEARCH CENTER AND LABORATORY

A strong basic scientist experienced in the molecular biology of AIDS is sought to direct the activities of the new Aaron Diamond AIDS Research Laboratory for the City of New York, sponsored and supported jointly by New York University School of Medicine, the Department of Health of New York City, the Public Health Research Institute and The Aaron Diamond Foundation. Governance of the center is by a Board of Directors drawn in part but separate from the sponsoring institutions.

Creation of a strong research environment and the prosecution of molecular virologic and/or immunologic research on AIDS and related diseases should be the Director's primary objectives; the center should serve as a focus for collaborative activities involving scientists and physicians throughout New York City.

Abundant research space that will include BL-3 containment facilities is under construction. Start-up funds have been provided. The position carries a tenured professorship at NYU; salary will depend on qualifications.

Inquiries including curriculum vitae and bibliography should be sent to the Chairman of the Board of Directors:

Dr. Edwin D. Kilbourne, Box 1124, Mount Sinai School of Medicine, 1 Gustave Levy Place, New York, NY 10029.

(The Board is committed to Equal Opportunity/Affirmative Action in employment.) (NW3446)A

ST GEORGE'S HOSPITAL MEDICAL SCHOOL (University of London)

LECTURER/SENIOR LECTURER IN NEUROSCIENCES

Applications are invited for an established lectureship or senior lectureship in neurosciences. The post will be held in one of the preclinical departments, according to the research interests of the successful applicant. Preference may be given to applicants with research interests in the central nervous system or in integrative aspects of neurosciences. The level of appointment will depend on qualifications and experience. Informal enquiries may be made to the Chairman of the Department of Physiology, Professor J G Widdicombe (01-672 9944 ext 55390).

Further particulars and an application form from the **Personnel Officer, St George's Hospital Medical School, Cranmer Terrace, London SW17 0RE** (01-672 9944 ext 56020). Closing date 12 April 1989. Quote reference 38/89. (8744)A

UNITED MEDICAL AND DENTAL SCHOOLS

QA Standards Development and Validation

£12,000-£17,000
Beckenham, Kent

- **A world leader in Biotechnology**
- **Novel therapeutic proteins and vaccines**
- **Established in 1982**
- **A subsidairy of the Wellcome Foundation Ltd.**
- **An Equal Opportunity Employer**

Wellcome Biotech is at the forefront of the application of biotechnology to the production of new medical products and currently has an opening for a Senior Scientist to lead a small group involved in QA Standards Development and Validation.

Reporting to the Head of the QA Biological Assay Section, you will be engaged in the identification and development of a range of biological assays to ensure the quality of novel therapeutic proteins. The work will be concerned with the functional, clinical and purity aspects of the product and will involve a wide range of immunochemical, tissue culture and virological techniques.

In addition to holding a PhD in a relevant subject, you will have at least 5 years' practical experience and knowledge of immunological and virological assays. An interest in computing and an understanding of statistical analysis would also be an advantage.

In addition to an attractive salary, you can look forward to an extensive range of benefits which includes 5 weeks' holiday, pension scheme, profit share scheme, first-class sports and social facilities and a subsidised restaurant.

If you are interested in this position please write with full career details for an application form, to Alison Baker, Personnel Assistant, The Wellcome Research Laboratories, Langley Court, Beckenham, Kent BR3 3BS, quoting reference 91/68.

Previous applicants need not apply.

RESEARCH SCIENTIST PHARMACOLOGY

Amgen is a dynamic, growing organization producing human therapeutic products through recombinant DNA technology. Our leadership in the development of Erythropoietin and Granulocyte Colony Stimulating Factor has placed us at the leading edge of the biotechnology industry. Our continued growth has created an immediate opportunity for a Research Scientist in our Pharmacology Group.

Applicants must possess a Ph.D. in Pharmacology or a related discipline with a strong background in whole animal research and experience in one or more of the following areas: inflammation, wound repair, immunopharmacology, hematology and oncology. Proficiency in statistical analysis of data is essential, and postdoctoral training is highly desirable.

Amgen offers a competitive compensation and benefits package, including equity participation, as well as a challenging and stimulating research environment. Our location one hour northwest of Los Angeles offers the best in Southern California living. Qualified applicants should direct a resume and a list of 3 references, in confidence, to:

UNIVERSITY OF GLASGOW

TWO POSTDOCTORAL POSITIONS

1. MOLECULAR BIOLOGISTS

A scientist with experience in protein and/or nucleic acid research is required to work on a project involving Adenovirus genetics and gene regulation.

2. CELL BIOLOGIST/ZOOLOGIST

A scientist with experience in cell biology or animal pathology is required to work on herpes virus pathogenicity and/or latency. This position offers the opportunity for collaborations with molecular biologists, immunologists and geneticists to investigate the specific role of individual virus genes. The complete viral DNA sequence is known providing a firm foundation for this investigation.

Both positions are available for three years on the Non-Clinical Scientific Staff with salary starting at an appropriate point on Grade II (currently £11,070-£14,500 pa). Previous experience with virus systems is advantageous but not essential as training would be provided in well equipped laboratories.

Applicants should send a Curriculum Vitae together with the names and addresses of three professional referees to the **Director, Professor J H Subak-Sharpe, Institute of Virology, University of Glasgow, Church Street, Glasgow G11 5JR.**

Closing date: 14 April 1989.

PETROLOGY-GEOCHEMISTRY OF MINERAL DEPOSITS/AMERICAN MUSEUM OF NATURAL HISTORY

The Department of Mineral Sciences of the American Museum of Natural History invites applications for a tenure-track position as Assistant Curator of petrology and geochemistry of mineral deposits. We seek a creative scientist whose primary rsponsibility will be to carry out a vigorous research program related to mineral deposits. This research may have a structural/tectonic, theoretical or experimental approach to the study of ore deposits, but all should also be sample- and field-oriented. Collaboration with outside investigators to broaden the scope of research is encouraged. It is expected that the curator will supervise Ph.D. students in the AMNH-Columbia-CUNY Ph.D. program in geoscience and will develop relevant courses. The Museum is a repository for important research collections, and the curator is expected to develop significant ore deposit collections. Other duties include participation in departmental activities and occasional development of Museum exhibitions, seminars and courses.

The Department encompasses the fields of mineralogy, petrology, mineral deposits and meteoritics with 5 Ph.D. researchers; post-docs, research associates and support staff help with research and collections. Instrumentation includes a 9-spectrometer ARL-SEMQ microprobe with EDS, a Zeiss digital SEM with EDS, automated powder and single-crystal X-ray diffractometers, fluid inclusion and petrographic microscopes, sample preparation facilities and a network of microcomputers.

Applications should be submitted by May 15; the search will continue until a suitable candidate is found. Salary is competitive depending upon the experience of the candidate. Applicants must have a Ph.D. in hand (or nearly so) and should send a curriculum vitae, a succinct description of research interests and the names of three references to:

Dr. George E. Harlow

NEW INITIATIVE IN MOLECULAR SCIENCES

Pfizer, one of the world's foremost and highly respected pharmaceutical companies, has opportunities for graduate and post-graduate scientists in a creative research environment.

We are building up a Molecular Sciences Group which will play a major part in our Drug Discovery programmes. We are now seeking to recruit experienced Senior Scientists and Research Assistants in Molecular Biology and related disciplines.

SENIOR SCIENTISTS

VECTOR DESIGN AND CONSTRUCTION

- ★ PhD in Biochemistry, Molecular Biology or Microbiology
- ★ Experience with vector construction and biochemical manipulation of DNA.

MICROBIAL AND MAMMALIAN EXPRESSION SYSTEMS

- ★ PhD in Biochemistry, Molecular Biology or Molecular Virology
- ★ 1-3 years post-doctoral experience in biotechnology
- ★ Working knowledge of cellular transfection techniques
- ★ Tissue culture experience

PEPTIDE AND GENE SYNTHESIS

- ★ PhD in Chemistry, Biochemistry, or Molecular Biology
- ★ Experience with automated peptide or oligonucleotide synthesis

PROTEIN PURIFICATION

- ★ PhD in Biochemistry, Protein Chemistry or related field
- ★ Post-doctoral experience with a working knowledge of protein purification from recombinant sources
- ★ Working knowledge of HPLC, affinity, ion-exchange and size exclusion chromatographies

If you are a successful applicant you will have the opportunity to play a major role in co-ordinating drug-discovery strategies in diverse therapeutic areas and eventually be responsible for the day-to-day management of a team of specialists and therefore you should have well-developed supervisory and interpersonal skills. Experience in leading scientists in an industrial research environment would be an advantage.

RESEARCH ASSISTANTS

In addition there will be a number of positions available for graduate Research Assistants within the same disciplines. Candidates for these positions should have the following qualifications:

- ★ BSc or equivalent in Biochemistry, Molecular Biology, Virology or Microbiology
- ★ 1-5 years experience using cell or molecular biology techniques.

This is a particularly exciting time to join Pfizer as we have a number of new therapeutic agents being launched on world markets and others reaching the final stages of their development. We also have a major multi-million pound expansion of our research facilities under construction demonstrating our long-term commitment to research here at Sandwich and enabling our scientists to look forward with confidence to the 1990's and beyond.

If you join us, you will be paid a good salary, be eligible for an annual performance bonus of up to 20% of salary, participate in our excellent employment benefit package of pension, share ownership and private medical insurance schemes and be able to live in one of East Kent's charming towns or villages. We will naturally pay your removal expenses.

If you are interested send a brief c.v. to Mr D O'Callaghan, Pfizer Central Research, Ramsgate Road, Sandwich, Kent CT13 9NJ.

Pfizer

DRUG DISCOVERY

Neuroscience Research Division

TEAM LEADER—COGNITION

The selected candidate will lead an interdisciplinary research team developing novel drugs for use in the treatment of CNS neurodegenerative disorders including Alzheimer's disease. The qualified candidate will have an extensive background in radioreceptor binding, receptor-effector coupling mechanisms and isolated cell and tissue assays, plus a broad knowledge of the cognition field. Strong evidence of innovative research and leadership skills are essential. We require a Ph.D. in Pharmacology, Neuroscience or Biochemistry with 5-10 years experience, as well as a solid record of scientific accomplishment in the field. Previous experience in drug development and management of a scientific team or leadership of an academic research laboratory are highly desirable. **Reply to job TL.**

NEUROPHARMACOLOGIST—COGNITION

The qualified candidate will be involved in a multi-disciplinary research program which develops novel drugs for the treatment of cognitive disorders. You must have experience in radioreceptor binding assays, second messenger systems and in vitro cell and tissue assays. A Ph.D. in Pharmacology, Neuroscience or Biochemistry with 2-5 years of industrial or postdoctoral work are required. Communication and supervisory skills are essential. **Reply to job C.**

NEUROPHARMACOLOGIST—PEPTIDES

The qualified scientist will participate in an interdisciplinary research effort to discover novel therapeutic entities based on peptide neurotransmitters. Experience with radioreceptor binding assays, receptor-effector coupling and in vitro systems is essential. A Ph.D. in Pharmacology, Physiology, or Biochemistry is required, along with 2-6 years postdoctoral training. Exceptional communication, interpersonal and supervisory abilities are also necessary. Previous work in pharmaceutical drug development is desirable. **Reply to job P.**

Abbott offers an excellent salary and benefits package including profit sharing and a stock retirement plan. We are located in an attractive suburban area 30 miles north of Chicago.

Abbott representatives will be at the FASEB meeting in New Orleans, March 20th-23rd.

To arrange an interview, or if you will not be able to attend, send your resume indicating job interested in to: Patricia Handy, Corporate Placement, Dept. NAT/3-16, Abbott Laboratories, Abbott Park, IL 60064. Abbott is an Affirmative Action Employer.

ABBOTT LABORATORIES

(NW3463)A

Group Leader

ADVANCED THERAPIES FOR CANCER AND INFLAMMATORY DISEASE.

Celltech is one of Europe's foremost biotechnology companies. Operating from our modern purpose-built facilities in Slough, we are among the leaders in the research, development and manufacture of protein-based drug products. We have built up a portfolio of successful candidate therapies, and are now establishing a fully integrated biopharmaceutical capability.

We are looking for an experienced pharmacologist/immunologist to lead a small group studying the therapeutic potential of our drug products. Researching into the mechanisms of biopharmaceuticals for cancer and inflammatory disease, you will use in-vitro and in-vivo models to evaluate the pharmacological value of reagents for specific therapies.

Aged between 30 and 35, you will be PhD qualified in either Pharmacology, Immunology or Cell Biology. You must have between 3 and 6 years' post-doctoral experience including in-vivo research in pharmacology and immunology, either in academia or industry. A natural and easy communicator, you will have the inter-personal skills to manage a scientific team, as well as the ability to produce original research material.

A highly competitive salary will be supported by a comprehensive benefits package which includes a pension scheme, discounted BUPA and relocation assistance if appropriate.

Please write, with full details of your qualifications and experience to date, to Mrs Jane Smith, BSc C BIOL MI BIOL, at Celltech Limited, 216 Bath Road, Slough, Berkshire SL1 4EN. Please quote Ref: 255.

Scientific Director

A privately-owned French pharmaceutical group of companies which is expanding rapidly in the international sphere, is seeking a Scientific Director who will take responsibility for an established modern research centre with a staff of 200 and an annual budget of around US$20 million.

Reporting directly to the President of the Group, the Scientific Director will co-ordinate the activities of the various on-site research departments with those of collaborative projects in external government, universities and private laboratories.

The Scientific Director will optimise the use of human and financial resources and participate in the establishment and selection of the principal fields of research. You will also manage the integration of research programmes arising from partnerships with other companies.

The present major research interests of the Group are:

- cardiovascular pharmacology
- immunology
- gastroenterology
- new technologies for drug delivery.

To apply you must have acquired sufficient research and management experience for a position of this importance. You will have a PhD in biochemistry or pharmacology, or the equivalent. A qualification in businesss management is desired. Fluency in French and English will be required and a working knowledge of German would be helpful.

You will have already led research projects successfully and have demonstrated managerial capacity. Through your personal qualities and scientific experience you will be able to motivate and direct a large research centre towards the discovery of new products.

The research centre is located in a university town in an extremely pleasant part of France.

The very substantial salary to be offered is in keeping with the importance of this position.

Interested and appropriately qualified persons should write to Media System Limited, Garden House, Cloisters Business Centre, 8 Battersea Park Road, London SW8 4BG, enclosing their curriculum vitae and a photograph. Please quote ref: 1953.

POSTDOCTORAL RESEARCH ASSISTANT 1A

BR/286

Applications are invited for the above position, available immediately, to work on an SERC supported project concerning the consequences of structural asymmetry for catalysis of the F0/F1 ATP synthase under the joint supervision of Dr. I. D. Campbell and Dr. S. J. Ferguson.

The project involves the use of isotopic labelling and NMR, and funding is available for up to 2 years in the first instance.

Salary on the scale £9,865-£15,720 depending upon age and experience.

Applications, including a curriculum vitae and the names and addresses of two referees, should be sent to: **The Administrator.**

An Equal Opportunity Employer. (8728)A

DEPT OF BIOCHEMISTRY, SOUTH PARKS ROAD, OXFORD, OX1 3QU

POSTDOCTORAL

Cloning and characterisation of yeast mutants altered in their sensitivities to lethal effects of bleomycins. Background in molecular biology and genetics, cellular biology, or biochemistry. Experience with yeast preferred but not required.

Send curriculum vitae and list of three references to: **Dr. Carol Wood Moore, Department of Microbiology, City University of New York Medical College of Cuny and School of Biomedical Education, Room J-910, City College of CUNY, Convent Avenue at 138th Street, New York, NY 10031.**

An Affirmative Action/Equal Opportunity Employer M/F. (NW3348)A

Post-doctoral position

available in a molecular biology laboratory devoted to the study of acquired and inherited blood disorders (leukemia and hemoglobinopathies). Experience in molecular biology is desirable. Send application with C.V. and names of 3 references to **Dr. D.F. Atweh, SUNY Health Science Center, VA Medical Center (111D), 800 Poly Place, Brooklyn, NY 11209.**

SUNY is an equal opportunity/affirmative action employer (NW3464)A

CAMBRIDGE UNIVERSITY

POSTDOCTORAL MOLECULAR BIOLOGIST

A postdoctoral scientist with experience of nucleic acid or protein manipulation is needed to join an active well-funded group working on bacterial hemolysins. We are particularly interested in the transcriptional activation of hemolysin synthesis and export, and the mechanism by which hemolysin protein is translocated across both bacterial membranes (Nucleic Acids Research (1988) 16: 4789-4800; EMBO Journal (1989) 8: 595-607).

Information may be obtained from **Dr. Colin Hughes (0223 333732)** and applications should be sent to him at the **Cambridge University Department of Pathology, Tennis Court Road, Cambridge CB2 1QP, England.** (8700)A

DIRECTOR OF MOLECULAR NEUROBIOLOGY

Impact products, processes and your career

Hoechst-Roussel Pharmaceuticals Inc., an internationally based pharmaceutical company and world leader in CNS research, has an immediate opening in its Neurosciences Research Group for a Director to set up and head its newly created Molecular Neurobiology Department.

This Department will work in close collaboration with existing innovative drug discovery groups in CNS Pharmacology, Biochemical Pharmacology and Medicinal Chemistry. Emphasis of the group will be on development of methodology and basic knowledge relevant to establishing IN VIVO/IN VITRO models for the evaluation of drugs to treat Alzheimer's disease, schizophrenia and affective disorders. Particular focus will be on identification, isolation, and characterization of genes and gene products associated with these diseases, and the study of gene regulation mechanisms.

Requirements of this position include a Ph.D in molecular biology, neurobiology, biochemistry, or a closely related field with extensive experience in the study of gene expression in the central nervous system. The successful candidate will also have a significant record of research accomplishments in molecular biology and a demonstrated ability to direct a multi-disciplinary research team.

Position is located in our modern research facilities on a 110-acre campus in Bridgewater, New Jersey, convenient to good housing, recreation and educational facilities, and offers a comprehensive salary and benefits package.

Please send resume with salary requirements in confidence to: Nancy Wilkerson, Manager, Human Resources, Building M-303, Department 36, Hoechst-Roussel Pharmaceuticals Inc., Route 202-206, P.O. Box 2500, Somerville, NJ 08876-1258. An Affirmative Action Employer M/F/H/V.

Hoechst

CHAIRPERSON

DEPARTMENT OF HUMAN ANATOM'

The School of Medicine, University of California, Davis, invites applications an nominations for the position of Chai person of the Department of Huma Anatomy. The department currentl comprises 10 tenure-track faculty, housed in a modern laboratory building offers genuine training in cell biology anatomy and related disciplines, and i responsible for the teaching of gross neuro and microscopic anatomy an aspects of cell biology in the medica curriculum. Candidates must have distinguished record of scholarship an professional achievements in the area o cell biology, as evidenced by publication and grant awards. They also must hav leadership and administrative abilities and an interest in the departmental teach ing mission. A committment is required t building a strong independent, extra murally funded research program ir modern cell biology as well as to augmen ting departmental research in this area; ar opportunity to appoint a number of new faculty members is available.

Applicants should submit a letter of application, curriculum vitae, a summary of research goals and the names of five references to: **Hibbard E. Williams, M.D., Dean, School of Medicine, University of California, Davis, CA 95616.**

This position will be "Open Until Filled; applicants must be received by July 31, 1989. The University of California, Davis, is an Affirmative Action/ Equal Opportunity Employer. (NW3478)A

SCIENTISTS

PANLABS is expanding its U.S. laboratory facilities to accommodate rapid growth in the Pharmacology Services Division and the Microbial Products Services Division. Applications for positions in the following areas are currently being accepted:

BIOCHEMICAL PHARMACOLOGY

Ph.D. 2-5 years experience

We have an opportunity for a scientist with a demonstrated record of scientific innovation and independence to participate in the start-up and development of a new biochemical pharmacology laboratory. Responsibilities include implementation, validation and automation of high-throughput assays for drug discovery and characterization, including radioligand binding, enzyme activity, and cellular functional responses. Background in immunopharmacology and industrial experience desirable. The successful candidate will play an important role in determining future research directions and staffing for the lab.

NATURAL PRODUCTS/BIOORGANIC CHEMISTS

Ph.D. 0-5 years experience
MS Scientists 3+ years experience

The successful candidates will be part of a multidisciplinary team including biochemists, pharmacologists and molecular biologists. One of the initial responsibilities of these positions will be to purify small bioactive molecules from fermentation broths using standard chemical procedures in combination with liquid chromatography (HPLC).

PANLABS is a growing U.S. based international company that has provided R & D services to pharmaceutical companies and the fermentation industry worldwide for almost 20 years. Located in the high tech corridor north of Seattle, Panlabs offers excellent salaries and benefits. Please send CV with names and phone numbers of three references to:

Bothell, Washington 98011

An Equal Opportunity Employer

(NW3465)A

UNIVERSITY OF NEWCASTLE UPON TYNE DEPARTMENT OF MICROBIOLOGY

TWO RESEARCH ASSOCIATES

Molecular biology/Immunology
Bacterial virulence/vaccines

Applications are invited from graduate or post-doctoral researchers to work with a multidisciplinary Microbial Pathogenicity-Immunology Group, studying the molecular biology of bacterial virulence and vaccine design. One candidate will work with a team studying the design and construction of defined epitope vaccines that incorporate both defineds B-cell and T-cell epitopes and that can be delivered to the host by live delivery systems. The second candidate will study structure-function relationships in bacterial protein toxins, particularly staphylococcal enterotoxins. Experience with recombinant DNA, protein engineering and immunological techniques could be an advantage, but is not essential as training will be provided. One appointment is for two years and seven months, and the second for three years. Further details can be obtained by 'phoning Dr M Kehoe on (091) 222 8143.

The appointments will be made at appropriate points on the Grade IA (£9,865-£15,720 p.a.) or Grade IB (£8,675-£11,680 p.a.) scales, depending on qualifications and experience. Applicants should send a c.v., including the names and addresses and phone numbers of 3 referees, to **Dr M Kehoe, Department of Microbiology, Medical School, Framlington Place, Newcastle upon Tyne, NE2 4HH, England,** not later than 31st March 1989. (8724)A

THE LONDON HOSPITAL MEDICAL COLLEGE (University of London)

RESEARCH TECHNICIAN

Applications are invited for a post in the Mucocutaneous Biology Research Group to investigate the diversity and stability of fibroblast phenotype. Previous experience in tissue culture, hybridoma technology or immunocytochemistry is desirable.

The appointment is for up to 3 years and the starting salary will be £11,515 per annum.

For further information contact either Dr I M Leigh (01-377 7749) or Dr D M Williams (01-377 7060).

Applications to The Assistant Secretary, The London Hospital Medical College, Turner Street, London E1 2AD. (8739)A

UNIVERSITY OF CANTERBURY

New Zealand

SENIOR LECTURER OR LECTURER IN MOLECULAR BIOLOGY

(Department of Plant and Microbial Sciences)

pplications are invited for a posi-n, as above. Applicants should ve a Ph.D. degree in a relevant ld and an interest in plant olecular biology and plant viro-gy. The appointee will be expec-d to contribute to the teaching of urses in Biochemistry, Molecu-r Biology, Molecular Genetics d Virology and to pursue an tive research programme inclu-ng the supervision of M.Sc. and .D. students.

The salary for Senior Lecturer is a scale from NZ$49,000 to Z$57,000 per annum and a range om NZ$59,000 to NZ$63,000 per num; and for Lecturers is on a ale from NZ$35,000 to Z$42,500 (bar), NZ$44,000 to Z$46,000 per annum.

Further particulars and Condi-ons of Appointment, quoting osition No. PL1, may be btained from Appointments 36117), Association of Common-ealth Universities, 36 Gordon quare, London WC1H 0PF.

Applications close with: A. W. layward, Registrar, University of anterbury, Private Bag, Christ-hurch, New Zealand, on *28 April 989.* (W5968)A

UNIVERSITY OF GLASGOW

NEUROSCIENCE RESEARCH

Research Assistant

required to join a well re-sourced group investigating neurotransmitter receptor dynamics in relation to Alz-heimer's disease using quanti-tative autoradiography and in situ hybridisation.

Applicants should have a back-ground in pharmacology, physiology or biochemistry and hold or expect to obtain a good Honours degree in an appropriate discipline. Appli-cants should be committed to developing a career in neuro-science and will be encouraged to register for a Ph.D.

Applicants, comprisings C.V. and the names and addresses of two referees should be sent to **Professor J. McCulloch, Wellcome Neuroscience Group, University of Glasgow, Garscube Estate, Bearsden Road, GLASGOW, G61 1QB** by 21st April, 1989. (8761)A

IMMUNO

AKTIENGESELLSCHAFT FÜR CHEMISCH-MEDIZINISCHE PRODUKTE

Wir sind ein weltweit erfolgreiches pharmazeutisches Großunternehmen und erzeugen anerkannt hochwertige biologische Arzneimittel.

Hohes fachliches und persönliches Niveau unserer Mitarbeiter sowie intensive Forschung und Innovation stellen für uns die Grundvoraussetzung für eine erfolgreiche Behauptung unserer Führungsposition auf internationalen Märkten dar.

Zur Mitarbeit in unserem Forschungsbereich suchen wir eine(n)

Biochemiker/-in

mit langjähriger Erfahrung auf dem Gebiet der Proteinchemie und Enzymkinetik.

Ihre Hauptaufgabe wird in der selbständigen Durchführung biochemischer Forschungsarbeiten mit Hilfe chemischer und physikalischer Methoden (Affinitätschromatographie, Proteinreinigung) bestehen.

Biochemische Erfahrung auf dem Gebiet der Gerinnungs- und/oder Fibrinolysefaktoren wäre besonders wünschenswert.

Wir bieten eine vielseitige und anspruchsvolle Tätigkeit in unserer Wiener Zentrale. Die Dotierung entspricht internationalen Maßstäben.

Bei näherem Interesse stehen wir für ein informatives Gespräch gerne zur Verfügung bzw. laden wir Sie zur Übermittlung Ihrer Bewerbung ein (Ref. 217).

(8737)A

A RESEARCH ASSOCIATE

position is available immediately to study the mechanisms of transformation in human breast epithelial cells, mainly the interaction of carcinogens with oncogenes. Research experience in Molecular Biology is required.

Send curriculum vitae to **Dr. Jose Russo, Department of Pathology, Michigan Cancer Foundation, 110 East Warren Avenue, Detroit, MI 48201.**

(NW3455)A

UNIVERSITY OF LIVERPOOL

DEPARTMENT OF EARTH SCIENCES

Applications are invited for a Temporary Lectureship, tenable in the first instance for two years from 1st October 1989. The fields of interest of the candidates should be in *Structural Geology* or *Petrology*.

The *Structural Geologist* would be expected to complement existing research areas which include fault analysis, kinematics of thrust zones and microstructures.

The *Petrologist* would complement existing research interests in medium-to-high temperature fluid-rock interactions which would involve the use of stable isotope techniques.

The successful candidate in either field will be extensively involved in field and practical teaching.

Initial salary within the range £9,260-£13,365 per annum on the Lecturer A scale.

Applications, together with the names of three referees, should be received not later than 17 April 1989, by **The Director of Staffing Services (AS), The University, P.O. Box 147, Liverpool, L69 3BX,** from whom further particulars may be obtained.

Quote ref. RV/300/N.

An Equal Opportunity Employer (8715)A

UNIVERSITY COLLEGE LONDON

WITCHWEED RESEARCH AT UCL

The post of

POSTDOCTORAL PLANT PHYSIOLOGIST

is available for work on the parasitic weed Striga. The project is funded by Overseas Development Natural Resources Institute for two years, and is to investigate the effects of Striga on the Growth and Physiology of Maize.

Salary range £11680-14500 pa plus LW of £1650.

Further details and c.v. plus 2 references to **Professor G R Stewart, Department of Biology (Darwin Building), University College London, Gower Street, London WC1E 6BT,** or telephone **01-387 7050 ext. 2653.**

Equal Opportunities Employer

INTERNATIONAL CENTRE FOR MEDICAL RESEARCH (CIRMF)

Franceville, Gabon

CIRMF currently employs 165 people of 10 nationalities. It posseses well-equipped laboratories of immunoparasitology, microbiology, endocrinology, epidemiology and clinical biology; an excellent primatology centre and a good library.

A RESEARCH ASSISTANT/TECHNICIAN

is required in immunoparasitology. The candidate should possess either technical or graduate qualifications and have several years experience in modern immunological methods (monoclonal antibody production, cytotoxicity rests and basic immunochemical techniques). She/he would work in close collaboration with the head of the department, Dr. Margaret Pinder, and general duties will include maintenance of laboratory supplies.

The appointee would be expected to commence by September 1989. A 2-year contract (renewable) is offered which includes an attractive salary (based upon qualifications and experience); relocation, and expatriation allowances, housing on the 80 acre CIRMF campus and 60 days' paid annual leave. Ability to speak French would be an advantage.

Letters of interest will be held in confidence and should include detailed CV, publications list, and the names and addresses of 3 referees. Send this information to **Dr. G. E. Roelants, Deputy Director General, CIRMF, BP 769, Franceville, Gabon**, or telephone (241) 677132 or telex 6708 CIRMGAB or telefax (241) 677295 for further information. (W5979)A

MEDICAL RESEARCH COUNCIL
Institute of Hearing Research
POSTDOCTORAL BIOLOGIST

The Biology section of the Institute of Hearing Research has a new position for a post-doctoral scientist to work on hereditary deafness in mice. The project involves structural and functional studies of the inner ear during development. One particular interest of the section is the role of melanocytes in the development and function of the inner ear. The Biology section has good facilities for single unit and gross electrophysiology, light and electron microscopy, excellent computing and workshop support, and in addition has collaborative links with molecular genetics laboratories for genetic studies of deafness. Experience in electrophysiology, electron microscopy or molecular biology would be an advantage, but is not essential.

For further details about the projects available contact **Dr. K.P. Steel, MRC Institute of Hearing Research, University of Nottingham, University Park, Nottingham NG7 2RD, U.K. Telephone: 0602 223431. Fax 0602 423710.**

The position is a short term appointment for three years at a salary in the range £9,260 to £14,500 (Non-Clinical Scientific Grade II), starting preferably in October 1989. (8733)A

UNIVERSITY OF OXFORD
INORGANIC CHEMISTRY LABORATORY
SENSORS RESEARCH

Two Postdoctoral positions will be available in the Oxford Sensors Centre to work on (a) redox active ionophores (a.s.a.p.) and (b) enzyme electrochemistry from September 1989.

Salary will be on the Research IA scale.

Applications should be submitted to the **Administrator, Inorganic Chemistry Laboratory, South Parks Road, Oxford, OX1 3QR.**

The University is an Equal Opportunity Employer

(8746)A

THE UNIVERSITY OF LEEDS
DEPARTMENT OF PHYSICS
LECTURER
(3 POSTS)

The University of Leeds expects to be able to make the following three appointments in the Physics Department with effect from 1 September 1989:

N.A.A.S. POST

One lecturer in the field of experimental ultra high energy gamma ray astronomy, based at Haverah Park (Reference number 52/45).

INTERDISCIPLINARY RESEARCH CENTRE POSTS

Two temporary lectureships, each for a fixed term of two years, which will become available as a consequence of the establishment of an IRC in Polymer Science at Leeds. Applicants for these posts should have research interests in Condensed Matter Physics (52/48) or Astronomy and Astrophysics (52/47).

Salary for each post will be on the Lecturer Grade A scale (£9,260 – £14,500) according to qualifications and relevant experience.

Application forms and further particulars may be obtained from, and completed applications forwarded to, the Registrar, the University, Leeds LS2 9JT (Tel (0532) 333965 – direct line), quoting the appropriate reference number. Closing date for application 20 April 1989. (8763)A

MASSEY UNIVERSITY

Palmerston North, New Zealand

POSTDOCTORAL POSITION IN PROTEIN CRYSTALLOGRAPHY

Applications are invited for a Postdoctoral position in protein crystallography with an established group in the Department of Chemistry and Biochemistry.

The project is aimed at the determination of the three-dimensional structures of heat-stable enzymes by x-ray crystallography through the preparation of diffraction-quality crystals of enzymes and subsequent x-ray structure analysis. Mutants of several of the enzymes are currently being prepared. The appointee will also have the opportunity to participate in other protein structural projects in the laboratory.

Applicants with experience in protein crystallography are preferred, but small-molecule crystallographers or biochemists with an interest in protein structure are also invited to apply.

Facilities include CAD4 diffractometer, Evans and Sutherland PS330 interactive graphics system, Optronics microdensitometer, and rotating anode generator.

The position, which is for a period of up to two years, is available immediatley. Further information may be obtained from Dr E N Baker at the University.

Salary: NZ$35,000.

Applications, including a curriculum vitae, a list of relevant publications and the names and addresses of three referees, close with Mrs V B Bretherton, Personnel Section, Massey University, Palmerston North, New Zealand, on *30 April 1989*. (W5976)A

The position is available fr 1st April, 1989 for a period of months at the level of Basic Gra Microbiologist (£8,255-£11,0 per annum).

A science degree is require preferably with some microbio gical component or experience.

Further information may obtained from Dr J. W. Lee.

NHS terms and conditions v apply.

Application forms can be tained from the Personnel Offic PHLS Centre for Applied Mic biology & Research, Port Down, Salisbury, Wilts. SP4 0J Tel: (0980) 610391 Ext. 240, whom completed forms should returned by 31st March, 1 quoting Post No. 0711. (8751)A

RESEARCH ASSOCIATES

COR Therapeutics, Inc. is a recently established and rapidly growing biotechnology company located in the San Francisco Bay Area. We specialize in the development of novel therapeutics for cardiovascular disease. We are actively recruiting highly qualified research associates to join our Research and Development Departments.

Research Associates are sought in Molecular Biology, Protein Biochemistry, Cell Biology, and Monoclonal Antibody Production.

These positions offer the opportunity to study basic mechanisms of receptor ligand interactions and to use this information to design therapeutic agents effective in the treatment of several types of cardiovascular disease. Preference will be given to individuals with prior research and/or laboratory experience.

COR Therapeutics, Inc. offers competitive salaries, benefits and attractive equity positions to its employees combined with the challenge and opportunity to make a significant contribution to this new organization. To apply, please send *curriculum vitae* to COR Therapeutics, Inc., 256 E. Grand Avenue, Suite 80, South San Francisco, CA 94080, ATTN: Human Resources. EOE

COR Therapeutics, Inc.

UNIVERSITY OF CAMBRIDGE

University Assistant Lecturer
in the Department of Anatomy

Applications are invited from suitably qualified graduates, for the post of a University Assistant Lecturer in the Department of Anatomy to hold office from 1 October 1989 or as soon thereafter as possible. The Department has extensive and well-funded facilities for research, in various branches of neuroscience including brain research, neuroendocrinology and behavioural studies, molecular cellular and developmental biology.

University Assistant Lecturer in Biochemistry

Applications are invited for a University Assistant Lectureship in the Department of Biochemistry to hold office from 1 October 1989 or as soon thereafter as possible. Candidates should hold a PhD degree, or the equivalent, and have an outstanding record in research and enthusiasm for teaching.
Candidates with postdoctoral experience and interest in any area of biochemistry are welcome to apply.

Salary range: £10,460 to £14,500

Further information and application form from:
The Secretary, Appointments Committee, 19 Trumpington Street, Cambridge, CB2 1QA (Tel: 0223 334999 Fax: 0223 332355).
Closing date: 15 April 1989

(8712)A

INSTITUTE OF CANCER RESEARCH
Sutton, Surrey

TECHNICIAN

There is a vacancy for a **TECHNICIAN** to work in the **FLOW CYTOMETRY LABORATORY**. The laboratory runs a number of collaborative research projects with other teams in the Institute. It also provides a general service in the field of flow cytometry and cell sorting. This is one of the leading flow cytometry facilities in the UK and the post offers the right applicant an opportunity to gain expertise in a rapidly expanding field.

The post would suit someone with a degree (or equivalent) in a biological science. Previous experience in flow cytometry, although an advantage, is not essential as training will be provided.

Salary in the range £8172-£10905 (all inclusive).

Applicants are advised that smoking is prohibited in the majority of the Institute's premises.

Any enquiries should be addressed to Dr. M. G. Ormerod, 01-643-8901 ext. 4694.

Please send applications, in duplicate, with the names and addresses of two referees to **The Personnel Officer, the Institute of Cancer Research, 17a Onslow Gardens, London SW7 3AL** quoting reference number 3.89.T.N.84.

FUNDED BY THE CANCER RESEARCH CAMPAIGN.

POST-DOCTORAL SCIENTISTS : MOLECULAR GENETICS AND CELL BIOLOGY

CANCER RESEARCH CAMPAIGN HUMAN CANCER GENETICS RESEARCH GROUP

UNIVERSITY OF CAMBRIDGE

Three post-doctoral positions will become available from early summer 1989 in this newly-established research group funded by the CRC. The group will eventually comprise 15-20 benchworkers, and will be sited in new laboratories within the Department of Pathology close to other groups involved in molecular genetics, biochemistry and developmental biology. The group has a broad interest in inherited predisposition to cancer in man, but is focussed on the cloning and biology of the gene for multiple endocrine neoplasia, type 2. Each of the three scientists to be appointed will be responsible for a small team working jointly on this project. Two posts (one for a molecular geneticist, the other for a cell or developmental biologist) will be at a senior level; one (requiring some experience in molecular genetics) will be suitable for a first or second post-doc appointment. Contracts 3 years (junior post-doc) or 5 years with possibility of renewal; salaries on University scales £9,865-£19,310 pa. according to age and experience.

The University of Cambridge is an equal opportunities employer.

Applications, with the names and addresses of two referees should be sent to Dr. B.A. Ponder, who is presently located at: **Institute of Cancer Research, 15 Cotswold Road, Belmont, Sutton, Surrey SM2 5NG.**

Informal enquiries encouraged: phone Bruce Ponder on 01-643 8901 ext. 4693. (8736)A

UNIVERSITY OF NOTTINGHAM SCHOOL OF AGRICULTURE

DEPARTMENT OF PHYSIOLOGY AND ENVIRONMENTAL SCIENCE
AFRC Research Group on Hormones and Farm Animal Reproduction

Research Technician Grade 3

Applications are invited for the above post within the Department of Physiology and Environmental Science. The successful applicant will be part of a group studying the trophoblast factors involved in the maternal recognition of pregnancy in ruminants and will be required to carry out the radioammunoassay of hormones.

In addition, there may be a requirement to handle domestic animals.

This research post is funded until 31st December 1989 in the first instance, with probable renewal, and has a current salary scale £6,636 to £7,828 per annum for a 5 day, 37 hour working week.

Application forms are obtainable from: **The Administrative Assistant, University of Nottingham, School of Agriculture, Sutton Bonington, Nr Loughborough, Leics, LE12 5RD. Tel: Nottingham 484848 Ext: 8302.** Please quote Post Ref 89/06. (8698)A

POSTDOCTORAL POSITION

Available immediately for cell and molecular biologist to participate in a comprehensive study examining DNA repair mechanisms and cellular recovery processes and their relationship to radiation resistance in cultured insect cells. Emphasis will be on identification of DNA and proteins associated with the pronounced radioresistance. Experience in modern molecular biology techniques desirable. Please submit curriculum vitae and names of three references to:

Dr. T. M. Koval, Department of Oncology, Mayo Clinic, Rochester, MN 55905.

An equal opportunity/affirmative action employer. (NW3459)A

INSTRUCTOR POSITIONS IN MICROBIOLOGY

Responsibilities are to generate monoclonal antibodies against human lymphocytes. M.D. required and at least 2 years of postdoctoral training. Expertise in monoclonal antibody technology, the use of assays to screen antibodies, and immunochemical experience to purify and characterize such antibodies are required.

Submit curriculum vitae, description of research interests and names of 3 references to **Dr. Jonathan Uhr, Dept. Microbiology U TX Southwestern Med. Ctr., 5323 Harry Hines Blvd., Dallas, TX 75235-9048** by April 30, 1989. *UT Southwestern Med. Ctr. is an Equal Employment Opportunity institution.* (NW3475)A

PESTICIDE TOXICOLOGIST/ENTOMOLOGIST

The Department of Entomology, Washington State University invites applications and nominations for a Research, tenure-track, Assistant Entomologist Position located at Puyallup, WA. Conduct research on the movement of pesticides in the vegetable crop ecosystem of Western Washington (additional information available upon request). Ph.D. required, preferably in Entomology.

Candidates with Ph.D. in Toxicology (or a related science) with expertise in pesticide toxicology will also be considered.

Applications accepted through June 1, 1989. Send letter of application, statement of professional goals and research plan, curriculum vitae including a list of all publications, descriptions of research experience and goals, and a list including phone numbers of 5 referees to:

John J. Brown, Chair Search Committee, Department of Entomology, Washington State University, Pullman, WA 99164-6432. WSU IS AN EO/AA EDUCATOR AND EMPLOYER. Protected group members are encouraged to apply. (NW3442)A

POSTDOCTORAL POSITION IN MOLECULAR PARASITOLOGY

Available immediately for studies on the mechanisms of action of serveral antimalarial drugs, including recently recognized in this laboratory as the prototype of a new class of anti-malarial agents. A strong background in Biochemistry and Enzymology, with some knowledge of molecular genetics is required.

Further details are available and candidate should send curriculum vitae and names of three references to:

Prof. Richard M. Franklin, Biocenter — University of Basel, Klingelbergstrasse 70, CH-4056 Basel/Switzerland. (W5973)A

SENIOR LECTURER OR LECTURER IN MICROBIOLOGY

(Department of Plant And Microbial Sciences)

Applications are invited for th above position. Applicants shou have a Ph.D degree in Micr biology. Preference will be giv to a candidate with research expe ience in non-medical microbiolo and microbial metabolism. Th appointee will be expected to co tribute to the teaching of micr biology courses at all levels ar first-year biochemistry, and pursue an active research pr gramme including the supervisic of M.Sc. and Ph.D. students.

The Salary for Senior Lecture is on a scale from NZ$49,000 NZ$57,000 per annum and a rang from NZ$59,000 to NZ$63,000 p annum, and for Lecturers is on scale from NZ$35,000 NZ$42,500 (bar), NZ$44,000 NZ$46,000 per annum.

Further particulars and Cond tions of Appointment, quotir Position No.PL2, may be obtain from Appointments (36015 Association of Commonweal Universities, 36 Gordon Squar London WC1H 0PF.

Applications close with: Th Registrar, University of Cante bury, Private Bag, Christchurc New Zealand on 31 May 1989. (W5982)A

THE UNIVERSITY OF MANCHESTER DEPARTMENT OF CELL & STRUCTURAL BIOLOGY IN COLLABORATION WITH ICI PHARMACEUTICALS ALDERLEY PARK

POSTDOCTORAL RESEARCH ASSISTANT and **PREDOCTORAL RESEARCH ASSISTANT** required for a 3 year research project, supported by the ICI Strategic Research Fund, to investigate extracellular matrix molecules and their receptors in the control of extracellular matrix biosynthesis, cell behaviour and cell differentation in the developing mammalian palate. The project involves a variety of developmental, cell biological and biochemical techniques. Applicants should preferably have a background or expertise in at least one of these areas ie. biochemistry, cell biology, developmental biology. This fundamental project is part of a larger research effort within the department focussing on cell-matrix interactions in development and disease. There is a stimulating research environment, critical mass of personnel and well equipped laboratories. The project involves considerable liaison and collaboration with equally active and well equipped research groups at the nearby ICI Pharmaceuticals Research Laboratories. The posts are available immediately. Salary range £11,680-£15,720 p.a. (Associate) and £10,460-£11,680 p.a. (Assistant) depending on age and experience. Superannuation. Applications including full curriculum vitae and the names and addresses of two referees to Professor Mark W.J. Ferguson, Department of Cell & Structural Biology, the University, Manchester M13 9PL. (Tel: 061 275 6775). Closing date is March 31st, 1989. The University is an equal opportunities employer. (8697A)

FLUID FLOW MODELLER

The sandstone cementation, cation transport, heat and fluid movement in the 360 Myr old sedimentary basin of N. England is being researched by three Ph.D students. A central part of the project is to quantify mass transfer of minerals, heat and soil by **developing computer models** of ancient compactional fluid flow or diffusion through subsiding porous rock. This modeller will need a Ph.D, or a BSc. plus relevant experience, formal geological training is not necessary. Based at Glasgow University, with excellent VAX and SUN computing in Dept. Salary 3 yrs on 1A scale starting £11,015. Apply by 4 weeks after publication date to **Dr. R. S. Haszeldine, Applied Geology, Glasgow G1 1XJ. Scotland. Tel. 041-552-4400 ext 2148.** (8695)A

SHOULDN'T YOU BE FILLING IT?

UNIVERSITY COLLEGE OF SWANSEA

Lectureship in Molecular Genetics

Applications are invited for the vacancy of Lecturer Grade A in Molecular Genetics in the School of Biological Sciences. This is an appointment approved under the new Academic Appointments Scheme. The School of Biological Sciences is a large, well equipped and progressive department and offers a suitable candidate with a good research record, the opportunity to develop an active laboratory and to teach at all levels.

The apppointment will date from October 1, 1989 and will be made in the middle range of the scale: £9,260-£14,500 per annum together with USS/USDPS benefits, if required.

Informal enquiries may be made to Professor J A Beardmore, School of Biological Science (Tel 0792 295382: Fax 0792 295447) but further particulars and application forms (2 copies) must be obtained from the Personnel Office, University College of Swansea , Singleton Park, Swansea, SA2 8PP, to which office they should be returned by **Friday, April 14, 1989.** (8696)A

Saudi Arabia

The **King Faisal Specialist Hospital and Research Centre** in Riyadh, Saudi Arabia has fully equipped research laboratories. The objective of the **Research Centre** is to provide facilities for research into a broad range of disorders particularly those prevalent in Saudi Arabia. The Research Centre collaborates closely with the clinical departments in the 500 bed technically advanced hospital.

The DEPARTMENT OF BIOLOGICAL AND MEDICAL RESEARCH is currently seeking highly qualified individuals for the following positions:

SCIENTIST I - Ph.D. with 15 years experience and demonstrated international scientific distinction in immunochemistry research. Will head active research on immunochemical aspects of airborne allergens, tumor immunology, infectious diseases and immunological aspects of virology.

SCIENTIST III - Ph.D. with 5 years experience with a particular interest in oncogenes. Will work with the molecular biology group.

SCIENTIST III - Ph.D. with 5 years experience in the biochemistry of endocrine disorders. Will work on cancer and disease of the thyroid gland.

SCIENTIST III - Ph.D. with 5 years experience in the field of vitamin D metabolism and metabolic bone disease. Will work on disorders of calcium metabolism.

SCIENTIST III - Ph.D. with 5 years experience in biochemistry. Will work in research of diabetes mellitus.

Several positions available for:

RESEARCH ASSISTANTS - Ph.D. with 1-2 years experience with evidence of scientific achievement. Will support research in cancer, immunological disorders, infectious diseases, parasitic disorders, inborn errors of metabolism, metabolic bone, diabetes and thyroid disease.

TECHNICIANS - BS or MS with 3 years experience. Will support research mentioned above. Also, positions for technicians with training in microbiology, cardiovascular physiology, pharmacokinetics and analytical biochemistry.

The substantial tax savings and attractive benefits for a 24 month contract include:

- Relocation allowance and free furnished housing
- 7 day post leave and 13 holidays during each year of contract
- 30 day annual leave with a round trip ticket to point of origin
- Educational leave for Ph.D.'s
- Free medical and dental care and emergency leave
- Educational assistance for eligible dependent children

For further information and/or to apply, please send a detailed resume to: **HCA International Company, Dept. N-0316, P.O. Box 550, Nashville, TN 37202-0550** or call toll free **1-800-251-2561**, in London: **HCA International Ltd., 49 Wigmore St., London, England W1H 9LE** or call **935-7185.** HCA is an Equal Opportunity Employer.

ASSOCIATE/FULL PROFESSOR OF CONSERVATION BIOLOGY AND ECOSYSTEM MANAGEMENT

The University of Michigan, School of Natural Resources is seeking applicants for the position of Associate/Full Professor of Conservation Biology and Ecosystem Management.

Nine month, tenure-track research and teaching position with leadership responsibility of this new field of study. Positions may be filled by a person with PhD and primary training in either Biological or Social Sciences. However, if PhD and experience are in Social Sciences, the applicant must have one degree in Biology. Regional or national experience and commitment to this field are required together with demonstrated research performance commensurate with the appointment level.

The School of Natural Resources is an interdisciplinary, research-oriented professional school focusing on the development of policies and management programs promoting the protection and sustained use of renewable natural resources, and on the training of practitioners and researchers these ends.

Send curriculum vitae, statement of research interest, list of publications, transcripts of college work, and names of three persons able to evaluate leadership, research, and teaching skills to:

Dr. James E. Crowfoot, Dean, The University of Michigan, School of Natural Resources, 3512 Dana Building, Ann Arbor, MI 48109-1115.

This position will remain open until filled. First review of applicants on April 14, 1989. This position is subject to availability of funds. *The University of Michigan is a non-discriminatory, affirmative action employer.* (NW3453)A

POSTDOCTORAL POSITION IN MOLECULAR VIROLOGY

We are seeking a recent Ph.D. with strong background in molecular biology to join six investigators studying the molecular basis of herpes simplex and varicella zoster virus pathogenesis. Prior experience in virology is not required. Salary range: $21,000 to $25,000. Submit curriculum vitae and brief description of prior research to:

Lawrence Stanberry M.D., Ph.D.,
Infectious Diseases,
Children's Hospital Research Foundation (CHRF),
University of Cincinnati,
Elland and Bethesda Avenues,
Cincinnati, OH 45229.

CHRF is an Equal Opportunity/Affirmative Action Employer. (NW3444)A

CARDIOVASCULAR FACULTY POSITION

Applications are invited for a tenure-track faculty position in the area of Cardiovascular Physiology and Control of Circulation at the level of Associate or full Professor. Candidates must have a Ph.D. or M.D. degree and sufficient post-doctoral teaching and research experience commensurate with the expected level of appointment. This position will complement an interactive group of faculty with strong commitment to the study of cellular and integrative aspects of neural and endocrine control of physiological systems. The successful candidate will be expected to develop and maintain a strong independent research program and to participate in teaching the medical and graduate students. Interested applicants should submit by June 1, 1989 curriculum vitae, statement of research goals and accomplishments, summary of teaching experience, and the names of four references to:

Esmail Koushanpour, Ph.D.
Chairman, Search Committee
Department of Physiology
Northwestern University Medical School
303 East Chicago Avenue,
Chicago, Illinois 60611
Telephone: (312) 908-8220/7991

Northwestern University is an Affirmative Action/Equal Opportunity Employer. Hiring is contingent upon eligibility to work in the United States. (NW3437)A

THE UNIVERSITY OF SUSSEX
LECTURER IN SPACE PLASMA PHYSICS

Applications are invited from men and women with a background in plasma physics, and proven research expertise, for a Lectureship in Experimental Physics from 1st October 1989, for which a bid has been made to the UGC under the New Academic Appointments Scheme. It is intended that the age of the appointee should be significantly under 35.

The Space and Plasma Physics group at Sussex is involved in a range of well-funded collaborative projects concerned with both spacecraft-borne experiments, eg AMPTE, CRRES and CLUSTER missions, and ground-based experiments, eg the European EISCAT auroral radar project and related optical work. The group's interests include data analysis/interpretation, computational/simulation and development of novel instrumentation.

Salary will be within the Lecturer Grade A scale £9,260 to £14,500 per annum.

For an application form and further particulars of the post please send a self addressed envelope (9" × 6") to **Artemis Harman, Personnel Office, Sussex House, The University of Sussex, Falmer, Brighton BN1 9RH.** Applicants may discuss the post informally with the Chairman of Physics, Dr D S Betts (Tel: 0273-606755).
AN EQUAL OPPORTUNITY EMPLOYER (8773)A

KING'S COLLEGE LONDON
University of London
BIOMEDICAL SCIENCES DIVISION
LECTURESHIP IN ANATOMY AND HUMAN BIOLOGY

Applications are invited for the post of Lecturer in Anatomy and Human Biology. Applicants should have active research interests in, for example Cell Biology, Developmental Biology, Neurobiology, or some other appropriate field, and be prepared to participate in the teaching of science medical and dental curricula. Experience in human topographical anatomy teaching, while desirable, is not essential.

Salary on scale Lecturer A £9,260–£14,500 pa. + £1,650 London Allowance or Lecturer B £15,105–£19,310 p.a. + London Allowance according to age experience, etc.

For further details, contact **Professor K.E. Webster, Anatomy & Human Biology, King's College London, Strand, London WC2R 2LS (telephone 01-873-2484),** to whom completed applications should be returned by 30th April 1989. (8765)A

POSTDOCTORAL RESEARCH ASSOCIATE

Immediate Opening For Biochemist Or Chemist To Work On Development Of Biosensors Using Antibodies And Antigens Attached To Microelectrodes. Experience With Protein Chemistry And Antibodies Is Desirable, But Not Essential. The Successful Applicant Will Join A Multidisciplinary Team Of Biologists, Biochemists, Surface Chemists And Chemical Engineers Working On Bisensor Technology In The Electronic Design Center At CWRU. Excellent Salary And Fringe Benefits.

Write Or Call: **Prof. James E. Zull, Dept. Of Biology, Case Western Reserve University, Cleveland, OH 44106, 216-368-3572.**

CWRU Is An Equal Opportunity Employer. (NW3451)A

RESEARCH PROGRAM DIRECTORS

ornia Institute of Biological Research R), a non-profit institute, has recently been olished with financial support from Strata- in La Jolla, CA. The Institute is in a beauti- oastal location in close proximity to the Salk tute, Research Institute of Scripps Clinic, ical Biology Institute, La Jolla Cancer earch Center, and the University of Califor- San Diego. CIBR will consist of laboratories research interests in eukaryotic gene ulation, oncogenes, cellular and molecular sformation, control of immune responses, cular biology of differentiation, and mamma- development. CIBR Research Program ctors should demonstrate the ability to in funding from extramural granting agencies. earch Program Directors also will be aided significant core supplementation and may e as consultants to Stratagene with the ortunity to engage in collaborative projects. stigators with appropriate research inter- are encouraged to apply.

d curriculum vitae to: **Personnel, Califor- Institute of Biological Research, 99 North Torrey Pines Road, La Jolla, 92037.** (NW3487)A

SCIENTISTS
CARDIOVASCULAR RESEARCH

COR Therapeutics, Inc. is a recently established and rapidly growing biotechnology company located in the San Francisco Bay Area. We specialize in the development of novel therapeutics for cardiovascular disease. We are actively recruiting a few highly qualified scientists with proven track records to join our Research Department. These scientists will join a research effort directed at the study of molecular mechanisms underlying various aspects of cardiovascular disease. The primary focus will be on growth factors and growth factor receptors, and receptors mediating vascular cell interactions.

Molecular Biology

Expression of native, chimeric and mutant proteins. Experience with mammalian cell expression preferred. Objectives will be to use a molecular approach to understand protein function and to develop the use of expressed proteins as novel pharmaceutical agents.

Protein Biochemistry

Identification, isolation and characterization of structural and functional domains of ligands and receptors. Objectives will be to characterize structure-function relationships of these proteins and to use this information to develop receptor antagonists.

COR Therapeutics, Inc. offers competitive salaries, benefits, and attractive equity positions to its employees combined with the challenge and opportunity to make a significant contribution to this new organization. To apply, please send *curriculum vitae* to COR Therapeutics, Inc., 256 E. Grand Avenue, Suite 80, South San Francisco, CA 94080, ATTN: Human Resources. EOE. (NW3476)A

COR Therapeutics, Inc.

University of York
DEPARTMENT OF BIOLOGY

Postdoctoral Research Fellow

pplications are invited for the above AFRC-funded post, available nmediately for a period of three years. The project involves patch amp recording of channel activity in endomembranes and will focus n the role of calcium channels in signal transduction. Previous xperience with patch clamp would be advantageous, though train- ng in this regard can be provided. The appointee will join a well- quipped laboratory active in various aspects of stimulus-response oupling in plant cells.

tarting salary in the range £9,865–£11,680 per annum, with USS.

wo copies of applications, with full curriculum vitae and naming two eferees, should be sent by Tuesday 14 April 1989 to **Personnel Office, niversity of York, Heslington, YORK YO1 5DD,** from whom further articulars are available. Please quote advertisement reference number /6283. Informal enquiries to Dr D Sanders (tel: 0904 432825)

(8768)A

BIOGROWTH, INC.

ioGrowth, Inc., a biotechnology company located in the an Francisco Bay area, has an immediate opening for OLECULAR BIOLOGISTs to aid in the development of novel uman therapeutic agents. A Ph.D. is required in addition to t least two years postdoctoral experience, with particular mphasis in both cDNA cloning and the expression of genes bacteria or mammalian cells.

ioGrowth offers competitive salaries, benefits, and the pportunity to make a major contribution at a newly develop- ng company. Please send résumé and three references to

BioGrowth, Inc.

UNIVERSITY OF SUSSEX

Schools of Chemistry and Molecular and Biological Sciences

Multi-disciplinary Research:

Molecular Recognition Studies of Molybdenum Enzymes

Positions are available for *THREE* individuals, for up to three years, to join a multi-disciplinary team working on the structure and enzymic mechanisms of molybdenum enzymes. The work is supported in part by the SERC Molecular Recognition Initiative. In addition to conventional biochemical techniques, physical methods such as e.p.r., ENDOR and EXAFS spectroscopy will be used, as well as molecular biology, involving site-directed mutagenesis. Applicants should preferably have experience at the postdoctoral level relevant to one or more of the above, or to enzyme purification. However, a less well-qualified applicant, perhaps a new graduate in chemistry or biochemistry, would be considered for one of the positions and would be encouraged to register for a higher degree. In all cases those appointed will be encouraged to train in techniques in which they are not already experienced. Appointments will be made on the RA1A, or RA1B salary scales, as appropriate, at salaries of up to £12,760 or £8,675, respectively.

Applications, including detailed *curriculum vitae* and the names of two referees should be sent as soon as possible to **Dr. R.C. Bray, School of Chemistry and Molecular Sciences, University of Sussex, Brighton, BN1 9QJ, phone (0273) 678398,** from whom further particulars may be obtained.

An Equal Opportunity Employer. (8772)A

THE LONDON HOSPITAL MEDICAL COLLEGE
(University of London)

MOLECULAR BIOLOGIST

Postdoctoral or postgraduate research assistant required to join project on acetylcholinesterase genes from mosquito vectors of malaria. Includes DNA sequencing and PCR. Some DNA experience preferred. Funded by Wellcome Trust, with salary on 1A or 1B scale. Available from 1st April for one year in first instance. Applications and informal enquiries to **Dr Lucinda Hall, Dept of Medical Microbiology, The London Hospital Medical College, Turner Street, London E1 2AD (Tel: 01-377 7259)** as soon as possible. (8740)A

FACULTY POSITION — X-RAY CRYSTALLOGRAPHY

The Department of Biochemistry, Medical School at the University of Minnesota invites applications for a tenure-track faculty position at the Assistant or Associate Professor level. Candidates with professional distinction in research and writing and demonstrated effectiveness in teaching and advising will be considered for an Associate Professor position. Candidates demonstrating involvement in quality research accepted or published in peer-reviewed journals will be considered for an Assistant Professor position. Applicants should have a Ph.D. degree with expertise in x-ray crystallography and structural analysis of macromolecules. The successful applicant will be part of a group of scientists working in structural biology associated with the William F. Dietrich Chair program. The Structural Biology group complements a core of biophysical scientists in several departments in the Medical School and in the College of Biological Sciences. These departments maintain strong graduate programs in biophysics and molecular biology. The new opening includes ready access to state-of-the-art x-ray diffraction facilities and the Minnesota Supercomputer Institute.

Applications must be postmarked no later than June 1, 1989. Send curriculum vitae, a concise plan for future research, and the names of three references to:

Leonard J. Banaszak, Center for Structural Biology
Department of Biochemistry, Medical School
4-225 Millard Hall, 435 Delaware St. S.E.
University of Minnesota
Minneapolis, MN 55455

The University of Minnesota is an equal opportunity educational employer, and specifically invites and encourages applications from women and minorities. (NW3480)A

STRATAGENE HAS OPPORTUNITIES AVAILABLE IN THE FOLLOWING AREAS:

TECHNICAL SALES REPRESENTATIVES
Positions are available within the Southern California and Midwest Regions. These positions represent a unique opportunity for qualified individuals to participate in the development of a technical sales organization.
Requirements: BS Degree in Molecular Biology or related field. Prior sales experience preferred.

TECHNICAL SERVICE REPRESENTATIVES
Requirements: BS Degree in Biology and 2-3 years' lab experience in Molecular Biology. Previous customer experience preferred. Will be responsible for answering technical inquiries, writing technical literature and telemarketing from our La Jolla, CA office.

PRODUCT DEVELOPMENT ENGINEER
Requirements: BS Degree in Engineering and 3-5 years' experience in instrument design for medium to high volume production. Must be proficient in digital/analog design, packaging and product implementation. Hands on mechanical skills a must.

AUTOMATION PRODUCT DEVELOPMENT ENGINEER
Requirements: Masters or PhD in Biology or Biochemistry. Position involves the interaction of a mechanically oriented biologist with electrical/mechanical engineers to develop automated equipment for the molecular biology laboratory. Qualified individuals should have an interest in optomizing molecular biology procedures and protocols with the prospective of adapting these protocols to automation.

LABORATORY TECHNICIANS
Requirements: BS Degree in Molecular Biology with 2-3 years' practical working experience in a biotech environment.

QUALITY ASSURANCE TECHNICIANS
Requirements: BS Degree in Molecular Biology with a minimum of 2-3 years' work experience in a biotech environment. Must have knowledge of the following: DNA Sequencing, cloning techniques, plasmids, restriction and modifying enzymes, protein purification and DNA electrophoresis.

Stratagene offers a beautiful working environment, competitive salaries and excellent benefits. All qualified candidates forward resume of qualifications to:

Stratagene, Attn: Human Resources Dept.
11099 N. Torrey Pines Rd., La Jolla, CA 92037 (NW3486)A

AUSTRALIA
CSIRO DIVISION OF SOILS
RESEARCH OFFICER

We are seeking an enthusiastic Research Fellow with a research background in the fields of Fluid Mechanics/Hydraulics/Sedimentology/Soil Erosion to work in our well equipped Canberra laboratory on soil erosion by water. Particular attention will be given to the interaction between rain, shallow surface flow, vegetation and surface roughness on the erosion process.

The appointment is for a term of 5 years with a salary range of A$31,003 p.a. to A$45,177 p.a.

The successful applicant will have a PhD or equivalent qualification in fluid mechanics, hydraulics, soil erosion processes or related field; appropriate skills in mathematics and numerical modelling; good communication and collaborative skills. Practical experience with soil physical or hydrological experimental procedures in the laboratory and in the field is desirable.

Prospective applicants are invited to discuss the position with Dr. J. Williams phone (6177) 71 9511 or Dr. P. Walker phone (6162) 46 5318.

More information can be received by contacting Ms. G. Mortan phone (6162) 46 5322 FAX (6162) 47 5883, or Mrs. J. Clark phone (618) 274 9206 FAX (618) 338 1636.

Please send full C.V. including names of at least 2 referees and ref: AA301, to:

The Chief
CSIRO Division of Soils
G.P.O. Box 639
Canberra, A.C.T. 2601
Australia. (W5983)A

University of York
Department of Biology
Cancer Research Unit
Research Assistant

The above three year position is available for a graduate, or those who are about to graduate in the biological sciences, to investigate the role of oncogene activation and chromosome alterations in human colon cancer. The research will involve cell culture and molecular biology techniques.

Candidates should have, or expect to obtain, at least an Upper Second Class honours degree. The successful applicant could be eligible to register for a higher degree.

Salary will be on the range 1b scale for research and analogous staff, £8,675 – £11,680 per annum.

Informal enquiries can be made to Dr Colin Garner on 0904 432900.

Four copies of applications with full curriculum vitae and naming two referees, should be sent by Friday 7 April 1989 to the Personnel Office, University of York, Heslington, YORK, YO1 5DD, from whom further partiuclars are available. Please quote advertisement reference number 7/6282. There are no printed application forms. (8725)A

POSTDOCTORAL POSITIONS

Postdoctoral positions are available in cell, molecular and structural biology of membrane (D.W. Hamilton) and cytoskeletal systems (R.W. Linck). Membrane projects include: biogenesis during spermatogenesis, glycosylation, formation of the acrosomal, head and flagellar membranes, subsequent membrane maturation within the epididymis, and the function of membrane proteins. Cytoskeleton projects include: molecular structure and assembly of microtubules, gene structure and expression of microtubule proteins in development, and in vivo function of microtubules in cilia/flagella, centrioles/centrosomes and mitosis/meiosis. Experience is required in preferably more than one of the following: cytology, protein chemistry, immunochemistry, EM, diffraction methods, and/or recombinant DNA methods. Send curriculum vitae and three letters of reference to: **Dr. D.W. Hamilton or Dr. R.W. Linck, Department of Cell Biology and Neuroanatomy, University of Minnesota, 4-135 Jackson Hall, 321 Church Street, S.E., Minneapolis, MN 55455.** (NW3218)A

SEARCH RE-OPENED
TENURE-TRACK FACULTY POSITION
IN PALEOCEANOGRAPHY

The Institute of Marine Science, University of Alaska Fairbanks, has re-opened its search for a tenure-track faculty member in paleoceanography. The appointment will be with the Institute of Marine Science in the recently organized School of Fisheries and Ocean Sciences and involves research, graduate-level instruction, and direction of graduate student research. The Institute of Marine Science has a faculty of 24 and about 40 graduate students at the M.S. and Ph.D. level. Institute faculty are involved in a variety of research programs emphasizing arctic and sub-arctic seas and are actively planning university-wide programs addressing global change.

We seek a colleague committed to collaborative work in paleoceanography in a broad sense and welcome applicants bringing modern approaches from geology, physics, chemistry or biology. The appointee must hold a Ph.D. and will be responsible for developing an active research program in paleoceanography. We anticipate filling this position at the assistant professor level, but will consider a more senior appointment in exceptional cases.

Applicants should send (by April 30, 1989) a statement of research interests, a curriculum vitae, and the names and addresses of three references to:

William S. Reeburgh
Chair, Paleoceanographer Search Committee
C/O Director's Office
Institute of Marine Science
University of Alaska Fairbanks
Fairbanks, Alaska 99775-1080

Applications of finalists may be subject to public disclosure. Persons hired must comply with the new employment provisions of the Federal Immigration Reporting Act. The University of Alaska is an Equal Opportunity/Affirmative Action Employer, educational institution, and could become a year-round paradise with a little global warming. (NW3470)A

UNIVERSITY OF CAMBRIDGE
DEPARTMENT OF ZOOLOGY
CANCER RESEARCH CAMPAIGN
DNA REPAIR RESEARCH GROUP
RESEARCH ASSISTANT

A graduate research assistant is required to work on biochemical aspects of DNA repair. This post is available from 1 April 1989 and, for a suitable person, will extend for five years from 1 January 1990.

We are looking for an individual who can take responsibility for running and developing assays for DNA repair within a small team of scientists. Applicants should have a good first degree plus some experience in protein and/or nucleic acid biochemistry. A background in microbiology or molecular biology would also be useful.

Starting salary will depend on age and experience and will be in the University of Cambridge Research Assistant Scale (£9,260 to £12,760).

Applications in writing, together with c.v. and names and addresses of two scientific referees should be sent to **Mr J R Andrews, Departmental Secretary, Department of Zoology, Downing Street, Cambridge CB2 3EJ.**

Further information can be obtained informally by contacting Dr R T Johson (0223) 336672. (8703)A

POSTDOCTORAL RESEARCH ASSOCIATE

needed to join project on the structural characterization of glycoproteins (primarily the AIDS virus coat protein HIV gp120); emphasis is on the structures of the carbohydrates and their sites of attachment to the protein. Ph.D. degree required in chemistry/biochemistry; expertise in the characterization of carbohydrates using chemical techniques, mass spectrometry, and NMR spectroscopy is desirable. Salary $18,000-24,000 depending on experience. Send applications, which will be evaluated beginning April 15, 1989, to **Dr. Alan Darvill or Dr. Herman van Halbeek, Complex Carbohydrate Research Center, P.O. Box 5677, Russell Labs, Athens, GA 30613.** An AA/EEO institution. (NW3482)A

UNIVERSITY OF CAMBRIDGE

University offices: Vacancies under the New Academic Appointments Scheme

Applications are invited for the following University offices under the U.G.C. New Academic Appointments Scheme, which is designed to provide for the appointment of more younger staff to permanent academic positions. Appointments will be made from 1 October 1989 or as soon as possible thereafter, subject to confirmation by the U.G.C. of the provision of the necessary funds. The Appointments Committees concerned hope soon to be in a position to make these appointments.

University Lectureships, University Assistant Lectureships and Assistant Directorships of Research

Tenure

University Lecturers and University Assistant Lecturers: Appointments will be for three years; with the possibility, for a University Lecturer, of reappointment to the retiring age or, for a University Assistant Lecturer, of reappointment for two years and of promotion to a University Lectureship.

Assistant Directors of Research: Appointments will be for up to five years, with the possibility of reappointment for periods not exceeding five years at a time. The General Board, on the recommendation of the Appointments Committee concerned, are empowered to authorise the reappointment to the retiring age of an Assistant Director of Research who has held that office continuously for not less than five years.

Stipends

University Lecturers: £13,365 a year, rising by eleven annual increments to £20,615. There is no grade of Senior Lecturer.

Assistant Directors of Research: £13,365 a year, rising by nine annual increments to £19,310.

University Assistant Lecturers: £10,460 a year, rising by seven annual increments to £14,500.

University Assistant Lecturer in the Department of Geography. It is intended to appoint a Physical Geographer with particular interests in applying scientific approaches to the investigation of contemporary environmental problems.

Further information may be obtained from the Secretary of the Appointments Committee for the Faculty of Earth Sciences and Geography, Department of Geography, Downing Place, Cambridge, CB2 3EN, to who applications (ten copies) including a *curriculum vitae* and the names of three referees, should be sent so as to reach him not later than 5 April 1989.

Assistant Director of Research in the Institute of Astronomy. The main duties of the person appointed will be research and the supervision of graduate students. Applications are welcome from astronomers whose research relates to any part of the Institute's programme. Closing date 28 April 1989.

Further information about this office may be obtained from the Secretary of the Appointments Committee for the Faculty of Physics and Chemistry, Institute of Astronomy, Madingley Road, Cambridge, CB3 0HA, to whom applications (ten copies), including a *curriculum vitae* and the names of three referees, should be sent so as to reach him not later than the closing date given.

University Lecturer or University Assistant Lecturer in the Department of Zoology. Preference will be given to a person working in the area of *either* population biology, particularly with an interest in theoretical or empirical work on animal populations, *or* comparative physiology, particularly with an interest in animal movement and related subjects.

Further information may be obtained from the Secretary of the Appointments Committee for the Faculty of Biology 'A', Department of Zoology, Downing Street, Cambridge, CB2 3EJ, (Tel: 0223 336621) to whom applications (twelve copies) including a *curriculum vitae*, list of publications and the names of not more than three referees, should be sent so as to reach him not later than 19 May 1989.

University Lecturer or University Assistant Lecturer in the Department of Experimental Psychology. An appointment will be made in the general area of cognitive psychology, neuropsychology or developmental psychology, with preference given to someone working on computational modelling of cognitive processes or associative or neural networks. Closing date 17 April 1989.

University Lecturer or University Assistant Lecturer in Parasitology in the Department of Pathology. Candidates should have several years' post-doctoral experience in parasitology and in the application of molecular, biochemical or immunological techniques to the investigation of the developmental biology of parasites and of host/parasite relationships. The successful candidate will be expected to teach natural science, medical and veterinary students at undergraduate and postgraduate levels. Closing date 8 April 1989.

University Lecturer or University Assistant Lecturer in the Department of Pharmacology. The Department is about to move to new, custom-built premises and the lecturer will be provided with a well-serviced laboratory and office space. The successful applicant must be committed to a study of the mechanisms of drug action, the discovery of new drug targets and mechanisms and be competent at giving undergraduate courses. Furthermore the lecturer will be able to attract research support. There is no restriction of field for applicants, but preference will be given to those with proven expertise in the new electrophysiological methods or with abilities in molecular and/or cellular genetics. The successful applicant is expected to be able to relate his/her research to the activities of at least one of the major research groups in the department, such as receptors and ion channels, membrane transport especially in epithelia, or transduction and signalling mechanisms. Closing date 8 April 1989.

Further information about the duties and conditions of appointment of any of these three offices and an application form may be obtained from Dr D. Franks, Secretary of the Appointments Committee, 19 Trumpington Street, Cambridge, CB2 1QA, to whom applications (ten copies) including a *curriculum vitae*, list of publications and the names of not more than three referees, should be sent so as to reach him not later than the closing date given.

University Lecturer in Equine Medicine in the Department of Clinical Veterinary Medicine. Applicants should have a veterinary degree registrable with the Royal College of Veterinary Surgeons and some experience of the practice of equine veterinary medicine. Possession of a higher degree and/or an appropriate Diploma of the RCVS will be an advantage. The successful applicant will be expected to develop teaching in the field of equine medicine and a research programme in an appropriate area of that field.

University Lecturer in Clinical Pathology/Small Animal Medicine in the Department of Clinical Veterinary Medicine. Applicants should have a veterinary degree registrable with the Royal College of Veterinary Surgeons and some experience of the practice of small animal medicine, together with experience of clinical pathology, including clinical haematology and clinical biochemistry. Possession of a higher degree and/or an appropriate Diploma of the RCVS will be an advantage. The successful candidate will be expected to develop teaching in the fields of clinical pathology and small animal medicine and the related research programmes in an appropriate area of these fields.
Further information about the duties and conditions of appointment of these two offices may be obtained from the Secretary of the Appointments Committee for the Department of Clinical Veterinary Medicine, Madingley Road, Cambridge, CB3 0ES, to whom applications (twelve copies), including a *curriculum vitae*, list of publications, and the names of not more than three referees, should be sent so as to reach him not later than 17 April 1989. ANATOMICAL SOCIETY OF GREAT BRITAIN AND IRELAND

Anatomical Society Research Studentships

Applications are invited from Departments of Anatomical Sciences in the UK and Ireland for Research Studentships tenable in the Anatomical Sciences for a period up to three years. Students nominated by Departments must be graduates of British or Irish Universities and will be expected to register for a higher degree. The stipend will be commensurate with basic Research Council rates.

Anatomical Society Senior Visiting Fellowship

Applications are invited from Overseas Scientists for *one* Fellowship tenable for a period of less than a year in a Department of Anatomical Sciences in the UK or Ireland. Applicants should be of post-doctoral or comparable status and must have arranged sponsorship in the Department in which they intend to work. Some assistance towards travel and subsistence will be provided.

Further particulars should be obtained from the Acting Secretary, Dr Ian Whitmore, Department of Cell and Structural Biology, Stopford Building, University of Manchester, Oxford Road, Manchester M13 9PT, to whom applications should be sent by 28 April 1989.

(8606)A

BOTANIST

The National Tropical Botanical Garden (formerly Pacific Tropical Botanical Garden), the only national, privately supported, tropical botanical garden chartered by the United States Congress, is seeking to fill a full-time position available immediately. A special Hawaiian Islands Plant Conservation Center is being created at the Garden's headquarters on Knual with funds made available by the John D. and Catherine T. MacArthur Foundation. This will be a cooperative effort to establish a network of botanical gardens and research institutions in Hawaii. The successful candidate will coordinate efforts to establish this new center for the study and conservation of Hawaii's rare and endangered vascular plants and also develop and implement strategies for preserving these plants. A Ph.D. in a relevant field or equivalent experience is required. Experience working with Hawaiian plants is preferred. The ability to communicate well in writing and speaking and a knowledge of computers are advantageous. Salary is commensurate with experience. Initially this program will be supported by a 3-year grant from the MacArthur Foundation. Closing date for applications is March 31 1989 or until a suitable candidate is found.

Applicants should submit their curriculum vitae, description of research interests, and provide the names and addresses of three references to: **Dr. William L. Theobald, Director, National Tropical Botanical Garden, P.O. Box 340, Lawai, Kauai, HI 96765.**

The National Tropical Botanical Gardens is an Equal Opportunity Employer. (NW3469)A

POSTGRADUATE RESEARCH DEVELOPMENTAL NEUROBIOLOGIST

A position exists for research on the development of the nervous system of the leech. Current projects include the use of injection cell lineage tracers alone and in combination with other techniques to study the role of lineage in determining cell fate and factors governing differential cell migration in histogenesis. Expertise with techniques of microinjection and familiarity with leech embryology valuable; ideal candidate should be conversant with and able to develop new approaches from the fields of neurobiology, developmental biology, immunology and biochemistry. Salary range: 23,146-34,788 depending on qualifications. Send resume, description of research experience and bibliography by April 15, 1989 to **Dr. G.S. Stent, Department of Molecular Biology, University of California, Berkeley, CA 94720.**

The University of California is an Equal Opportunity/ Affirmative Action Employer. (NW3485)A

Sunderland Polytechnic operates a wide range of courses at degree and postgraduate level, and has a vigorous and successful record of consultancy and research, both of which are encouraged and promoted positively. With the advent of Corporate Status the Polytechnic is entering a new and challenging phase of its development. To maintain and extend the programme of work, applicants are invited for the following posts:

FACULTY OF SCIENCE
SCHOOL OF PHARMACEUTICAL AND CHEMICAL SCIENCES

Lecturer/Senior Lecturer in Formulation Science and Pharmaceutical Microbiology

Applicants are invited for **two** posts. The first post is responsible for teaching formulation science within the suite of courses in pharmaceutical sciences to honours degree level (Pharmacy, Chemical and Pharmaceutical Science) and Post Graduate level (Post Graduate Diploma in Quality Assurance) and to teach aspects of Law and its Administration as applied to the Practice of Pharmacy and Pharmaceutical Sciences.

The second post is responsible for teaching pharmaceutical microbiology for the same suite of courses and to Pharmacology students to honours degree level.

In both cases experience in research or industry or consultancy, in these areas will be an advantage. You will be required to participate in the research programme of the School.

Lecturer/Senior Lecturer in Analytical Biochemistry

You will be responsible for teaching analytical biochemistry and clinical chemistry to honours degree level and for co-ordinating developments in research, teaching and consultancy in these areas.

Salary Scales:
Lecturer: £8,451 to £15,369 per annum
Senior lecturer: £15,369 to £18,549 per annum

Application forms and further particulars can be obtained from Personnel Services, Sunderland Polytechnic, Langham Tower, Ryhope Road, Sunderland SR2 7EE or telephone (091) 5152429.

Closing date: 17th April 1989.

ASSISTANT/ASSOCIATE PROFESSOR OF TROPICAL PUBLIC HEALTH

The Department of Tropical Public Health at the Harvard School of Public Health is searching for an Assistant/Associate Professor to work on the biological aspects of malaria. The candidate should have a record of productivity on the study of malaria. The individual would join an active department employing a multidisciplinary approach to the study of a number of different protozoa and helminths causing disease in humans and would be expected to develop an independent research and teaching program. As a faculty member of this department, the person should be willing to become involved in projects on malaria research overseas.

Applicants should send curriculum vitae including list of publications and reprints of representative recent publications to:

***ad hoc* Committee on Malaria**
Department of Tropical Public Health
Harvard School of Public Health
665 Huntington Avenue
Boston, MA 02115

The Harvard School of Public Health is an equal opportunity employer and applications from women and minority groups are encouraged. (NW3481)A

Endowed Chair in Agricultural Biotechnology

The Oklahoma Agricultural Experiment Station has established an endowed chair to complement existing interdisciplinary research programs in Arthropod-Host and/or Phytopathogen-Host Interactions. The department of academic appointment will be dependent on the research interests and qualifications of the candidate. Qualifications include an earned doctoral degree in an appropriate area of science, six years of research experience, an excellent record of publications, the ability to successfully obtain outside support, and the ability to work cooperatively with other scientists. Startup equipment funding and continuing research support is available from a $1 million endowment. The biotechnology program is support by the new $45 million Noble Research Center for Agriculture and Renewable Natural Resources. Applications should include a letter indicating qualifications and a general description of research achievements and goals, a complete curriculum vita and the name and address of at least five references.

Applications will be accepted until a suitable candidate is identified. Nominations or applications should be sent to: **Dr. Tom Haan, 124 Agricultural Hall, Oklahoma State University, Stillwater, OK 74078.**

Oklahoma State University is an Affirmative Action-Equal Opportunity Employer. (NW3454A)

THE UNIVERSITY OF CALIFORNIA, SAN DIEGO

is seeking a Ph.D. applicant for a Postgraduate Researcher (PGR). Candidates should have experience in molecular biology and retrovirology or herpesvirology to conduct research in AIDS pathogenesis and the role of viral cofactors. Position available immediately for at least 2 years. Salary range based on University of California policy. Interested individuals should send curriculum vitae with a list of three references no later than June 30, 1989 to: **Stephen A. Spector, M.D., Associate Professor, Department of Pediatrics, UCSD Medical Center 225 Dickinson Street (H–814–H), San Diego, CA 92103.**

Equal Opportunity/Affirmative Action Employer. (NW3434)A

RESEARCH ASSOCIATE OR POSTDOCTORAL

position available 1989 to study biochemistry or molecular biology of protein degredation in the eye lens, particularly as it is affected by aging cataracts or nutrition. *Must be able to prove eligibility to work in the United States.* A list of our recent papers is available. Please send curriculum vitae and names of three references to:

Dr. Allen Taylor
USDA Human Nutrition Research Center
Tufts University
711 Washington Street Boston, MA 02111

An Affirmative Action/Equal Opportunity Employer. (NW3447)A

NATIONAL HEART AND LUNG INSTITUTE
University of London
Dovehouse Street, London SW3 6LY

An experienced histologist is required to join a newly formed pharmacology group in the Department of Cardiothoracic Surgery at the National Heart and Lung Institute and the Transplant Unit at Harefield Hospital. The main project involves the identification and localisation of receptors for vasoactive peptides in human cardiac tissue using in vitro autoradiography. This is to be run in parallel with functional studies measuring changes which occur in certain coronary conditions such as ischaemic heart disease. We are seeking a person with sound histological skills. Experience in any of the following areas would be advantageous — autoradiography, immunocytochemistry, photography, in situ hybridisation. The successful candidate would play an important role in our ongoing research commitment and would be encouraged to become involved in other specialised areas such as image analysis.

Applications (in the form of CV and names and addresses of two referees) should be addressed to **Professor M. Yacoub, The National Heart and Lung Institute, Dovehouse Street, London SW3 6LY.** Informal enquiries may be made to **Dr. M. Dashwood, Pharmacology Department, Harefield Hospital (0895-82-3737).** (8745)A

INSTITUTE OF ZOOLOGY
ZOOLOGICAL SOCIETY OF LONDON

DEVELOPMENTAL BIOLOGIST

ZOOLOGICAL SOCIETY OF LONDON

Required to work on systems for pre-implantation identification of genetic characteristics in primate embryos. The position provides an opportunity for the study of the embryology of the marmoset money, utilizing the Institute's extensive facilities for research on the marmoset, as well as for collaboration with molecular geneticists on the development and use of gene probes. The work will include investigations on gene expression on the developing embryo. The laboratories are equipped with appropriate embryo micromanipulation, culture and freezing facilities, and applicants should have experience in these techniques, as well as in surgical procedures; some knowledge of molecular biology would also be an advantage.

The position is for 5 years (3 years in the first instance), funded by a joint MRC/AFRC Programme Grant. Salary, aligned to University Lecturer scale, in the range £13,869–£19,116 plus London Weighting. Further details can be obtained from **Professor A P F Flint, Director, Institute of Zoology, Regent's Park, London NW1 4RY (tel: 01-722 3333),** to whom written applications, including names of three referees, full CV and publication list, should be sent by 13th April 1989. (8729)A

FACULTY IN NEUROPHARMACOLOGY

Tenure-track positions available in the Department of Pharmacology Louisiana State University Medical Center-Shreveport for accomplished researchers to develop independent research programs, and to participate in medical and graduate teaching.

Specialization in receptor mechanisms, neuropeptide, behavioral pharmacology, or nervous-immune system interactions preferred. Send CV, publications list, summary of completed research and future plans, and the names of three referees to **Dr. Adrian J. Dunn, Department of Pharmacology, LSUMC-S, P.O. Box 33932, Shreveport, LA 71130.** *EOE/AA* (NW3471)A

National Cancer Institute–Frederick Cancer Research Facility
BIONETICS RESEARCH, INC.–BASIC RESEARCH PROGRAM
POSTDOCTORAL FELLOWSHIPS

BRI–Basic Research Program Postdoctoral Fellowships are awarded for 1–2 years with stipends ranging from $24,000 to $30,000/year. The senior staff members and their research interests are

George Vande Woude: molecular basis of neoplastic transformation

Stephen Hughes: structure and function of HIV reverse transcriptase and integration protein; expression of cytoskeletal genes; retroviral vectors; transgenic birds

George Pavlakis: eukaryotic gene regulation; molecular mechanisms of cell transformation; molecular biology of HIV and pathogenesis of AIDS

Peter Johnson: mammalian transcription factors; molecular basis of tissue-specific gene expression

Stephen Oroszlan: immunochemistry and protein chemistry of retroviruses; structure and function of retroviral gene products; proteases

Alan Rein: retroviral genetics; functional analysis of retroviral genes using natural and synthetic mutants

Nancy Rice: molecular biology of retroviruses; oncogene expression

William Lijinsky: environmental carcinogenesis; mechanisms of carcinogenesis by nitrosamines and related compounds

Anthony Dipple: carcinogen–DNA interactions; polycyclic aromatic hydrocarbon carcinogenesis and mutagenesis

Robert Moschel: chemical synthesis of carcinogen–modified DNA; physical chemistry of carcinogen–DNA interactions; DNA adduct–induced mutagenesis in bacteria and mammalian cells

Christopher Michejda: biochemistry of carcinogen activation; DNA alkylation; chemotherapeutic agents

Jeffrey Strathern: cell type regulation; genome rearrangement, recombination, and DNA repair in yeast

David Garfinkel: molecular biology of the yeast retrotransposon Ty1; genome rearrangement and evolution

Amar Klar: gene regulation and homothallic mating–type switching in fission and budding yeast

Stuart Austin: chromosome stability in bacteria: regulation of plasmid replication and distribution of copies to daughter cells

Richard Fishel: molecular mechanisms and biochemistry of genetic recombination

Donald Court: regulation of gene expression by transcription initiation, transcription termination, and RNA processing

Neal Copeland: molecular genetics of murine leukemogenesis; developmental genetics; transposable elements and retroviruses

Nancy Jenkins: insertional mutagenesis by retroviral DNAs; transgenic mice; molecular biology of mouse development

Luis Parada: use of pluripotential stem cells to study molecular biology of development and the role of oncogenes; *in situ* hybridizations

Peter Donovan: development of the germ line; germ line mutations; cell matrix interactions

Alexander Wlodawer: structure of enzymes and oncogene products studied by X-ray diffraction

Irene Weber: crystallographic investigation of proteins, DNA, and protein–nucleic acid interactions

J. Ronald Rubin: crystallographic investigations of ligand–macromolecule interactions and drug–nucleic acid interactions

Send a curriculum vitae and the names of three references to Dr. Maurice L. Guss, BRI–Basic Research Program, NCI–Frederick Cancer Research Facility, P.O. Box B (Rm 48), Frederick, Maryland 21701.

RESEARCH FELLOWSHIPS IN GENETIC RECOMBINATION
£13,300-£16,000

The Imperial Cancer Research Fund is one of the largest independent cancer research institutes in Europe, employing approximately 400 scientists and clinicians. It has a wide ranging programme in fundamental, applied, and clinical cancer research.

Applications are invited for two postdoctoral positions:

(1) The mechanism of homologous pairing and strand exchange by the E. coli RecA protein.

(2) Resolution of recombination intermediates (Holliday junctions) in vitro.

Candidates for both positions should have experience in the techniques of molecular biology. Additional experience in cloning and gene manipulation would be advantageous for project (2). The fellowships are available at the ICRF's Clare Hall Laboratories situated 10 miles north of London and are tebable for a period of three years. Further information can be obtained from Dr S. West 0797-44444 ext 316.

Applications comprising a full curriculum vitae and the names and addresses of three referees should be sent to the Recruitment Officer, Imperial Cancer Research Fund, Lincoln's Inn Fields, London WC2A 3PX quoting reference 80/R.

Smoking is actively discouraged.

I M P E R I A L
CANCER RESEARCH FUND (8775)E

UNIVERSITY OF ZURICH, SWITZERLAND

POSTDOCTORAL FELLOWSHIP
in
MOLECULAR BIOLOGY

An enthusiastic post-doctoral scientist preferably with experience in the areas of cloning, gene transfer or site-directed mutagenesis, is required to join a multi-disciplinary team actively involved in research on chemically gated ion channels in the central nervous system (see Proc. Nat. Acad. Sci. 85, 7815, 1988).

The current project aims to study the role fo the GABA-receptor in regulating anxiety, vigilance and epileptic seizures. Investigation will focus on the structural heterogeneity, functional divergence and regulation of gene expression of this receptor family in normal and diseased brain.

Applicants for the three-year post, now available, should send CV, list of publications and the names of three referees to

Prof. H. Mohler,
Neuroscience Dept.,
Gloriastr. 32,
CH 8006 Zurich,
Switzerland.

THE MORRISON MEMORIAL POSTDOCTORAL FELLOWSHIP

The Department of Biochemistry, St. Jude Children's Research Hospital, is enlarging its research efforts in the area of the molecular and cellular biology of signal transduction. As part of this expansion, the Board of Governors has established a memorial fellowship in honor of Dr. Martin Morrison, the founding chairman of the Department. The research programs within the Department are well equipped and offer recent Ph.D. or M.D. graduates the opportunity to participate in energetic, multidisciplinary groups dealing with a range of basic and clinically oriented research. Current research programs within the Department include:

W.Y. Cheung: Regulatory properties and biological functions of calmodulin; Ca^{2+} regulated enzymes.

J. Cleveland: Growth factor regulation of gene transcription.

V.A. Fried: The ubiquitin system and post-translational regulatory pathways.

J.N. Ihle: Mechanisms of hematopoietic stem cell growth regulation, differentiation and transformation.

S. Jackowski: Regulation of phospholipid metabolism and the production of lipid-derived second messengers.

C. Rock: Hormone and growth factor stimulated phospholipase *C*.

E. Thomas: Antimicrobial and antitumor mechanisms of leukocytes.

Applicants should submit a brief statement of their research interests, curriculum vitae, reprints and names of three references to:

The Queen's University of Belfast and Trinity College, Dublin

RESEARCH FELLOWSHIPS

New Perspectives in DNA Photochemistry

Applications are invited from suitably qualified postgraduate or postdoctoral candidates (preferably citizens of the EEC) for two fellowships to conduct joint research on new developments in DNA photochemistry, emphasising laser-induced processes and sequence directed photosensitisation. One fellowship will be held at Queen's University (Dr. R.J.H. Davies, Department of Biochemistry) and one at Trinity College (Professors J.M. Kelly and D.J. McConnell, Departments of Chemistry and Genetics). The programme, funded by the EEC, involves collaboration with Professor C. Helene and Dr. Le Doan, Laboratoire de Biophysique, Museum National d'Histoire Naturelle, Paris. Generous travel funds are available to support consultation and secondments between the three laboratories.

The appointments, commencing as soon as possible, will be for one year with the possibility of renewal; salaries according to age, qualifications and experience.

Applicants, quoting ref. 89/S, should submit a curriculum vitae including the names and addresses of two referees to the **Personnel Officer, The Queen's University of Belfast, BT7 1NN, Northern Ireland** or to **Professor J. M. Kelly, Chemistry Department, Trinity College, Dublin 2, Ireland.** Informal telephone enquiries to Dr. Davies, Belfast (0232)-329241 ext. 2742 or Professor Kelly, Dublin (0001) 772941 ext. 1947. AGRICULTURAL AND FOOD RESEARCH COUNCIL INSTITUTE OF ANIMAL PHSYIOLOGY & GENETICS RESEARCH, BABRAHAM, CAMBRIDGE CB2 4AT

POST DOCTORAL APPOINTMENT IN DEVELOPMENTAL BIOLOGY

Applications are invited for a three year fellowship to work on molecular or cell biological aspects of oogenesis in mammals. The successful candidate will join a group in the Department of Molecular Embryology who are studying cell interactions, nuclear-cytoplasmic relationships and gene expression in growing oocytes. The work involves cell biology, molecular biology, nuclear transfer and transgenic techniques. The precise area of research will take into account the interests of the successful candidate.

Applicants should have practical experience in molecular biology or a desire to learn these skills. No prior experience in working on gametes is necessary.

The appointment will be for three years in the grade of Higher Scientific Officer. Salary in the range of £10,026–£13,460 according to qualifications and experience. 25 days annual leave and 10.5 public holidays. Non-contributory superannuation scheme. Application forms available from the Personnel Office quoting Ref: TAP35/HSO by 31 March 1989. (8774)E

RESEARCH POSTDOCTORAL FELLOWSHIP

Biochemical and molecular mechanisms of hormone (angiotensin) actions in heart. Receptor–G protein interactions, second messenger generation (Ca^{2+} and phospholipids), protein synthesis. Available: June 1989. Salary: PGY basis. **Contact: Kenneth M. Baker, M.D., Weis Center for Research, Geisinger Clinic, North Academy Avenue, Danville, PA 17822–2611.** (NW3439)E

STUDENTSHIPS

UNIVERSITY OF CAMBRIDGE
Department of Zoology

RESEARCH STUDENTSHIPS

A number of research studentships will be available in this Department from October 1989. The Research interests of the Department include Molecular Biology, Neurobiology, Developmental Biology, Behaviour Behavioural Ecology, Biomechanics, Ecology, Comparative Physiology and Evolutionary Studies.

Please write for details of these research opportunities to **Mrs J Schreiber, Department of Zoology, Downing Street, Cambridge CB2 3EJ.** (8701)F

UNIVERSITY OF LEICESTER RESEARCH STUDENTSHIPS IN GENETICS AND MOLECULAR BIOLOGY

Studentships are available for training in basic and genetic engineering techniques in a large multi-disciplinary Department. Applications will be considered for the following projects:

1. Bacterial pathogenicity in humans and domestic animals.
2. Bacterial plasmids; their maintenance and conjugative transfer.
3. Cell division mechanisms in *E. coli*; haemolysin secretion and synthesis and assembly of membrane proteins.
4. Differentiation and the mitotic cycle in *Physarum polycephalum*.
5. Function and expression of genes encoded by yeast plasmids; replication mechanisms of yeast plasmids.
6. Function and molecular biology of cytoskeletal roles of novobiocin-binding proteins.
7. Genetic and molecular control of biological and sexual behaviour in *Drosophila*.
8. Genetic variability in small mammal populations; mimicry of ecological processes by examination of effect of artificial selection on *Drosophila* populations.
9. Genetic control and analysis of carbon metabolism in *Aspergillus nidulans*.
10. Highly variable regions of human and animal DNA for use as genetic markers to identify family relationships, analysis of inherited disease and cancer, and use in animal breeding.
11. Protein secretion by Gram negative bacteria; protein engineering of antigens and epitopes.
12. Structure and function of human genes of clinical interest, with particular reference to the collagen family.

Studentships will be funded by SERC and MRC. Applicants should have or expect to obtain a 2.1 or 1st class honours degree in a Biological Science subject preferably including some knowledge of Molecular Genetics or Biochemistry.

Apply by submitting *curriculum vitae* including the names of two academic referees to the **Departmental Secretary, Department of Genetics, University of Leicester, Leicester LE1 7RH, from whom further details may be obtained.** (8755)F

MRC
Medical Research Council

MRC BRAIN METABOLISM UNIT
University Department of Pharmacology, 1 George Square, Edinburgh EH8 9JZ

RESEARCH STUDENTSHIPS

Applications are invited from final year students expecting to graduate with a first or upper second class honours degree in appropriate branches of science, medicine or veterinary medicine. The MRC Brain Metabolism Unit offers unique training in neuropharmacology and molecular neurobiology. The successful applicants will work on one of the following topics: neuropeptide-receptor interactions and intracellular signalling; molecular and cellular mechanisms in the regulation of neuropeptide and pituitary hormone biosynthesis and secretion; steroid regulation of gene expression. The successful applicants will be registered as research students in the University of Edinburgh. Applications including a full curriculum vitae together with the names of three academic referees should be addressed to the **Administrator, Mrs Anne Milligan, MRC Brain Metabolism Unit, University Department of Pharmacology, 1 George Square, Edinburgh EH8 9JZ,** no later than March 31, 1989. (8638)F

THE UNIVERSITY OF BIRMINGHAM
School of Biochemistry

RESEARCH STUDENTSHIP

funded by the HOME-GROWN CEREALS AUTHORITY

Applications are invited for a three-year PhD research studentship beginning in June, or as arranged, in 1989. The project is to investigate the fundamental biochemical causes of dormacy in barley grains. The successful applicant will join a team engaged in related studies.

Applicants having, or expecting, a I or II degree, which includes Biochemistry or Chemistry, should provide a full *Curriculum Vitae* and the names of two referees. Application forms are available.

Applications and requests for further details, to **Dr D E Briggs, School of Biochemistry, P O Box 363, Birmingham B15 2TT** by 19 April 1989. Telephone: 021-414-5418 quoting reference number 1193.

An Equal Opportunities Employer. (8753)F

MRC LABORATORY OF MOLECULAR BIOLOGY

A number of postgraduate studentships, tenable for up to 3 years, will be available in this laboratory for studies commencing in October 1989. Projects offered are:–

Dr. L. Amos	Studies on proteins involved in intracellular locomotion
Dr. A.C. Bloomer	Crystallographic studies of protein assemblies
Dr. T. Creighton	Experimental studies of protein folding *in vitro* and *in vivo*
Dr. P. Evans	Studies on allostery in phosphofructokinase
Dr. R. Kay	The molecular basis of morphogen action in *Dictyostelium*
Dr. J. Kendrick-Jones	Analysis of myosin structure and function in nonmuscle cells
Dr. J. Kilmartin	Biochemistry and genetics of mitosis in yeast
Dr. A. Leslie	Structural studies of chloramphenicol acetyl transferase
Dr. A. McLachlan	Maximum entropy methods for refining protein structures
Dr. M. Stewart	Directed mutagenesis studies of the molecular basis of interactions in the nuclear envelope
Dr. N. Unwin	3-D structures of membrane channels/ receptors

For further information applicants should write directly to **Dr. A.A. Travers, MRC, Laboratory of Molecular Biology, Hills Road, Cambridge CB2 2QH.** (8758)F

MRC

MEDICAL RESEARCH COUNCIL
Institute of Hearing Research
POSTGRADUATE STUDENTSHIP

The Biology section of the Institute of Hearing Research invites applications for a studentship starting in October 1989 for three years. Two projects are available:

1. Structural and functional development of the inner ear in mice with hereditary deafness, and the role of melanocytes in the development and function of the inner ear (Dr Steel).
2. Single unit responses of the central auditory system to complex sounds such as speech (Dr Palmer).

The institute has good facilities for single unit and gross electrophysiology, light and electron microscopy, excellent computing and workshop support, and in addition has collaborative links with molecular genetics laboratories for genetic studies of deafness.

Applicants should have,or expect to gain, a good degree in a Biological science.

For further details about the projects available, contact **Dr K P Steel, MRC Institute of Hearing Research, University Park, Nottingham NG7 2RD, telephone 0602 223431.** (8732)F

UNIVERSITY COLLEGE LONDON
Department of Physiology
RESEARCH STUDENTSHIPS

Studentships are available for October 89 on projects such as: Long-term potentiation in cerebral cortex, using isolated slices (with Dr L. Bindman).

Reciprocal interactions between pain afferents and inflammation (Dr B. Lynn).

Cell division cycle and second messengers, using techniques in cell physiology and molecular biology (Dr M. Whitaker).

And others in areas of cell and neurophysiology.

UNIVERSITY OF GLASGOW
SERC EARMARKED RESEARCH STUDENTSHIP
PLANT MOLECULAR SCIENCE GROUP

Applications are invited for an SERC earmarked research studentship to study the photoregulation of gene expression in plants. The project will be concerned with the molecular mechanisms linking photoreception to the transcription of specific nuclear genes.

Applicants should hold, or expect to obtain, a First or Upper Second Class Honours Degree in Plant Science, Molecular Biology, Biochemistry, or a related subject. Further details may be obtained from **Dr. G. I. Jenkins, Department of Biochemistry, University of Glasgow, Glasgow G12 8QQ**, to whom applications, including a C.V. and the names of two referees should be sent as soon as possible. Candidates may make enquiries by telephoning Dr. Jenkins on 041-339 8855, Extn. 5906. (8749)F

UNIVERSITY OF NOTTINGHAM
DEPARTMENT OF PHYSIOLOGY
AND ENVIRONMENTAL SCIENCE
MAFF STUDENTSHIPS

Embryonic antiluteolytic interferons and embryo mortality in cattle

Physiological and biochemical responses to changes in milking frequency and nutrient balance in dairy cows

Applications are invited for two

RESEARCH STUDENTSHIPS

ading to the degree of PhD, tenable from October 1989.

tudy 1 is concerned with the antiluteolytic effect of trophoblastic proteins alpha interferons) associated with the maternal recognition of pregnancy in attle, involving endocrine and receptor binding studies (a co-operative project vith Prof A P F Flint). The successful candidate will be attached to the AFRC esearch Group on Hormones and Farm Animal Reproduction.

tudy 2 is concerned with the relationship between cardiovascular and bio-hemical variables in unrestrained animals during the reproduction/lactation ycle and in response to changes in milking frequency.

Candidates should hold or expect to gain a First or Upper Second Class Honours degree in Biochemistry, Physiology, or in Agricultural Sciences or related disci-pline and, for Study 1, preferably have an interest in molecular biology.

Applicants should write, giving the names and addresses of two academic referees to **Professor G E Lamming (for Study 1) and to Dr T B Mepham (for Study 2) both at Department of Physiology and Environmental Science, University of Nottingham, Faculty of Agricultural & Food Sciences, Sutton Bonington, Loughborough, Leics LE12 5RD.**

Closing date 13th April. (8699)F

NEDO

NEW GRANT FOR INTERNATIONAL JOINT RESEARCH IN MATERIAL FUNCTIONS

New Energy and Industrial Technology Development Organization (NEDO), a semi-governmental agency supervised by the Ministry of International Trade and Industry (MITI), announces the commencement of a new international research grant programme.

The purpose of this programme is to promote creative research on material functions, and at the same time to contribute to the advancement of international exchange.

Research grants will be provided to the "International Joint Research Teams" which fulfil the following conditions.

1. Each team must be composed of four or more researchers.
2. Each team must consist of researchers from two or more different nationalities.
3. The research organizations where the researchers' major activities take place must be located in two or more countries and at least one of the organizations must be in Japan.

This programme supports basic research into material functions in the following areas:

1. Basic research on the elucidation and exploration of material functions.
2. Basic research into the practical use of materials.

Grants will be provided for up to four international research teams and the amount of each grant is up to 30,000,000 yen in FY 1989.

The application deadline is April 28, 1989. Application forms and further details may be obtained from the:

International Joint Research Division
Industrial Technology Department

THE CIBA-GEIGY PRIZE FOR RESEARCH IN ANIMAL HEALTH

At the end of 1989, Ciba-Geigy Animal Health will consider submissions for the award of 50,000 Swiss Francs to a scientific worker whose research might be applied to the improvement of animal health through the prevention or treatment of disease.

A submission may be made by the originator of the work or a recommendation may be made by a third party.

The work must be original to the nominee and, while it need not have been carried out during the current year, it should be novel either in concept or development.

The closing date for entries will be 31 May 1989.

Further details and copies of the rules governing the award may be obtained from:

Dr. Theodor Ramp
CIBA-GEIGY Limited

King Faisal International Prize

AN INVITATION TO SUBMIT NOMINATIONS FOR THE 1990 KING FAISAL INTERNATIONAL PRIZE IN SCIENCE

The General Secretariat of the King Faisal International Prize has the pleasure in inviting universities, academies, educational institutions and research centers throughout the world to nominate qualified candidates for

the King Faisal International Prize in Science, in the field of

CHEMISTRY

1. A nominee (a living person) must have accomplished an outstanding academic work on the Prize topic; benefiting mankind and enriching human thought in the prize field.
2. The work submitted must be original and published.
3. The work submitted must not have been previously awarded a prize by any international organization.
4. Nominations by individuals or political parties will not be accepted.
5. Nominations should include:
   (a) An official letter by a recognized educational institution, to each nominee, indicating the nominated works.
   (b) Typed C.V. of the nominee's academic background, experience and published works.
   (c) Ten copies of the works submitted for nominations.
   (d) A copy of the nominee's educational certificates.
   (e) Three recent colored photos 10 × 15 cm (4" × 6").
   (f) Full address and telephone number.
6. Nominations will be evaluated by a Selection Committee consisting of highly recognized specialists in the field.
7. More than one person may share the Prize.
8. The winners' names will be announced in January 1990, and the Prize will be awarded in an official ceremony at the headquarter of the King Faisal Foundation in Riyadh, Saudi Arabia, at a later date.
9. The Prize consists of:
   (a) A certificate in the winner's name containing an abstract of the work that qualified him/her for the Prize.
   (b) A gold medal.
   (c) A sum of three hundred and fifty thousand Saudi Riyals, (approximately US$93,333).
10. The latest date for receiving the complete nomination requirements will be (1st of August, 1989).
11. No nomination papers or works will be returned to the senders, whether or not the nominee was awarded the prize.
12. All correspondence must be sent by registered airmail to:

The General Secretariat
King Faisal International Prize
P.O. Box 22476, Riyadh 11495
Kingdom of Saudi Arabia
Telephone: 4652255
Telex 404667 PRIZE SJ

NATIONAL UNIVERSITY OF SINGAPORE

RESEARCH SCHOLARSHIP

Research Scholarships are available to outstanding university graduates registered for, or admissable to, master's and doctor's degree programmes by research at the National University of Singapore.

The Scholarships are tenable for one year in the first instance and, subject to satisfactory progress renewable annually for another two years.

The value of each Scholarship ranges from S$1000 to S$1500 per month (£1.00 = S$3.50 approximately) and is not subject to income tax; the actual quantum is determined on the candidate's qualifications and experience. No travel allowance is provided.

Research Scholars may be asked to assist in the work of the Departments to which they are attached for not more than six hours a week. They can earn up to S$5400 (gross) per annum at the current rate of remuneration from such departmental work.

The University will assist Research Scholars in obtaining hostel accommodation.

Application forms may be obtained from:

The Registrar,
NATIONAL UNIVERSITY
OF SINGAPORE
10 Kent Ridge Crescent
Singapore 0511
Republic of Singapore

NUS Overseas Office
5 Chesham Street
London SW1, UK

In your request for application forms, please state:-
(a) the field of research you intend to undertake; and
(b) your highest educational qualification.

Applications should be received by the Registrar, National University of Singapore preferably by 31 May 1989. (W5962)H

SEMINARS & SYMPOSIA

Symposium on the Development of the Vascular System 23-26 April '89, Madison, WI.

Topics include: Embryonic vasculogenesis; Endothelial cell differentiation; Cell-matrix interactions; Vascular addressins; Chemotaxis; Angiogenic factors. Speakers: Robert Auerbach, Dianna Ausprunk, Eugene Butcher, Edward Clark, Peter Ekblom, Richard Feinberg, Judah Folkman, Lewis Holmes, David Hootnick, Roger Markwald, Drew Noden, David Packard, Thomas Poole, Werner Risau, Hannu Sariola, Glenn Scherer, David Zaleske, Sally Zigmond. Wellcome Summer School 1989

A Practical Course

DNA RELATED METHODS IN HUMAN GENETICS:

July 14th-23rd 1989

Division of Biochemistry, United Medical and Dental Schools of Guy's and St. Thomas's Hospitals, Guy's Campus, London.

An intensive laboratory based course to introduce participants to modern methods of DNA analysis.

Programme:

1. Pulse-field gel electrophoresis (PFGE) – DNA digests, blotting, preparation and labelling of probes.
2. Mapping by PFG.
3. Analysis of large DNA fragments cloned in yeast artificial chromosomes (YACS).
4. Gene amplification by the polymerase chain reaction.

Informal tutorials and evening seminars (by invited speakers) will supplement the laboratory sessions.

Course Directors:
KAY E. DAVIES, ANNA-MARIA FRISCHAUF and WILLIAM BROWN.

Invited Speakers:
DUNCAN CAMPBELL, NICK HASTIE, MARTIN HOOPER, ED SOUTHERN, PAUL TRAVERS.

Participants:
Applicants should be post-doctoral scientists (or close to) engaged in clinical, veterinary or basic biomedical research. All participants will be expected to have a basic competence in recombinant DNA techniques.

Applications:
There are no formal application forms, but applicants should send a copy of their full **curriculum vitae** together with a 300 word outline of their research plans to:-
Dr. Pelin Faik, Course Coordinator, Division of Biochemistry, UMDS, Guy's Campus, London Bridge, London SE1 9RT. (Tel: 01-403 6998) (FAX: 01-407 5281)
Closing date for applications is April 30th.
This is a re-advertisement since it has proved possible to increase the number of places available. Previous applicants should **not** re-apply. Further information may be obtained by contacting Dr. Faik.

EMBO COURSE

CRYO SECTION IMMUNOLABELLING AND QUANTITATION

EMBL, HEIDELBERG AUG 14–24, 1989

This course will consist of two parts. *Part A:* 6 days of practical and theoretical details of cryo-sectioning for immunocytochemistry, primarily for electron microscopy. Teachers will include: J. Dubochet, G. Griffiths, Lucocq, J.W. Slot and K. Tokuyasu. *Part B:* 3–4 days theory and practice tereology for biology. Teaching staff: L. Cruz-Orive, H.J. Gunderson, oeler and T. Mattfield. At the end of this part the aim is to integrate of stereology for quantitation in immunocytochemistry.

e is primarily aimed at Ph.D. students as well as more experi- ntists. Applicants should send a brief CV which should include a of their research interests. Preference will be given to those ho need to use both immunocytochemistry and quantitative s in their research.

ROYAL SOCIETY DISCUSSION MEETINGS
MAY 1989

24 and 25 May
'THE FAST-NEUTRON-BREEDER FISSION REACTOR'

Organized by Sir Peter Hirsch, F.R.S., Dr T.N. Marsham, F.R.S., Dr R.S. Pease, F.R.S. and Dr B.L. Eyre.
Speakers: R.S. Pease, F.R.S., G. Vendryes, M. Koehler, M.F. Troyanov, J.D. Griffith, S. Sawai, A.M. Broomfield, R. Lallement, R.H. Allard, L.E.J. Roberts, F.R.S., H-H. Hennies, B.L. Eyre, M. Rapin, T.N. Marsham, F.R.S. and J.G. Collier.

The Discussion Meeting on 25 May will be followed by the Lecture at 17.00 given by the Rt. Hon. the Lord Perry of F.R.S. The title of his lecture is **'Science and education'**

Registration details (no fee for attendance): **Miss C.A (ref. DMN/CAJ), The Royal Society, 6 Carlton House London SW1Y 5AG. (Tel: 01-839 5561, ext. 278. Tel**

E N I I : European Network of Immunology Institutes

The fourth European Network of Immunology Institutes Conference, chaired by D. Mathis a R. McDonald, will be held on the island of Les Embiez, France from May 16th-20th.

There will be seven plenary sessions on: B cell differentiation, Antibody structure and engineerir T cell differentiation, The (antigen-MHC-T cell receptor) complex, Hematopoietic stem cel early lymphoid precursors, Molecular aspects of autoimmunity, Inherited immune disorders.

The 1st Neils Jërne lecture will be given by Dr. B. A. Askonas (London/Oxford).

Influenza Virus, a Challenge to the Immunologist.

Speakers will include: K. Rajewsky, M. Reth, C. Goodnow, M. Harnett, F. Kroese, R. Poljak, S. War A. Rees, J. Anglister, H von Boehmer, U. Staerz, J. Allison, A. Lanzavecchia, S. Buus, C. Benois M. Davis, B. Devaux, N. Le Douarin, I. Weissman, P. Kincade, J. Visser, J. Gallagher, H. Wekerle, H Acha-Orbea, J. Epplen, R. Kofler, I. Förster, B. Jordan, C. Terhorst, R. Levinsky, A. Fischer, W. Reiti

Participation limited to 150. Time will be given for registered participants to present data as te minute papers or in a poster session.

Students and postdoctoral fellows are encouraged to apply. A limited number of bursaries will be available.

Applications should include a 200 word abstract and a 1 page C.V., as well as telephone and telefax numbers, to:

1989 ENII Conference, c/o Dr. Diane Mathis, INSERM U. 184/LGME, 11, rue Humann, 67085 STRASBOURG CEDEX FRANCE

The registration fee, which includes transport from Marseille Airport and full board, will be 2,300 FF.

DRUG DELIVERY OF PROTEINS

June 12, 13, and 14, 1989,
Boston, Massachusetts, U.S.A.

TMG announces a conference on the key enabling technologies for biotechnology therapeutics for the 1990's

Planned speakers include key individuals from:

Alza	Elan	Osmed
California Biotechnology	The Liposome Company	Syntex
Cetus	Liposome Technology	University of Southern California
Ciba-Geigy	Nova Pharmaceuticals	Technology Management Group

Planned presentations include:

Controlled release of peptides
Applications of polymers for delivery of growth factors and other peptides
Delivery of growth factors for wound healing
Delivery of interferons
Delivery of interleukin-2
Worldwide market opportunities and activities of companies
Biodegradable polymer matrix for growth factor delivery to hard tissue
Monoclonal antibody-based delivery
Liposomes for peptide delivery
Nasal administration of hormones, including clinical results
Non-invasive mucosal delivery of growth factors, hormones and other peptides
Transdermal delivery of peptides
Red blood cells as a delivery vehicle
Lipid-based delivery of growth hormones and other peptides
Site-specific targetting of therapeutic proteins

To reserve a place, or for more information, contact:

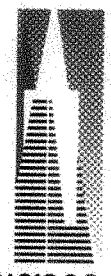
Technology Management Group
25 Science Park, New Haven, Connecticut 06511 U.S.A.
Tel: (203) 786-5445, Fax: (203) 786-5449 (NW3452)C

CONFERENCE

The Second International Workshop on Cytokines
10 to 14 December 1989
Hilton Head, South Carolina

GOALS: a) to encompass and integrate the most recei data concerning cytokine synthesis, release, regulatio actions, and interactions, and b) to assess the in viv effects of these cytokines on cell, tissue, organ, and o ganism metabolism, physiology, and immunity. TOPICS structure, gene expression, regulation of synthesis an release, receptors and post receptor events, cytokir activities, alone and in combination, assays for and inhib tors of the cytokines. CYTOKINES TO BE CONSIDERED the interleukins, the interferons, TNF, TGF, PDGF, chem tactic factors, the various colony stimulating factors, bor and connective tissue growth factors, as well as new identified activities/factors.

INVITED SPEAKERS: Robert Friedman (interferons Tadamitsu Kishimoto (IL-6), Thomas Maciag (ECGF Lloyd Old (TNF), Russell Ross (PDGF), Ruth Sager (GRO Arthur Silverstein (historical perspective). The content c the rest of the meeting will be based on submitted a stracts.



Abstracts will be published in the premiere issue CYTOKINE (W B Saunders Company). Deadline for recei of abstracts is 15 June 1989. For abstract forms, meetin information, and registration forms contact: **Sherwoo M. Reichard, Cytokines, c/o RES Society, Box 3044 MCC Augusta, GA 30912 USA.** (NW3168)C

Typesetting: Text Generation Ltd, London WC2 and J. W. Arrowsmith Ltd, Bristol. Printing: Chase Web Offset, Plymouth, and The Riverside Press Ltd, Whitstable, Kent, William Byrd Press Inc., Richmond, V USA and Obun Printing Co., Bunkyo-ku, Tokyo, Japan. CUSTOM cDNA AND GENOMIC LIBRARIES IN A FLASH

With Stratagene's Innovative Vectors And Improved Gigapack™ II Gold Packaging System

Stratagene offers a custom cDNA and genomic library service. Each library is constructed using Gigapack™ II Gold packaging extract (our newest packaging system: mcrA, mcrB, mrr–, hsdr–) and your choice of innovative cloning vectors.

cDNA Libraries

Send us your poly (A+) enriched mRNA (we recommend the use of Stratagene's RNA isolation kit for isolating total RNA - catalog #200345). We will construct a library containing from 1×10^6 to 1×10^7 primary recombinant plaques depending on the integrity of the mRNA. Stratagene will also amplify your library at no extra charge. Libraries will be constructed in one of the following lambda phage vectors of your choice: The Lambda Zap®II vector, the Uni-Zap™XR vector, Lambda gt10, or Lambda gt11 vectors.

Genomic Libraries

Send us your genomic DNA. Stratagene will perform partial or complete digests and size fractionate the DNA. Stratagene will construct a library containing from 1×10^6 to 1×10^7 primary recombinant plaques. If desired we will amplify your library at no extra charge. Libraries can be constructed with the Lambda FIX™ II vector, the Lambda DASH™ vector, Lambda EMBL3, EMBL4, or the cosmid vector pWE.

Pre-Constructed Libraries

Stratagene offers a large selection of pre-constructed libraries. Most are prepared with Stratagene's innovative vectors and are available for immediate delivery. Please call for information on our latest selection. Stratagene guarantees your complete satisfaction.
